- 600 V ⅒-30 A Class CC and Midget fuse cover puller that offers increased protection when removing fuses
- Simple removal without the need for a separate puller
- Meets Dead Front requirements
- Easily gangable with 5⁄16" diameter wire
- For use with all 600 V Class CC and Midget ⅒-30 A fuses
- Label provided for easy fuse identification

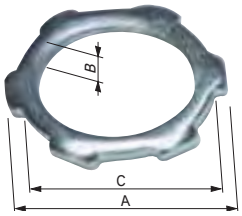
Rigid Threaded Nipples



Use:
Threaded nipples are used to extend a length of threaded Rigid or IMC Conduit according to the pipe size and length desired. May also be used to connect two steel outlet boxes or metal enclosures together.

RIGID CONDUIT

ENGINEERING SPECIFICATIONS:

Listed Solid E-123774
Stranded E-156879

Standards:

Underwriters Laboratories Standards UL-83, UL-1063, UL-758
AWM Spec 1316, 1317, 1318, 1319, 1320, 1321
ASTM Stranding Class B3, B8, B787
Federal Specification A-A-59544
Canadian Standards Association C22.2 No. 75
NEMA WC70/ICEA S-95-658
Institute of Electrical and Electronics Engineers
ARRA 2009; Section 1605 "Buy American" Compliant

CONSTRUCTION:

Conductors:

Solid, uncoated copper conductors per ASTM-B3
Stranded, uncoated copper conductors per ASTM-B3, ASTM-B787 and ASTM-B8

Insulation:

Color-coded Polyvinyl Chloride (PVC), heat and moisture-resistant, flame-retardant compound per UL-1063 and UL-83

Applications:

Type THHN/THWN-2 building wire is intended for general purpose applications as defined by the National Electrical Code (NEC). Type THHN/THWN-2 is permitted for new construction or rewiring for 600-volt applications. Applications requiring Type THHN or THWN-2: the conductor is appropriate for use in wet or dry locations at temperatures not to exceed 90°C or not to exceed 75°C in oil or coolants. Applications requiring Type MTW: the conductor is appropriate for use in dry locations at 90°C, or not to exceed 60°C in wet locations or where exposed to oils or coolants. Applications requiring Type AWM: the conductor is appropriate for use at temperatures to not exceed 105°C in dry locations.

Features:

Slick, Nylon outer jacket for easy pulling. VW-1 rated 14 AWG - 8 AWG. All sizes are rated gasoline and oil-resistant II.

Jacket:

A tough, polyamide, Nylon outer covering per UL-1063 and UL-83.

The Action Designated Above is in Accordance with the Following Legend:

A – Furnish as Submitted
B – Furnish as Noted
C – Revise and Re-submit
1. Not enough information for review.
2. No reproducible submitted.
3. Copies illegible.
4. Not enough copies submitted.
5. Wrong sequence number.
6. Wrong resubmittal number.
7. Wrong Spec. Section.
8. Wrong form used.
9. See Comments.

D – Rejected
E – Engineer's Review not Required
1. Submittal not required.
2. Supplemental Information. Submittal retained for Information purposes only.
3. Information reviewed and approved on prior submittal.
4. See Comments.

Review is for general compliance with Contract Documents. No responsibility is assumed for correctness of dimensions or detail. Contractor is required to specify deviations from contract requirements. Lack of exceptions noted by Engineer does not waive Contractor's obligation to comply with Drawings and Specifications.

Comments:
Items reviewed and confirmed to meet requirements
(Reviewed Material in Parentheses)
Issues in Bold

Material conforms to electrical drawings and are equivalent with the previous submittal. Revision to this submittal was performed as schedule and availability issues would ensue with the previous submitted material.

Okoguard® URO-J

15kV Underground Primary Distribution Cable-Jacketed

Red Identification Stripes

Filled Strand Aluminum Conductor/105°C Rating
100% and 133% Insulation Levels

A Conductor - Stranded Aluminum with Filled Strand - Water Swellable Power
B Strand Screen - Extruded Semi-conducting EPR
C Insulation - Okoguard EPR
D Insulation Screen - Extruded Semi-conducting EPR
E Concentric Conductor-Bare Copper Wires
F Encapsulating Jacket-Okolene with Extruded ID Stripes & NESC lightning bolt

Insulation

Okoguard is Okonite's registered trade name for its exclusive ethylene-propylene rubber (EPR) based, thermosetting compound, whose optimum balance of electrical and physical properties is unequaled in other solid dielectrics. Okoguard insulation, with the distinctive red color and a totally integrated EPR system, provides the optimum balance of electrical and physical properties for long, problem free service.

The triple tandem extrusion of the screens with the insulation provides optimum electrical characteristics.

The compressed conductors are filled with a water swellable agent. This construction slows the migration of water through the strands in the event of a mechanical dig-in followed by external exposure to water.

An insulation screen of ethylene-propylene rubber is extruded over the insulation. The copper concentric wires are uniformly spaced around the insulation screen. The overall polyethylene jacket provides protection against mechanical damage and corrosion.

Product identification is provided through the use of three red stripes placed 120° apart in the black jacket, with an NESC lightning bolt.

Applications

Okoguard URO-J cables provide maximum circuit longevity in underground residential distribution systems. They can be buried directly or installed in underground ducts or conduits.

Specifications

Central Conductor: Aluminum per ASTM B-609, Class B stranded per B-231.

Filled Strand: Water swellable powder meets or exceeds ICEA T-31-610 water penetration resistance and ANSI/NEMA class A connectorability requirements.

Conductor Screen: Extruded semiconucting ethylene-propylene rubber meets or exceeds the requirements of ICEA S-94-649 and AEIC CS8.

Insulation: Extruded Okoguard meets or exceeds the requirements of ICEA S-94-649 and AEIC CS8.

Insulation Screen: Extruded semiconducting ethylene-propylene rubber meets or exceeds the requirements of ICEA S-94-649 and AEIC CS8.

Concentric Conductor: Bare copper wires.

Jacket: Black Okolene with red extruded stripes meets or exceeds the requirements of ICEA S-94-649 for polyethylene jackets.

Product Features

- Triple tandem extruded, all EPR system.
- Okoguard cables meet or exceed ICEA standards.
- Meets RUS 1728.204 for cables with filled strand or solid conductor and 133% insulation level.
- 105°C continuous operating temperature.
- 140°C emergency rating.
- 250°C short circuit rating.
- Excellent corona resistance.
- Low dielectric constant and power factor.
- Screens are clean stripping.
- Exceptional resistance to “treeing”.
- Filled strand conductor.
- Moisture resistant.
- Overall jacket provides extended life.
- Excellent resistance to most chemicals.
- Can be listed by UL as Type MV-90 on Special Orders.
- Cable listed by CSA to C68.5 on special orders.
- Design Options:
  Additional conductor sizes
  Copper central conductor
  Copper flat strap concentric neutral
  Product identification via colored jackets.
  Semiconducting jackets.
- Improved Temperature Rating.
Okoguard insulation system has been tested and qualified for operation at 105°C continuous and 140°C emergency operating temperature.
- Minimum installation temperature of -40°C.

COOPER POWER SERIES

600 A 15/25 kV class BOL-T™ deadbreak connector

COOPER Power Systems - 600A 15kV 500mcm Deadbreak T-Body Kit with Test Point & Shield Adapter Kit (Complete Kit for Shielded Cable)

COOPER Power Systems - 600A 15kV #2 Deadbreak T-Body Kit with Test Point & Shield Adapter Kit (Complete Kit for Shielded Cable)

General

Eaton's Cooper Power™ series 600 A, 15/25 kV Class BOL-T™ deadbreak connector is used to terminate high-voltage underground cable on deadfront apparatus such as transformers, switches and switchgear. It is fully shielded, submersible and meets the requirements of IEEE Std 386™-2006 standard – "Separable Insulated Connector Systems".

The capacitive test point on the insulating plug provides a means of testing the circuit without disturbing the bolted connection.

In addition to the capacitive test point feature on the insulating plug, Eaton's Cooper Power series offers an optional capacitive test point similar to the test points on Eaton's Cooper Power series 200 A Elbows. This allows the use of the Type "TPR" series fault indicators, and provides a hotstick operable means of determining circuit condition when used with high impedance voltage sensing devices designed for test points.

BOL-T connectors are designed for use on solid dielectric cable (XLPE or EPR) with extruded semi-conductive shields and concentric neutral, with or without a jacket.

Installation on jacketed concentric neutral cable may require additional sealing material. Cold shrinkable adapters are available for tape shield, linear corrugated and drain wire cable adaptation for use with deadbreak connectors.

900 AMP rating

The BOL-T connector is rated for 900 A continuous when used with a coppertop compression connector, copper insulating plug, copper stud and copper bushing or junction. If a 900 A rating is desired, specify a "C" as the 9th digit when determining your part number. See Step 3, page 5.

Interchangeability

All Eaton's Cooper Power series 600 A deadbreak connectors conform to the electrical, mechanical and dimensional requirements of IEEE Std 386™-2006 standard. The connectors can be used on any comparably rated bushing interface that also meets the requirements of this standard. In addition all cable adapters, insulating plugs, compression connectors and other component parts are designed to be interchangeable with those currently available from other major manufacturers that also comply with IEEE Std 386™-2006 standard.

Installation

A torque wrench and one-inch socket are used to tighten the insulating plug through the compression or shear bolt connector within the T-body onto a de-energized 600 A bushing interface. Refer to *Service Information S600-10-2 600 A 15/25 kV Class BOL-T and Separable Splice Connector Assembly Installation Instructions* for details.

Production tests

Tests conducted in accordance with IEEE Std 386™-2006 standard:

- ac 60 Hz 1 Minute Withstand
  - 40 kV
- Minimum Partial Discharge Extinction Voltage
  - 19 kV

Tests conducted in accordance with Eaton's Cooper Power series requirements:

- Physical Inspection
- Periodic Dissection
- Periodic X-ray Analysis

Table 1. Voltage Ratings and Characteristics

Description	kV
Standard Voltage Class	25
Maximum Rating Phase-to-Ground	15.2
ac 60 Hz 1 Minute Withstand	40
dc 15 Minute Withstand	78
BIL and Full Wave Crest	125
Minimum Partial Discharge Extinction Voltage	19

Voltage ratings and characteristics are in accordance with IEEE Std 386™-2006 standard.

Table 2. Current Ratings and Characteristics

Description	Amperes
Continuous	600 A rms
4 Hour Overload	900 A rms
Short Time	40,000 A rms symmetrical for 0.17 s 27,000 A rms symmetrical for 4.0 s

Current ratings and characteristics are in accordance with IEEE Std 386™-2006 standard.

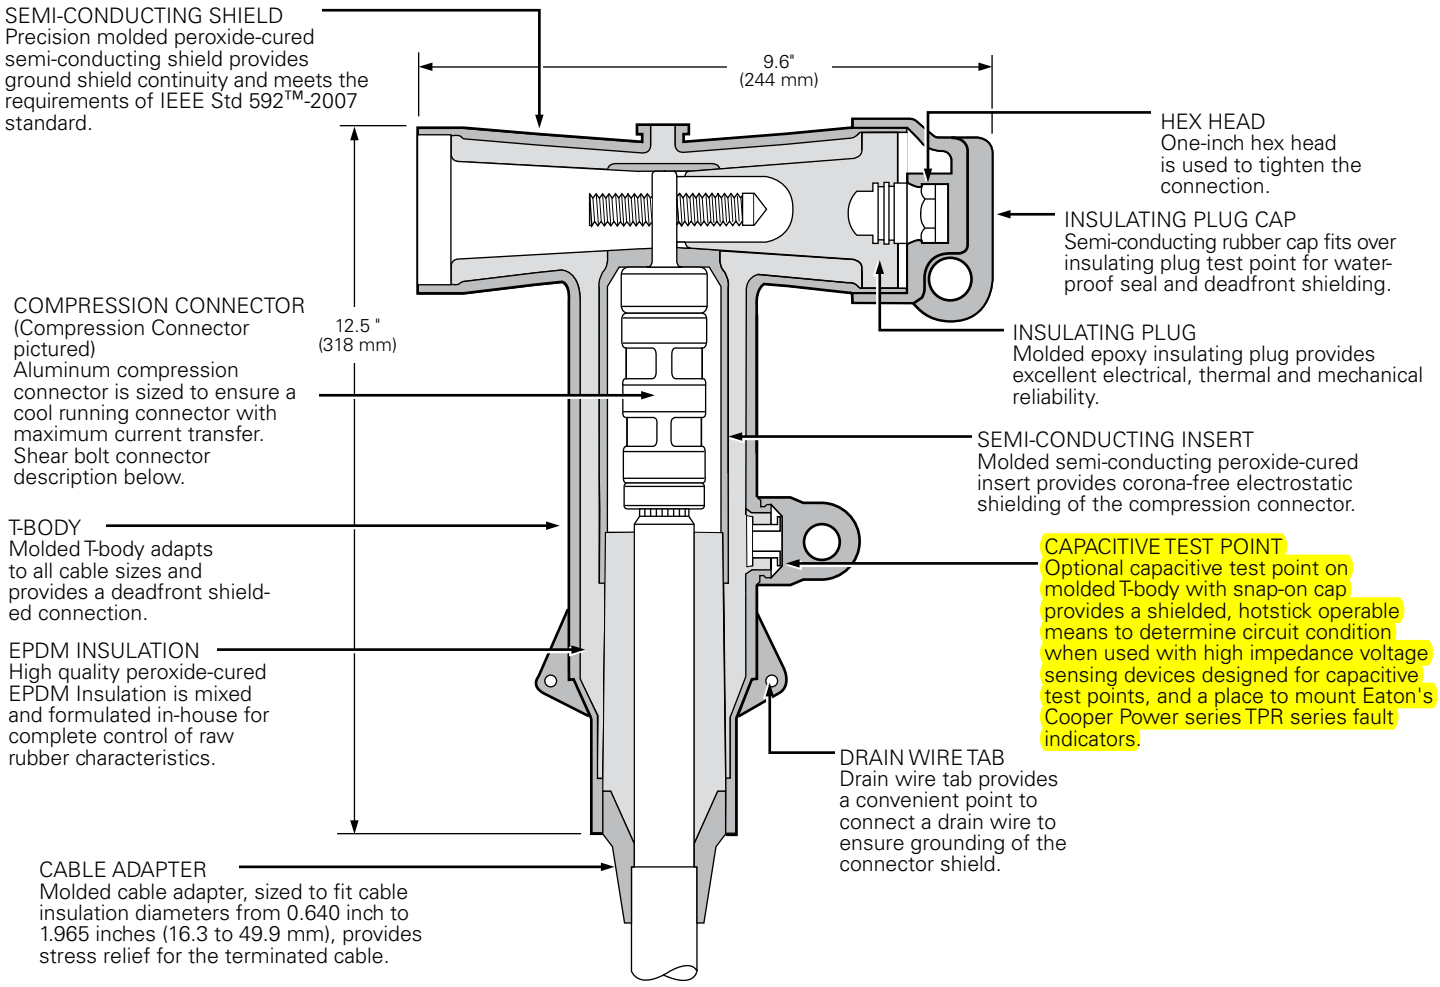

Figure 1. BOL-T Cutaway illustrates design features.

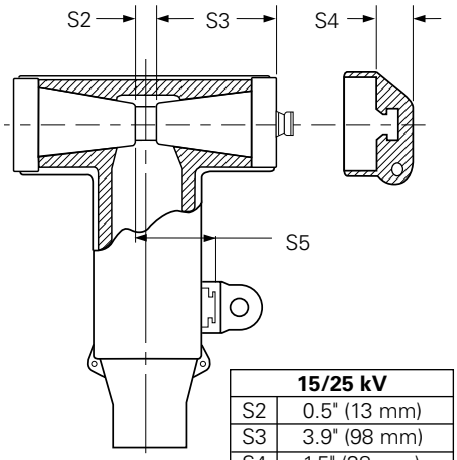
Note: Dimensions given are for reference only.

Optional features

Coppertop compression connectors

Coppertop compression connectors (aluminum sleeve welded to a copper spade) provide a high conductivity material in a bolted connection and are compatible with aluminum or copper conductors.

All copper current path



Full copper current carrying path and 900 A rating can be obtained by specifying a coppertop compression connector, copper stud and copper insulating plug.

Shear bolt connector (optional)

Bolted cable lug is fitted with stepless bolts, which shear off when optimum contact force has been reached. Provides electrical continuity for copper and aluminum conductors while eliminating need for dies and compression tools.

Figure 2. Shear bolt connector.

15/25 kV

S3	3.9" (98 mm)
S4	1.5" (38 mm)
S5	2.4" (61 mm)

Figure 3. BOL-T stacking dimensions.

Ordering information

Each BOL-T Connector Kit contains:

- Molded Rubber T-body
- Insulating Plug
- Insulating Plug Cap
- Compression or Shear Bolt Connector
- Cable Adapter
- Silicone Lubricant
- Installation Instruction Sheet

To order a 15/25 kV Class BOL-T Connector Kit, see following Steps 1-5 to build the catalog number.

BOL-T connector kit – catalog numbering system

Build the 12 digit catalog number for a BOL-T Kit by following the steps given below. The first 5 digits are "BT625", so only digits 6 through 12 need to be selected.

1	2	3	4	5	6	7	8	9	10	11	12
B	T	6	2	5							

Catalog number digits:

1 & 2 = "BT", BOL-T Connector System

3 = "6", 600 A System

4 & 5 = "25", 25 kV Class Bushing Interface

Step 1 – Select digits 6 and 7 cable adapter range code

Determine the cable's diameter over the electrical insulation as shown in Figure 4 (including tolerances).

Then identify a cable range from Table 3 that covers the minimum and maximum insulation diameters.

Select the correct CABLE RANGE CODE from Table 3.

Table 3. Cable Diameter Range

Cable Diameter Range

Inches	mm	Code
0.610-0.970	15.5-24.6	**AB**
0.750-1.080	19.1-27.4	**CC**
0.970-1.310	24.6-33.3	**DD**
1.090-1.470	27.7-37.3	**EE**
1.260-1.640	32.0-41.7	**FF**
1.360-1.710	34.5-43.4	**GG**
1.510-1.850	38.4-47.0	**HH**
1.700-1.970	43.2-50.0	**JJ**

Step 2 – Select digits 8 and 9 conductor code

Identify the conductor size and type in Table 4 and select the CONDUCTOR CODE from the appropriate (compression or shear bolt) column.

Step 3 – Select digit 10

Determine whether Aluminum or Copper is required for the compression connector, stud, and deadbreak insulating plug. Shear bolt connector is only available as a 600 A aluminum connector.

"A" = Aluminum (Shear Bolt or Compression Connector)

"C" = Copper (Coppertop for the connector) **Required to achieve 900 A rating, compression connector only.**

Step 4 – Select digit 11

Determine if a stud should be included in the kit.

"1" = Stud Included

"2" = Stud Not Included

Step 5 – Select digit 12

Determine if the T-body should have a test point.

T = Test Point on T-body

If no test point is required, do not include an 12th digit.

EXAMPLE: Select a BOL-T Kit for 250 kcmil compressed cable with a nominal insulation diameter of 1.160" ± 0.030". The kit should have aluminum current-carrying parts and should have a stud included. The T- Body should have a test point.

Step 1 – Select digits 6 and 7

Nominal diameter over insulation is 1.160" ± 0.030".

Minimum diameter = 1.160" - 0.030" = 1.130".

Maximum diameter = 1.160" + 0.030" = 1.190".

From Table 3, identify the cable range that covers 1.130" - 1.190" and select the "EE" cable range code.

Step 2 – Select digits 8 and 9

The conductor size is 250 kcmil compressed. From Table 4, under the column "Concentric or Compressed," identify 250 kcmil and select the "17" conductor code.

Step 3 – Select digit 10

The kit should have aluminum current-carrying parts. Select an "A" for digit 10.

Step 4 – Select digit 11

The kit should include a stud, so select 1 for digit 11.

Step 5 – Select digit 12

A test point is needed, so use a "T" for digit 12.

The complete catalog number is:

BT625EE17A1T

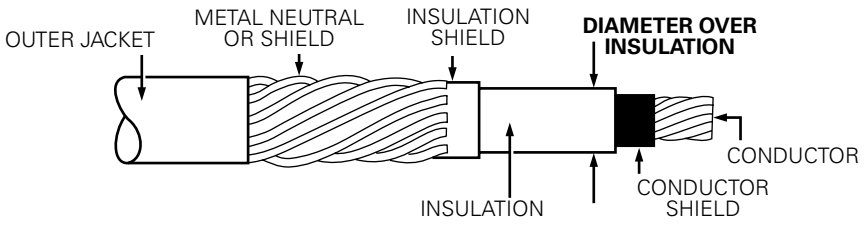

Figure 4. Illustration showing typical construction of medium voltage underground cable.

Shield Adapter Kit

SA Series Cold Shrinkable Metallic Shield Adapter Kit

The SA Series Cold Shrinkable Metallic Shield Adapter Kits make it simple and easy to seal and ground metallic shielded cable when terminating 200 A loadbreak and deadbreak elbows, 600 A deadbreak T-connectors, and splices. The SA Series Shield Adapters can be installed on tape shield, drain wire or UniShield® cables.

Sealing and grounding metallic shielded cable is simple and easy

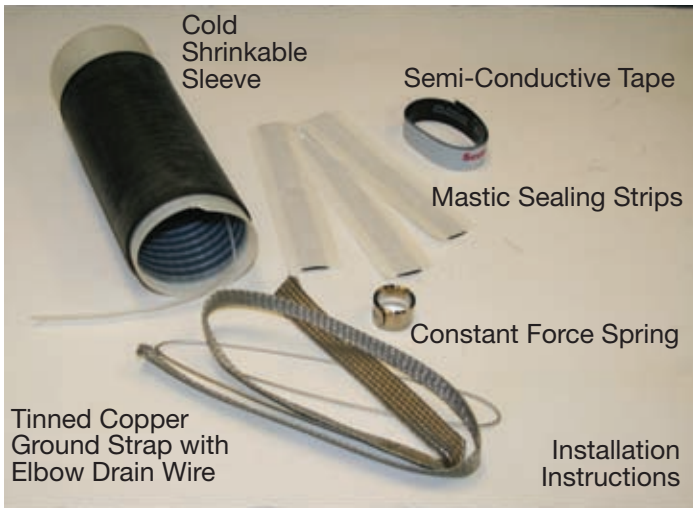
Features:

Wide Range Taking. The cold shrinkable metallic shield adapter allows the customer to cover a wide cable range, using only four shield adapter part numbers.

Easy Installation. The cold shrinkable metallic shield adapters offer a number of installation benefits:

- Minimal installation force required
- No special tools, soldering or open flame required
- No additional cable stripping (uses standard stripbacks)
- No handling sharp copper leaves or crimping operations
- No cumbersome coiled spring to break or misplace
- No messy grease
- Elbow drain wire built into the flexible ground strap

Stocking flexibility. The cold shrinkable metallic shield adapter allows distributors and customers to reduce the number of stocking kits. The same kit can ground and seal tape shield, drain wire or UniShield® cable.



Shield Adapter Kit Catalog Number	Cable Jacket OD (Inches)
SA1	0.590 - 1.050
SA2	0.830 - 1.640
SA3	1.270 - 2.170
SA4	1.600 - 2.600

How to Order:

The SA Series Cold Shrinkable Metallic Shield Adapter Kits are sized using the cable jacket outside diameter (OD). Refer to Table below.

Note: To include the SA series Cold Shrinkable metallic Shield Adapters with any Cooper Power Systems termination kit, (Elbow, T-body or Splice): Add appropriate Suffix “SA1”, “SA2”, “SA3” or “SA4” to the end of the termination catalog number.

Each kit contains:

Cooper Power Systems

Cold Shrink

QT-III Indoor and Outdoor Terminations

3M™ Cold Shrink Silicone Rubber QT-III terminations are designed for faster installation and higher reliability.

Cold Shrink QT-III Indoor Termination 1

Cold Shrink QT-III Outdoor Termination 2

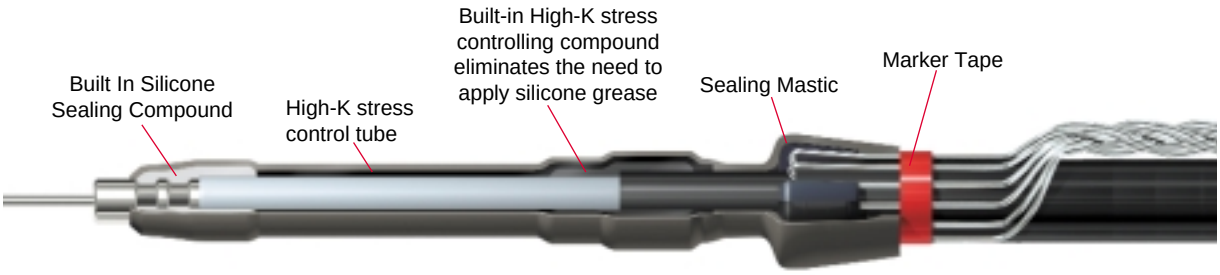
3M Cold Shrink QT-III terminations offer easy installation and reliable performance when terminating indoor and outdoor medium voltage cable. The built-in Hi-K stress controlling compound along with the built in sealing compound means simpler installation on all types of cables. These factory applied compounds make field installation easier and reduce installation errors. Plus its high-K stress design delivers excellent BIL performance and lower surface stress resulting in a more compact termination. Through superior engineering, 3M Cold Shrink QT-III terminations deliver maximum performance.

QT-III Inverted applications

Terminations that are inverted inside of equipment (switchgear, transformers, etc.) can be made using the QT-III indoor tubular design. However, for outdoor applications skirted terminations are recommended. The standard skirts of most terminations are oriented to shed water when installed in the upright direction. The skirts could collect moisture and contamination when inverted. This could lead to tracking problems. 3M has designed the 7600-S-INV series inverted kits to eliminate this problem. These inverted kits are recommended for all outdoor inverted applications.

Cold Shrink technology; over 30 years of field-proven reliability

Over thirty years ago, 3M pioneered Cold Shrink technology. Since then, field use and laboratory analysis have repeatedly proven its merits and reliability. Through constant innovation, we have refined Cold Shrink products making them better than ever. They're easier to apply and built to withstand even the most punishing environmental conditions. Enhanced performance at a lower installed cost continue to make 3M the preferred choice for Cold Shrink solutions.



QT-III Termination Features

Improved long term reliability
- Hydrophobic silicone body
- Superior track and erosion resistance
- Optimum high-K stress control
- Built-in sealing and stress controlling compounds
- Outstanding UV stability
- Designed to meet IEEE 48, CENELEC 0278 and IEC 502 standards
- Easier installation
- Installation requires no silicone tape or grease
- Shorter installed length

Cold Shrink Benefits

Lower Installed Cost
- Minimal training required
- All materials included in the kit
- Easy cable preparation
- Compact to fit into smaller equipment

High Reliability
- No heat, flames or special tools needed
- Simple, straight forward installation
- Built-in stress relief
- 30 years of proven field experience

Loadbreak Apparatus Connectors

COOPER Power Systems

COOPER Power Systems - 200A 15kV #2 Loadbreak Elbow Kit with Test Point & Shield Adapter Kit (Complete Kit for Shielded Cable)

200 A 15 kV Class Loadbreak Elbow Connector with Optional Integral Jacket Seal

500-10-7

GENERAL

The Cooper Power Systems Loadbreak Elbow Connector is a fully-shielded and insulated plug-in termination for connecting underground cable to transformers, switching cabinets and junctions equipped with loadbreak bushings. The elbow connector and bushing insert comprise the essential components of all loadbreak connections. The Cooper Elbow Connector is a fully rated 200 A switching device, designed in accordance to IEEE Std 386™ standard - latest revision.

Cooper Loadbreak Elbows are molded using high quality peroxide-cured insulating and semi-conducting EPDM rubber. Standard features include a coppertop connector, tin-plated copper loadbreak probe with an ablative arc-follower tip and stainless steel reinforced pulling-eye. An optional capacitive test point, made of corrosion resistant plastic, is available for use with fault indicators (see Catalog Section 320-40 and 320-42).

Cable ranges are designed to accept a wide range of cable conductor and insulation sizes with just three elbows and accommodate cable manufactured to either **AEIC** or **ICEA** standards.

The coppertop compression connector is a standard item to transition from the cable to the loadbreak probe. An aluminum crimp barrel is inertia-welded to a copper lug. The aluminum barrel makes the connector easy to crimp and the copper lug ensures a reliable, tight, cool operating connection with the loadbreak probe.

OPTIONAL INTEGRAL JACKET SEAL

The optional integral jacket seal provides a quick and easy means to sealing the cable jacket to prevent moisture ingress. Our jacket seal is molded to the loadbreak elbow eliminating the need for separate cable sealing products. It's available with braided ground strap/ bleeder wire for terminating Tape shielded cable. (See Figure 5.)

Figure 1

Figure 1A

S Dim.	15 kV
S3	3.4” (86 mm)
S4	4.2” (106 mm)
S5	2.7” (68 mm)
S6	1.2” (30 mm)

NOTE: Dimensions given are for reference only.

Figure 3.
Elbow profile and stacking dimensions as referenced in IEEE Std 386™ standard.

INSTALLATION

Cable stripping and scoring tools, available from various tool manufacturers, are recommended for use when installing loadbreak elbows. After preparing the cable, the elbow housing is pushed onto the cable. The loadbreak probe is threaded into the coppertop connector using the supplied installation tool or an approved equivalent. Use a shotgun stick to perform loadmake and loadbreak operations. Refer to Installation Sheet S500-10-7 for details.

PRODUCTION TESTS

Tests conducted in accordance with IEEE Std 386™ standard:
- AC 60 Hz 1 Minute Withstand — 34 kV
- Minimum Corona Voltage Level — 11 kV
- Test Point Voltage Test

Tests conducted in accordance with Cooper Power Systems requirements:
- Physical Inspection
- Periodic Dissection
- Periodic X-ray Analysis

TABLE 1
Voltage Ratings and Characteristics

Description	kV
Standard Voltage Class	15
Maximum Rating Phase-to-Phase	14.4
Maximum Rating Phase-to-Ground	8.3
AC 60 Hz 1 Minute Withstand	34
DC 15 Minute Withstand	53
BIL and Full Wave Crest	95
Minimum Corona Voltage Level	11

Voltage ratings and characteristics are in accordance with IEEE Std 386™ standard.

TABLE 2
Current Ratings and Characteristics

Description	Amperes
Continuous	200 A rms
Switching	10 operations at 200 A rms at 14.4 kV
Fault Closure	10,000 A rms symmetrical at 14.4 kV for 0.17 s after 10 switching operations
Short Time	10,000 A rms symmetrical for 0.17 s
	3,500 A rms symmetrical for 3.0 s

Current ratings and characteristics are in accordance with IEEE Std 386™ standard.

ORDERING INFORMATION

The Elbow kits are packaged in a heavy duty polyethylene bag. There are 20 bagged kits to a carton. Individual boxed kits are also available by special part number. To order a 15 kV Class Loadbreak Elbow Kit follow the easy steps below.

Each kit contains:

- Standard Elbow Body or Elbow Body with Jacket Seal
- Coppertop Compression Connector
- Loadbreak Probe
- Probe Installation Tool
- Silicone Lubricant
- Mastic Strips (**Jacket Seal Elbow Only**)
- Installation Instruction Sheet

STEP 1: Determine the cable's diameter over the electrical insulation as shown in Figure 4 (including tolerances) from cable manufacturer. Then identify a cable range from Table 3 that brackets the minimum and maximum insulation diameters. Select the CABLE RANGE CODE from the far right column.

STEP 2: Identify the conductor size and type in Table 4 and select the CONDUCTOR CODE from the far right column.

STEP 3: For an elbow kit with a capacitive test point order:

LE215	CABLE RANGE CODE	CONDUCTOR CODE	T

For an integral jacket seal elbow kit with a capacitive test point order:

LEJ215	CABLE RANGE CODE	CONDUCTOR CODE	T

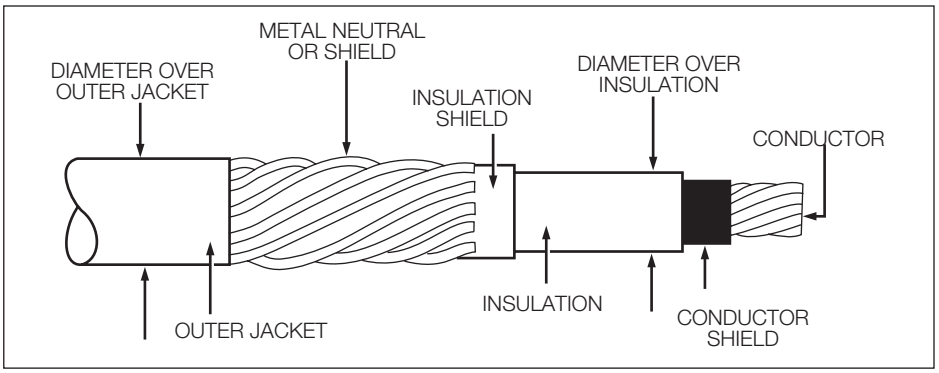

Figure 4.
Illustration showing typical construction of high voltage underground cable.

For an elbow kit without a capacitive test point order:

LE215	CABLE RANGE CODE	CONDUCTOR CODE

For an integral jacket seal elbow kit without a capacitive test point order:

LEJ215	CABLE RANGE CODE	CONDUCTOR CODE

For an elbow kit without a compression connector, use "**00**" for the conductor code.

For an elbow kit with a hold down bail assembly included, insert a "**B**" after the test point option code.

STEP 4: For optional braided ground strap/bleeder wire for terminating tape shielded cable, insert "**GS**" after test point and/or bail option code. (**Integral Jacket Seal Elbow Only**)

STEP 5: (Optional) For an elbow kit individually packaged in a corrugated cardboard box, insert an "**X**" as the last character in the part number.

Table 3
Cable Range for Loadbreak Elbow

Inches	Millimeters	Cable Range Code
0.495" - 0.585"	12.6 - 14.9	CCA*
0.575" - 0.685"	14.6 - 17.4	CCB*
0.610" - 0.970"	15.5 - 24.6	AB
0.750" - 1.080"	19.1 - 27.4	CC
0.890" - 1.220"	22.6 - 30.0	DD

* Uses 5 kV cable adapter.
(For use with "CC" range elbow only.)

TABLE 4
Conductor Size and Type

Class B Stranded or Compressed		Compact or Solid		CONDUCTOR CODE
AWG	mm^2	AWG	mm^2	
No Connector				**00**
#6	16	#4	—	**01**
#4	—	#3	25	**02**
#3	25	#2	35	**03**
#2	35	#1	—	**04**
#1	—	1/0	50	**05**
1/0	50	2/0	70	**06**
2/0	70	3/0	—	**07**
3/0	—	4/0	95	**08**
4/0	95	250	120	**09**
250*	120	300	—	**10**

*Compressed stranding only.

EXAMPLE: Select an integral jacket seal elbow kit with a capacitive test point for use on a #1 compact cable with a minimum insulation diameter of 0.770" and a maximum diameter of 0.830".

STEP 1: From Table 3, identify the cable range 0.610"—0.970" and select the "**AB**" CABLE RANGE CODE.

STEP 2: The conductor size is a #1 and the type is compact.

From Table 4, under the column "Compact or Solid" identify #1 and select the "**04**" conductor code.

STEP 3: Order catalog number.

LEJ215AB04T

TABLE 5
Replacement 2.88" Long Coppertop Connectors

Shield Adapter Kit

SA Series Cold Shrinkable Metallic Shield Adapter Kit

The SA Series Cold Shrinkable Metallic Shield Adapter Kits make it simple and easy to seal and ground metallic shielded cable when terminating 200 A loadbreak and deadbreak elbows, 600 A deadbreak T-connectors, and splices. The SA Series Shield Adapters can be installed on tape shield, drain wire or UniShield® cables.

Sealing and grounding metallic shielded cable is simple and easy

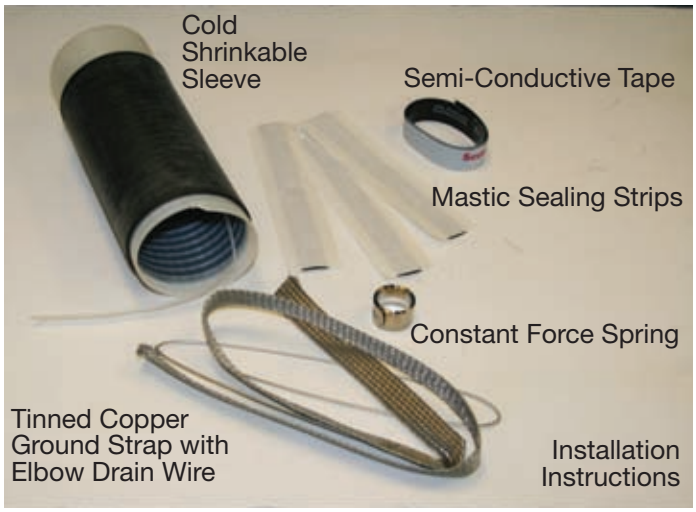
Features:

Wide Range Taking. The cold shrinkable metallic shield adapter allows the customer to cover a wide cable range, using only four shield adapter part numbers.

Easy Installation. The cold shrinkable metallic shield adapters offer a number of installation benefits:

- Minimal installation force required
- No special tools, soldering or open flame required
- No additional cable stripping (uses standard stripbacks)
- No handling sharp copper leaves or crimping operations
- No cumbersome coiled spring to break or misplace
- No messy grease
- Elbow drain wire built into the flexible ground strap

Stocking flexibility. The cold shrinkable metallic shield adapter allows distributors and customers to reduce the number of stocking kits. The same kit can ground and seal tape shield, drain wire or UniShield® cable.



Shield Adapter Kit Catalog Number	Cable Jacket OD (Inches)
SA1	0.590 - 1.050
SA2	0.830 - 1.640
SA3	1.270 - 2.170
SA4	1.600 - 2.600

How to Order:

The SA Series Cold Shrinkable Metallic Shield Adapter Kits are sized using the cable jacket outside diameter (OD). Refer to Table below.

Note: To include the SA series Cold Shrinkable metallic Shield Adapters with any Cooper Power Systems termination kit, (Elbow, T-body or Splice): Add appropriate Suffix “SA1”, “SA2”, “SA3” or “SA4” to the end of the termination catalog number.

Each kit contains:

General Specification

Brand Name	SIEMENS
Type	ENCLOSED/SAFETY SWITCH
Standard	UL
Voltage Rating	600V
Amperage Rating	200A
Wattage	4W

Technical Specification

Number Of Poles	3P
Frequency Rating	60Hz
Action	SINGLE THROW
Material	304SS
Enclosure	TYPE 3R
Mounting	2 OR 3 POINT MOUNTING HOLES
Insulation	NO
Operating Cycles	8000
Operating Temperature	(-20F-120F) AMBIENT TEMPERATURE
Environmental Conditions	OUTDOOR

Heavy Duty Safety Switch

Type VBII, 200 Amp, Type 3R (Outdoor)

Standards and Ratings
- UL Listed under file #E4776
- Meets UL98 for switches and UL 50 for enclosures
- Meets NEMA Standard KS-1 for enclosed switches
- Meets NEC wire bending space requirements
- Rated 10,000 AIC with Class H fuses or 200,000 AIC with Class R, T and J fuses
- Rated 100,000 AIC at 600Vdc with Class R or J fuses
- I^2t rated (Amps^2 x Seconds = 2,000,000)
- 12X overload current rating exceeds 10X industry standard
- Suitable for use as service entrance equipment

Features
- Quick-make and break switching action
- Double break visible blade design
- Highly visible ON/OFF indication
- Rugged installer friendly enclosure design
- Modular design allows quick and easy replacement of parts
- Front removable lugs which can easily be converted to copper body or compression type lugs
- Defeatable dual cover interlock

TPS3 12 and TPS3 L12 (True or Discrete 10-Mode)

TPS3 12 and TPS3 L12 are UL 1449-4 Type 2 and Optional UL 1449 4th Edition surge protective device with a per phase surge current capacity that can be increased to 500 kA (TPS3 L12 up to 450 kA). For mission critical or high profile applications, the TPS3 L12 is our "True" or "Discrete" 10-mode style SPD providing the "Just in Case" assurance of directly connected L-L MOVs.

Both TPS3 12 and TPS3 L12 are UL 1283 Listed incorporating EMI/RFI or Sine Wave tracking filtering designed to condition low energy L-N coupled noise. When installed at the electrical service entrance, it can be used for UL 96A compliance (@ 20 kA In).

Standard monitoring includes protection status indication LEDs, audible alarm, and dry contacts. Complete protection is intact when the status indicators are illuminated. When protection is lost, the status indicator will extinguish, the red service light will illuminate, and the dry contacts will change state. An optional surge counter is available.

A new diagnostic feature integrated within the TPS3 12 and TPS3 L12 is Ground Integrity Monitoring or (GIM) diagnostic indication circuit. Ground Integrity Monitoring or (GIM) diagnostics monitors the health of the electrical system's neutral to ground bond. If voltage is seen across neutral and ground, the phase indicators will remain illuminated, while the red service light begins to flash alerting the end user that the electrical system grounding needs to be checked and serviced. This feature can be remotely monitored via the dry contact outputs. Siemens TPS3s are one of the first in the industry to offer this power quality safety and performance indication.

TPS3 12 and TPS3 L12 Key Features

- UL 1449-4 Type 2 SPD and UL 1283 Listed
  - Optional UL 1449 4th Edition Listed Type 1
- Type 1 / Type 2 SPD
- TPS3 12: 100 – 500 kA Per Phase Surge Current
- TPS3 L12: 150, 300, 450 kA Phase Surge Current
- 20 kA I_n (Most models)
- 200 kA SCCR (Most models)
- UL 96A Lightning Protection Master Labeling compliant (@ 20 kA)
- Every MOV is monitored, including N-G
- Mounts external to electrical distribution equipment
  - Recommended for line side or load side applications
- Standard NEMA 1/12/3R/04 ANSI 61 steel enclosure
- TPS3 12 Modes of Protection – L-N, L-G, N-G, and L-L
- TPS3 L12 Modes of Protection – L-N, L-G, N-G, and L-L (directly connected L-L elements)
- Standard Monitoring:
  - LED Indicators
  - Ground Integrity Monitoring diagnostics
  - Dry Contacts
  - Audible alarm with silence switch and test button
- Wire size: #8 AWG to 1/0
- Dimensions: 12" x 12" x 7" (305 mm x 305 mm x 178 mm)③
- Weight: 20 lb. (9.07 kg)③
- 10 Year Product Warranty

Available Options:

- Internal rotary disconnect
- Thru-door disconnect

TPS3 12

Ordering Information

Catalog # TPS3 ☐ 12 ☐☐ ☐ ☐☐☐

Voltage Code

A = 120/240 V, 1Ø, 3W
B = 120/240 V, 3Ø, 4W
C = 120/208 V, 3Ø, 4W
D = 240 V, 3Ø, 3W①
E = 277/480 V, 3Ø, 4W
F = 480 V, 3Ø, 3W①
G = 600 V, 3Ø, 3W②
K = 380/220 V, 3Ø, 4W
L = 600/347 V, 3Ø, 4W
S = 400/230 V, 3Ø, 4W

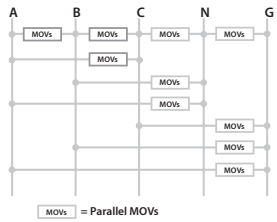
Surge Current (kA)

10 = 100 kA per phase
15 = 150 kA per phase
20 = 200 kA per phase
25 = 250 kA per phase
30 = 300 kA per phase
40 = 400 kA per phase
50 = 500 kA per phase

Enclosure

0 = Standard NEMA 1/12/3R/4 Steel
V = NEMA 4X non-metallic
S = NEMA 4X stainless steel
F = NEMA 1 flush mount
P = NEMA 1 screwcover pullbox with extended display on 6ft cable for line side mounting in SWBD/SWGR

Options



2 = Type 2 SPD (Default) Includes UL 1283 EMI/RFI Filters
0 = Type 1 SD (Consult Factory Prior to Ordering)
D = Internal rotary disconnect
T = Thru-door disconnect
X = Surge Counter (Standard)

Example: **TPS3C12100XD2** = Type 2 SPD (Default) for a 208/120V application with a surge current capacity of 100kA per phase, in a standard NEMA 1/12/3R/4 enclosure with a surge counter and internal rotary disconnect option.

When option **X**, **T**, or **D** are NOT selected, include a **zero** (**0**) in the field.

Available Accessories: Ordered Separately

RMSIE = Remote monitor
① Not available in 500 kA
② Available in 100 kA, 150 kA, 200 kA & 250 kA only

"True" or "Discrete" 10-Mode SPD

0 = Type 1 SD (Consult Factory Prior to Ordering)
D = Internal rotary disconnect
T = Thru-door disconnect
X = Surge Counter (Standard)

Example: **TPS3CL12150XD2** = 10 Mode, Type 2 SPD (Default) for a 208/120V application with a surge current capacity of 150kA per phase, in a standard NEMA 1/12/3R/4 enclosure with a surge counter and internal rotary disconnect option.

When an option is NOT selected, include a **zero** (**0**) in the field.

Available Accessories: Ordered Separately

RMSIE = Remote monitor

③ Internal disconnect options and other NEMA ratings may increase enclosure size and weight

JUNCTION BOX

Panel Enclosures
Type 3R Large Continuous Hinge Cover
Data Sheet and Catalog Number

Application
- Used as wiring boxes, junction and pull boxes
- Protects against falling rain, sleet and external ice formation

Standards
- UL 50 listed, Type 3R
- CSA C22.2 No. 40 certified, Type 3R
- Conforms to NEMA standard for Type 3R

Construction
- Enclosure and door are fabricated from code gauge galvaneal steel, (see below)
- Enclosure standard without knockouts
- Door is secured to the body with a continuous hinge and stainless steel pin on one side and captive screws on the opposite side
- Door has padlock hasp with sealing hole provision
- .375-16 collar studs are furnished for mounting optional panel
- External mounting feet are provided for secure wall mounting
- Ground stud provided on door

Finish
- Wash and phosphate undercoat
- ANSI 61 gray polyester powder finish

Accessories
- Panels
- Touch-up paint
- See Accessories section

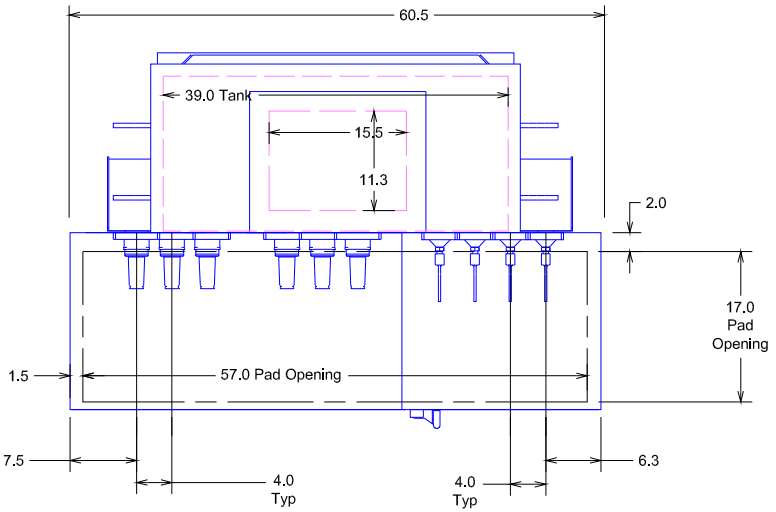
The Action Designated Above is in Accordance with the Following Legend:

A – Furnish as Submitted
B – Furnish as Noted
C – Revise and Re-submit
1. Not enough information for review.
2. No reproducible submitted.
3. Copies illegible.
4. Not enough copies submitted.
5. Wrong sequence number.
6. Wrong resubmittal number.
7. Wrong Spec. Section.
8. Wrong form used.
9. See Comments.

D – Rejected
E – Engineer's Review not Required
1. Submittal not required.
2. Supplemental Information. Submittal retained for Information purposes only.
3. Information reviewed and approved on prior submittal.
4. See Comments.

Review is for general compliance with Contract Documents. No responsibility is assumed for correctness of dimensions or detail. Contractor is required to specify deviations from contract requirements. Lack of exceptions noted by Engineer does not waive Contractor's obligation to comply with Drawings and Specifications.



Comments:
Items reviewed and confirmed to meet requirements
(Reviewed Material in Parentheses)

Three-phase pad-mounted compartmental type transformer

General

At Eaton, we are constantly striving to introduce new innovations to the transformer industry, bringing you the highest quality, most reliable transformers. Eaton's Cooper Power series Transformer Products are ISO 9001 compliant, emphasizing process improvement in all phases of design, manufacture, and testing. In order to drive this innovation, we have invested both time and money in the Thomas A. Edison Technical Center, our premier research facility in Franksville, Wisconsin. Such revolutionary products as distribution-class UltraSIL™ Polymer-Housed Evolution™ surge arresters and Envirotemp™ FR3™ fluid have been developed at our Franksville lab.

With transformer sizes ranging from 45 kVA to 12 MVA and high voltages ranging from 2400 V to 46 kV, Eaton has you covered. From fabrication of the tanks and cabinets to winding of the cores and coils, to production of arresters, switches, tap changers, expulsion fuses, current limit fuses, bushings (live and dead) and molded rubber goods, Eaton does it all. Eaton's Cooper Power series transformers are available with electrical grade mineral oil or Envirotemp™ FR3™ fluid, a less-flammable and bio-degradable fluid. Electrical codes recognize the advantages of using Envirotemp™ FR3™ fluid both indoors and outdoors for fire sensitive applications. The bio-based fluid meets Occupational Safety and Health Administration (OSHA) and Section 450.23 NEC Requirements.

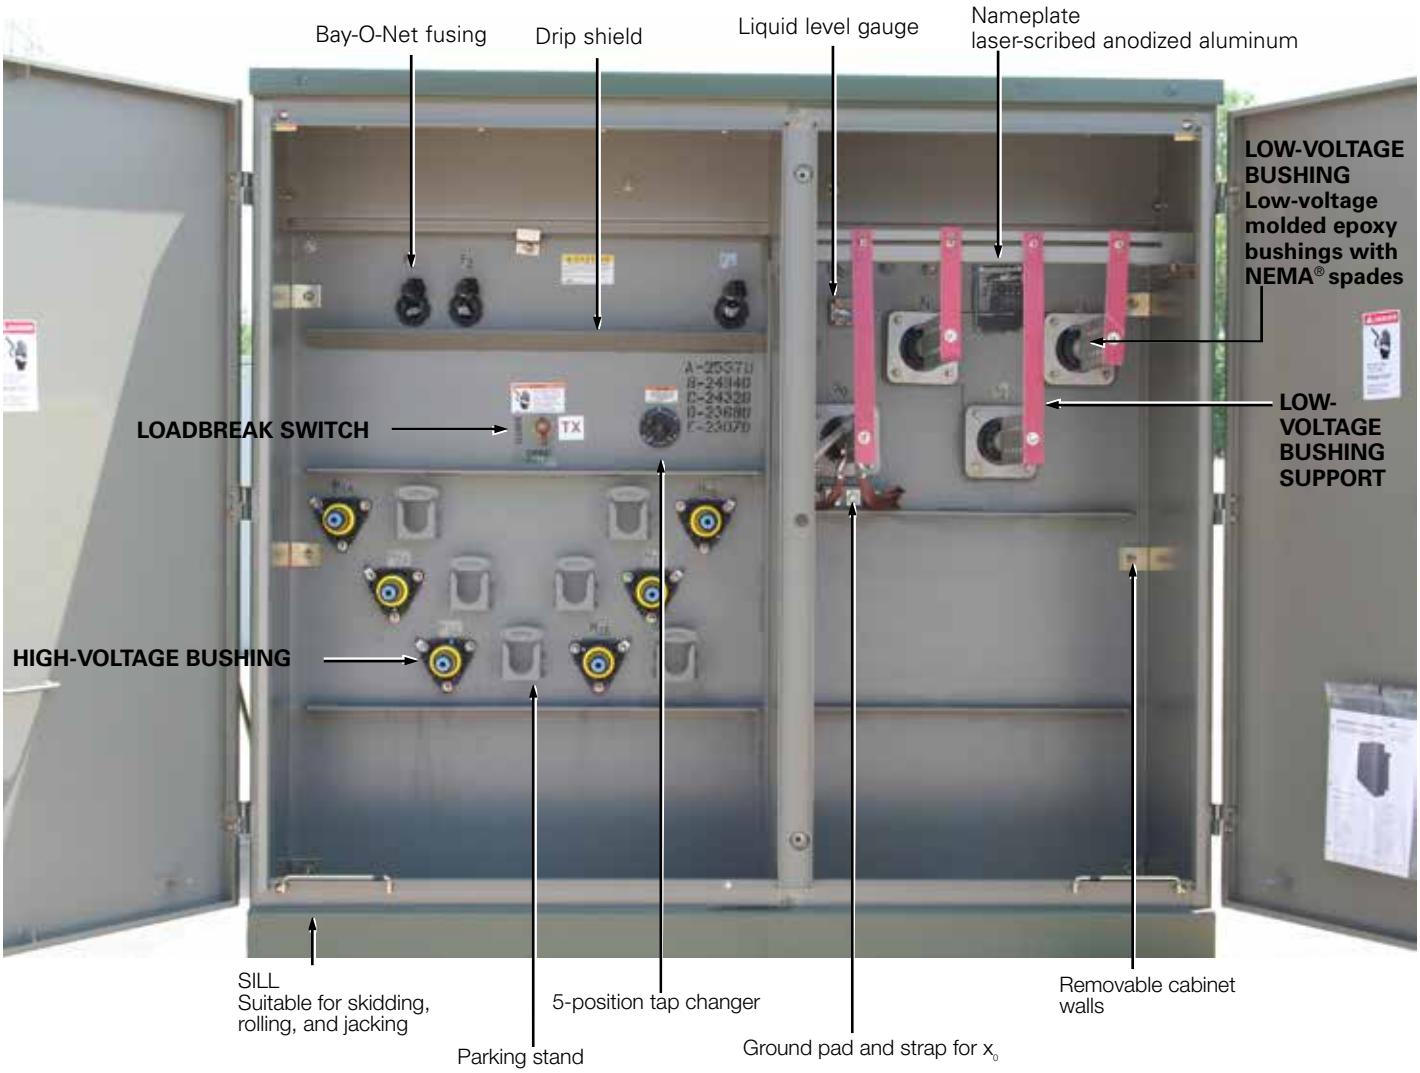

Figure 1. Three-phase pad-mounted compartmental type transformer.

Table 1. Product Scope

Type	Three Phase, 50 or 60 Hz, 65 °C Rise (55 °C, 55/65 °C), 65/75 °C, 75 °C
Fluid Type	Mineral oil or Envirotemp™ FR3™ fluid
Coil Configuration	2-winding or 4-winding or 3-winding (Low-High-Low), 3-winding (Low-Low-High)
Size	45 – 10,000 kVA
Primary Voltage	2,400 – 46,000 V
Secondary Voltage	208Y/120 V to 14,400 V
Specialty Designs	Inverter/Rectifier Bridge
	K-Factor (up to K-19)
	Vacuum Fault Interrupter (VFI)
	UL® Listed & Labeled and Classified
	Factory Mutual (FM) Approved®
	Solar/Wind Designs
	Differential Protection
	Seismic Applications (including OSHPD)
	Hardened Data Center

Table 2. Three-Phase Ratings

Standard features

Connections and neutral configurations

- Delta - Wye: Low voltage neutral shall be a fully insulated X0 bushing with removable ground strap.
- Grounded Wye-Wye: High voltage neutral shall be internally tied to the low voltage neutral and brought out as the H0X0 bushing in the secondary compartment with a removable ground strap.
- Delta-Delta: Transformer shall be provided without a neutral bushing.
- Wye-Wye: High voltage neutral shall be brought out as the H0 bushing in the primary compartment and the low voltage neutral shall be brought as the X0- bushing in the secondary compartment.
- Wye-Delta: High voltage neutral shall be brought out as the H0 bushing in the primary compartment. No ground strap shall be provided (line to line rated fusing is required).

High and low voltage bushings

- 200 A bushing wells (15, 25, and 35 kV)
- 200 A, 35 kV Large Interface
- 600 A (15, 25, and 35 kV) Integral bushings (dead-front)
- Electrical-grade wet-process porcelain bushings (live-front)

Tank/cabinet features

- Bolted cover for tank access (45-2500 kVA)
- Welded cover with hand hole (>2500 kVA)
- Three-point latching door for security
- Removable sill for easy installation
- Lifting lugs (4)
- Stainless steel cabinet hinges and mounting studs
- Steel divider between HV and LV compartment
- 20" Deep cabinet (45-1000 kVA)
- 24" Deep cabinet (1500-7500 kVA)
- 30" Deep cabinet (34.5/19.92 kV)
- Pentahead captive bolt
- Stainless steel 1-hole ground pads (45-500 kVA)
- Stainless steel 2-hole ground pads (750-10,000 kVA)
- Parking Stands (dead-front)

Valves/plugs

- One-inch upper filling plug
- One-inch drain plug (45-500 kVA)
- One-inch combination drain valve with sampling device in low voltage compartment (750-10,000 kVA)
- Automatic pressure relief valve

Nameplate

- Laser-scribed anodized aluminum nameplate

Figure 3. Drain valve with sampler.

Figure 4. Automatic Pressure relief valve.

Figure 5. Liquid level gauge.

Figure 6. External Gauges.

Figure 7. External visible break with gauges.

Optional features

High and low voltage bushings

- 200 A (15, 25 kV) bushing inserts
- 200 A (15, 25 kV) feed thru inserts
- 200 A (15, 25 kV) (HTN) bushing wells with removable studs
- High-voltage 600 A (15, 25, 35 kV) deadbreak one-piece bushings
- Low voltage 6-, 8-holes spade
- Low voltage 12-, 16-, 20-holes spade (750-2500 kVA)
- Low voltage bushing supports

Tank/cabinet features

- Stainless steel tank base and cabinet
- Stainless steel tank base, cabinet sides and sill
- 100% stainless steel unit
- Service entrance (2 inch) in sill or cabinet side
- Touch-up paint (domestic)
- Copper ground bus bar
- Kirk-Key provisions
- Nitrogen blanket
- Bus duct cutout

Special designs

- Factory Mutual (FM)
- UL® Classified
- Triplex
- High altitude
- K-Factors
- Step-up
- Critical application
- Modulation transformers
- Seismic applications (including OSHPD)

Switches

- One, two, or three On/Off loadbreak switches
- 4-position loadbreak V-blade switch or T-blade switch
- Delta-wye switch
- 3-position V-Blade selector switch
- 100 A, 150 A, 300 A tap changers
- Dual voltage switch
- Visible break with VFI interrupter interlock
- External visible break (15, 25, and 35 kV, up to 3 MVA)
- External visible break with gauges (15, 25, and 35 kV, up to 3 MVA)

Gauges and devices

- Liquid level gauge (optional contacts)
- Pressure vacuum gauge (optional contacts and bleeder)
- Dial-type thermometer (optional alarm contacts)
- Cover mounted pressure relief device (optional alarm contacts)
- Ground connectors
- Hexhead captive bolt
- Molded case circuit breaker mounting provisions
- External gauges in padlockable box

Overcurrent protection

- Bay-O-Net fusing (Current sensing, dual sensing, dual element, high amperage overload)
- Bay-O-Net expulsion fuse in series with a partial range under-oil ELSP current limiting fuse (below 23 kV)
- Cartridge fusing in series with a partial range under-oil ELSP current limiting fuse (above 23 kV)
- MagneX™ interrupter with ELSP current-limiting fuse
- Vacuum Fault Interrupter (VFI)
- Visible break window
- Fuse/switch interlock

Valves/plugs

- Drain/sampling valve in high-voltage compartment
- Globe type upper fill valve

Overvoltage protection

- Distribution-, intermediate-, or station-class surge arresters
- Elbow arresters (for dead-front connections)

Metering/fan/control

- Full metering package
- Current Transformers (CTs)
- Metering Socket
- NEMA® 4 control box (optional stainless steel)
- NEMA® 7 control box (explosion proof)
- Fan Packages

Testing

- Customer test witness
- Customer final inspection
- Zero Sequence Impedance Test
- Heat Run Test
- ANSI® Impulse Test
- Audible Sound Level Test
- RIV (Corona) Test
- Dissolved Gas Analysis (DGA) Test
- 8- or 24-Hour Leak Test

Coatings (paint)

- ANSI® Bell Green
- ANSI® #61 Light Gray
- ANSI® #70 Sky Gray
- Special paint available per request

Nameplate

- Stainless steel nameplate

Decals and labels

- High voltage warning signs
- Mr. Ouch
- Bi-lingual warning
- DOE compliant
- Customer stock code
- Customer stenciling
- Shock and arc flash warning decal
- Non-PCB decal

Construction

Core

The three-legged, step-lap mitered core construction is manufactured using a high-quality cutting machine. For maximum efficiency, cores are precisely stacked, virtually eliminating gaps in the corner joints.

Five-legged wound core or shell-type triplex designs are used for wye-wye connected transformers, and other special transformer designs.

Cores are manufactured with precision cut, burr-free, grain-oriented silicon steel. Many grades of core steel are available for optimizing core loss efficiency.

Coils

Pad-mounted transformers feature a rectangular coil configuration with wire-wound, high-voltage primaries and sheet-wound secondaries. The design minimizes axial stress developed by short circuits and provides for magnetic balancing of tap connections.

Coils are wound using the highest quality winding machines providing exacting tension control and conductor placement for superior short-circuit strength and maximum efficiency.

Extra mechanical strength is provided by diamond pattern, epoxy-coated paper insulation, used throughout the coil, with additional epoxy at heavy stress points. The diamond pattern distribution of the epoxy and carefully arranged ducts, provide a network of passages through which cooling fluid can freely circulate.

Coil assemblies are heat-cured under calculated hydraulic pressure to ensure performance against short-circuit forces.

Core and coil assemblies

Pad-mounted transformer core and coil assemblies are braced with heavy steel ends to prevent the rectangular coil from distorting under short-circuit conditions. Plates are clamped in place using presses, and welded or bolted to form a solid core and coil assembly. Core and coil assemblies exceed ANSI® and IEEE® requirements for short-circuit performance. Due to the rigidity of the design, impedance shift after short-circuit is comparable to that of circular wound assemblies.

Tanks

Transformer tanks are designed for high strength and ease of handling, installation, and maintenance. Tanks are welded using precision-cut, hot rolled, pickled and oiled steel. They are sealed to protect the insulating fluid and other internal components.

Transformer tanks are pressure-tested to withstand 7 psig without permanent distortion and 15 psig without rupture.

Tank finish

An advanced multi-stage finishing process exceeds IEEE Std C57.12.28™-2014 standards. The eight-stage pre-treatment process assures coating adhesion and retards corrosion. It converts tank surfaces to a nonmetallic, water insoluble iron phosphate coating.

The paint method consists of two distinct layers of paint. The first is an epoxy primer (E-coat) layer which provides a barrier against moisture, salt and corrosives. The two-component urethane final coat seals and adds ultraviolet protection.

Vacuum processing

Transformers are dried and filled with filtered insulating fluid under vacuum, while secondary windings are energized. Coils are heated to drive out moisture, ensuring maximum penetration of fluid into the coil insulation system.

Insulating fluid

Eaton's Cooper Power series transformers are available with electrical-grade mineral insulating oil or Envirotemp™ FR3™ fluid. The highly refined fluids are tested and degassed to assure a chemically inert product with minimal acid ions. Special additives minimize oxygen absorption and inhibit oxidation. To ensure high dielectric strength, the fluid is re-tested for dryness and dielectric strength, refiltered, heated, dried, and stored under vacuum before being added to the completed transformer.

Eaton's Cooper Power series transformers filled with Envirotemp™ FR3™ fluid enjoy unique fire safety, environmental, electrical, and chemical advantages, including insulation life extending properties.

A bio-based, sustainable, natural ester dielectric coolant, Envirotemp™ FR3™ fluid quickly and thoroughly biodegrades in the environment and is non-toxic per acute aquatic and oral toxicity tests.

Building for Environmental and Economic Sustainability (BEES) total life cycle assessment software, utilized by the US Dept. of Commerce, reports its overall environmental performance impact score at 1/4th that reported for mineral oil. Envirotemp™ FR3™ fluid has also earned the EPA Environmental Technology Verification of transformer materials.

With a fire point of 360 °C, Envirotemp™ FR3™ fluid is FM Approved® and Underwriters Laboratories (UL®) Classified "Less-Flammable" per NEC® Article 450-23, fitting the definition of a Listed Product per NEC®.

Figure 8. VFI transformer with visible break.

Pad-mounted VFI transformer

Eaton's Cooper Power series VFI transformer combines a conventional distribution transformer with the proven Vacuum Fault Interrupter (VFI). This combination provides both voltage transformation and transformer over current protection in one space saving and money saving package. The pad-mounted VFI transformer protects the transformer and provides proper coordination with upstream protective devices. When a transformer fault or overload condition occurs, the VFI breaker trips and isolates the transformer.

The three-phase VFI breaker has independent single-phase initiation, but is three-phase mechanically gang-tripped. A trip signal on any phase will open all three phases. This feature eliminates single-phasing of three phase loads. It also enables the VFI breaker to be used as a three-phase load break switch.

Due to the resettable characteristics of the VFI breaker, restoring three-phase service is faster and easier.

The sealed visible break window and switch is an option that can be installed to provide visible break contact. This feature provides enhanced safety and allows an operator to see if the loadbreak switch contacts are in an open or closed position before performing maintenance.

Envirotran™ FM Approved special protection transformer

Eaton's Cooper Power series Envirotran™ transformer is FM Approved and suitable for indoor locations. Factory Mutual Research Corporation's (FMRC) approval of the Envirotran transformer line makes it easy to comply with and verify compliance with Section 450.23, 2008 NEC, Less-Flammable Liquid-Filled Transformer Requirements for both indoor and outdoor locations.

Envirotran FM Approved transformers offer the user the benefit of a transformer that can be easily specified to comply with NEC, and makes FM Safety Data Sheet compliance simpler, while also providing maximum safety and flexibility for both indoor and outdoor installations.

Because the "FM Approved" logo is readily visible on the transformer and its nameplate, NEC compliance is now easily verifiable by the inspector.

Envirotran FM Approved transformers are manufactured under strict compliance with FMRC Standard 3990 and are filled with FM Approved Envirotemp™ FR3™ fluid, a fire-resistant dielectric coolant.

FM
APPROVED

Special application transformers

Data Center transformer

With focus rapidly shifting from simply maximizing uptime and supporting demand to improving energy utilization, the data center industry is continually looking for methods to increase its energy efficiency and reliability. Utilizing cutting edge technology, Eaton's Cooper Power series Hardened Data Center (HDC) transformers are the solution. Designed with special attention given to surge protection, HDC liquid-filled transformers provide superior performance under the harshest electrical environments. Contrary to traditional dry-type units, HDC transformers provide unsurpassed reliability, overloadability, operational life, efficiency, thermal loading and installed footprint. These units have reliably served more than 100 MW of critical data center capacity for a total of more than 6,000,000 hours without any reported downtime caused by a thermal or short-circuit coil failure.

The top priority in data center operations is uninterrupted service. Envirotran HDC transformers from Eaton, having substantially higher levels of insulation, are less susceptible to voltage surges. Eaton has experienced zero failures due to switching transients. The ANSI® and IEEE® standard impulse withstand ratings are higher for liquid-filled transformers, making them less susceptible to insulation failure. The Envirotran HDC transformer provides ultimate protection by increasing the BIL rating one level higher than standard liquid-filled transformer ratings. The cooling system of liquid-filled transformers provides better protection from severe overloads—overloads that can lead to significant loss of life or failure.

Data center design typically includes multiple layers of redundancy, ensuring maximum uptime for the critical IT load. When best in class transformer manufacturing lead times are typically weeks, not days, an unexpected transformer failure will adversely affect the facility's reliability and profitability. Therefore, the ability to determine the electrical and mechanical health of a transformer can reduce the probability of costly, unplanned downtime. Routine diagnostic tests, including key fluid properties and dissolved gas analysis (DGA), can help determine the health of a liquid-filled transformer. Although sampling is not required for safe operation, it will provide the user with valuable information, leading to scheduled repair or replacement, and minimizing the duration and expense of an outage. With a dry-type transformer, there is no reliable way to measure the health or likelihood of an impending failure.

Solar transformer

As a result of the increasing number of states that are adopting aggressive Renewable & Alternative Energy Portfolio Standards, the solar energy market is growing—nearly doubling year over year. Eaton, a key innovator and supplier in this expanding market, is proud to offer its Cooper Power series Envirotran transformers specifically designed for Solar Photovoltaic medium-voltage applications. Eaton is working with top solar photovoltaic developers, integrators and inverter manufacturers to evolve the industry and change the way we distribute power.

In accordance with this progressive stance, every Envirotran Solar transformer is filled with non-toxic, biodegradable Envirotemp™ FR3™ dielectric fluid, made from renewable seed oils. On top of its biodegradability, Envirotemp™ FR3™ fluid substantially extends the life of the transformer insulation, saving valuable resources. What better way to distribute green power than to use a green transformer. In fact, delaying conversion to Envirotran transformers places the burden of today's environmental issues onto tomorrow's generations. Eaton can help you create a customized transformer, based on site specific characteristics including: temperature profile, site altitude, solar profile and required system life. Some of the benefits gained from this custom rating include:

- Reduction in core losses
- Improved payback on investment
- Reduction in footprint
- Improved fire safety
- Reduced environmental impact

For the solar photovoltaic industry, Eaton is offering standard step up transformers and dual secondary designs, including 4-winding, 3-winding (Low-High-Low) and 3-winding (Low-Low-High) designs.

Wind transformer

Eaton is offering custom designs for renewable energy power generation. Eaton manufactures its Cooper Power series Generator Step-Up (GSU) transformers for installation at the base of every wind turbine. Additionally, grounding transformers are available for wind power generation.

DOE efficiency

The United States Department of Energy (DOE) has mandated efficiency values for most liquid type, medium voltage transformers. As a result, all applicable Eaton's Cooper Power series transformers 2500 kVA and below conform to efficiency levels as specified in the DOE ruling "10 CFR Part 431 Energy Conservation Program".

Underwriters Laboratories® (UL®) Listed and Labeled/ Classified

The Envirotran transformer from Eaton can be specified as UL® Listed & Labeled, and/or UL® Classified. Underwriters Laboratories (UL®) listing is a verification of the design and construction of the transformer to the ANSI® and IEEE® standards. UL® listing generally is the most efficient, cost-effective solution for complying with relevant state and local electrical codes. UL® Combination Classification/Listing is another way in which to comply with Section 450.23, 2008 NEC® requirements. This combines the UL® listed transformer with a UL® Classified Less-Flammable Liquid and complies with the use restrictions found within the liquid Classification.

c UL US
LISTED

K-Factor transformer

With a drastic increase in the use of ferromagnetic devices, arcing devices, and electric power converters, higher frequency loads have increased significantly. This harmonic loading has the potential to generate higher heat levels within a transformer's windings and leads by as much as 300%. Harmonic loading has the potential to induce premature failure in standard-design distribution transformers.

In addition to standard UL® "K-Factor" ratings, transformers can be designed to customer-provided specifications detailing precise loading scenarios. Onsite measurements of magnitude and frequency, alongside harmonic analysis of the connected load can be performed by Eaton engineers or a third party consultant. These field measurements are used to determine exact customer needs and outline the transformer specifications.

Eaton will design harmonic-resistant transformers that will be subjected to the unique harmonic loads. These units are designed to maintain normal temperature rise under harmonic, full-load conditions. Standard UL® "K-Factor" designs can result in unnecessary costs when the "next-highest" K-Factor must be selected for a calculated design factor. To save the customer these unnecessary costs, Eaton can design the transformer to the specific harmonic spectrum used in the application. Eaton's Cooper Power series K-factor transformers are filled with mineral oil or Envirotemp™ FR3™ fluid and enjoy the added benefits of dielectric cooling such as higher efficiencies than dry-type transformers.

Modulation transformer

Bundled with an Outboard Modulation Unit (OMU) and a Control and Receiving Unit (CRU), a Modulation Transformer Unit (MTU) is designed to remotely achieve two way communication.

The use of an MTU reduces travel time and expense versus traditional meter reading performed by high voltage electricians. Additionally, with MTU it is possible to manage and evaluate energy consumption data, providing reduced metering costs and fewer tenant complaints.

An MTU utilizes existing utility infrastructure, therefore eliminating the need to engineer and construct a dedicated communication network.

Figure 9. Modular transformer.

Inverter/rectifier bridge

Eaton complements its range of applications for transformers by offering dual winding designs. These designs are intended for connection to 12-pulse rectifier bridges.

Product attributes

To set us apart from other transformer manufactures, Eaton includes the following guarantees with every three-phase pad-mounted transformer.

Engineered to order (ETO)

Providing the customer with a well developed, cost-effective solution is the number one priority at Eaton. Using customer specifications, Eaton will work with the customer from the beginning to the end to develop a solution to fit their needs. Whether it is application specific, site specific, or a uniquely specified unit, Eaton will provide transformers with the best in class value and performance, saving the customer time and money.

Made in the U.S.A.

Eaton's three-phase pad-mounted transformers are produced right here in the United States of America. Our manufacturing facilities are positioned strategically for rapid shipment of products. Furthermore, should the need arise, Eaton has a broad network of authorized service repair shops throughout the United States.

Superior paint performance

Protecting transformers from nature's elements worldwide, Eaton's E-coat system provides unrivaled transformer paint life, and exceeds IEEE Std C57.12.28™-2014 and IEEE Std C57.12.29™-2005 standards. In addition to the outside of the unit, each transformer receives a gray E-coat covering in the interior of the tank and cabinet, providing superior rust resistance and greater visibility during service.

If the wide range of standard paint selections does not suit the customer's needs, Eaton will customize the paint color to meet their requirements.

Rectangular coil design

Eaton utilizes a rectangular coil design. This winding technique results in a smaller overall unit footprint as well as reducing the transformer weight. The smaller unit size does not hinder the transformer performance in the least. Units have proven short circuit withstand capabilities up to 10 MVA.

Testing

Eaton performs routing testing on each transformer manufactured including the following tests:

- Insulation Power Factor: This test verifies that vacuum processing has thoroughly dried the insulation system to required limits.
- Ratio, Polarity, and Phase Relation: Assures correct winding ratios and tap voltages; checks insulation of HV and LV circuits. Checks entire insulation system to verify all live-to-ground clearances.
- Resistance: This test verifies the integrity of internal high-voltage and low-voltage connections; provides data for loss upgrade calculations.
- Routine Impulse Tests: The most severe test, simulating a lightning surge. Applies one reduced wave and one full wave to verify the BIL rating.
- Applied Potential: Applied to both high-voltage and low-voltage windings, this test stresses the entire insulation system to verify all live-to-ground clearances.
- Induced Potential: 3.46 times normal plus 1000 volts for reduced neutral designs.
- Loss Test: These design verification tests are conducted to assure that guaranteed loss values are met and that test values are

within design tolerances. Tests include no-load loss and excitation current along with impedance voltage and load loss.

- Leak Test: Pressurizing the tank to 7 psig assures a complete seal, with no weld or gasket leaks, to eliminate the possibility of moisture infiltration or fluid oxidation.

Design performance tests

The design performance tests include the following:

- Temperature Rise: Our automated heat run facility ensures that any design changes meet ANSI® and IEEE® temperature rise criteria.
- Audible Sound Level: Ensures compliance with NEMA® requirements.
- Lightning Impulse: To assure superior dielectric performance, this test consists of one reduced wave, two chopped waves and one full wave in sequence, precisely simulating the harshest conditions.

Thomas A Edison Research and Test Facility

We are constantly striving to introduce new innovations to the transformer industry, bringing you the highest quality transformer for the lowest cost. Eaton's Cooper Power series Transformer Products are ISO 9001 compliant, emphasizing process improvement in all phases of design, manufacture, and testing. We have invested millions of dollars in the Thomas A. Edison Technical Center, our premier research facility in Franksville, Wisconsin affirming our dedication to introducing new innovations and technologies to the transformer industry. This research facility is fully available for use by our customers to utilize our advanced electrical and chemical testing labs.

Notes:

Page 3- NETSIAN Part I: Product Data: The part number listed (61646-12) for the Indoor/Outdoor Tight Buffered OM2 12 Fiber is not listed in the table on page 84. Should the part number be 61464-12? Yes, please see REV. A submittal with the correct part number.

The Buffer Tube Fan-Out Kits on Page 2 of the CORNING the Design table lists the cable type to be cable with 250UM. Will this be compatible with the 50UM fiber? Yes, this fan out kit is compatible with the fiber specified. The 250UM is the coating around the fiber core and cladding, the 50UM is the core size of the fiber.

Tight Buffered

2 through 144 fibers

HITACHI
Inspire the Next

Product Highlights

- REACH & RoHS 2 compliant.
- Made in USA.
- All multimode, and singlemode cables (except OM1) utilize bend-insensitive optical fibers.
- UV and fungus resistent jacket.
- Tight buffered construction.
- Easy to strip and terminate.
- Each fiber is color coded for easy identification.
- Dry, super absorbent polymers (SAPs) eliminate water migration in cable interstices.
- Suitable for lashed aerial, duct, underground conduit and indoor plenum applications.
- 900 um buffered design recommended for easy termination.
- Cables with more than 24 fibers have fibers segregated into 12-fiber sub-units.

Options

- OM4 optical fibers with extended 10 gigabit Ethernet distances are available.
- OS2 optical fibers with enhanced bend-insensitive performance are available.
- Wideband multimode fiber is available.

Applications

- Applications include 10, 40 & 100 gigabit Ethernet, Fibre Channel, Video, Security, Automation.

Standards

- TIA/EIA-568-C.3
- ISO/IEC 11801, 2nd edition
- Telcordia GR-409-CORE

WME-02 shown fully loaded

Wall Mount Interconnect Enclosure (WME) with Two LGX® Mounting Positions

AFL's wall mount interconnect enclosure (WME02) provides a convenient convergence point for interconnecting and/or splicing in wall mount applications. Provisioned for up to two LGX compatible adapter plates or optical modules, the enclosure features a well-engineered solution for fiber and cable management on both the ingress and egress openings of the enclosure. Robust steel construction ensures the highest level of protection for sensitive components while integrated roll-formed hinges eliminate possible fiber pinch points while deploying or servicing components within. The WME02 features discrete access doors for provider and customer access which are independently lockable with a common pad-lock or tube-style keyed lock.

Features

- Fits comfortably into new and existing interconnect, cross-connect and co-location environments
- U-shaped cable entry eliminates the need to feed preconnectorized cables through an inconvenient access port
- Modular design fully compatible with Poli-MOD® products and XFM optical cassettes
- Dual doors with separate locking options for flexibility and security
- Available empty, with adapters, or with adapters, splice trays and pigtails pre-installed
- LGX 118 compatible
- Optional splice tray and holder (ordered separately)
- All major connector types are supported

Applications

- Co-Location sites
- Customer premise
- Hub/OTN sites
- Telecommunication closets
- Campus/enterprise environments

Specifications

- Solid steel construction
- Powder coat black textured finish
- Top or bottom cable entry with dust resistant grommets
- Dual-hasp locking/security system
- 12 to 24 fiber patch and splice density
- Two LGX mounting positions
- Physical dimensions: 12.0"H x 14.0"W x 2.5"D
- Empty version weight: 10.65 lbs.

LightLink Adapter Plates

LightLink Adapter Plates add versatility to AFL's panel product line. Adapter plates are compatible with industry standard platforms allowing for easy upgrades to existing panels. Adapter Plates come preloaded with adapters and are available in 6, 8, 12 and 24 pack versions for single-fiber adapters. Higher fiber counts are achievable with multi-fiber adapters. Blank plates are also available for unused space in panels.

Features

- Metal Plate with Nylatches
- Polyurethane powder coated (white or black)
- LGX® compatible

Field Master® Field-Installable Connectors

Field Master Connectors, for field-termination of fiber optics, feature high-precision, high-reliability and low-applied connector cost. Durable metal components, industry-standard connector designs, and proven crimp technology give the customer peace-of-mind that their installed network is steady and reliable. Field Master Tool Kits come complete with all necessary tools and consumables for the professional installation of Field Master Connectors.

Features

- High-precision ceramic ferrules ensure fiber alignment and repeatable performance
- Rugged metal connector bodies provide sturdy cable terminations
- Industry standard interfaces allow interoperability with media equipment
- Meets EIA/TIA 568B performance requirements
- Field proven crimp technology improves connector/cable tensile performance

Applications

- Premise environments
- Desk for LAN environments
- Patch panels
- Direct equipment termination
- Fiber to the Subscriber (FTTx) applications
- Repair / replacement requirements

Buffer Tube Fan-Out Kits, Indoor

12 F, 25-in legs

CORNING

Corning Cable Systems Indoor Buffer Tube Fan-Out Kits are specifically designed for the termination of 6- and 12-fiber buffer tubes. These buffer tube fan-out kits provide the ultimate solution for those users who want to field-install connectors on 250 µm coated fibers. The kits provide the most compact, easy-to-install fan-out solution requiring no additional hardware or space than that required for terminating tight-buffered cables. Indoor Kits feature a 900 µm Fan-Out Assembly that is color-coded to match the fiber color scheme. The Fan-Out Assembly is available with 6- or 12-fiber units in lengths of 0.6 m (25-in) or 1.2 m (47-in). These different lengths provide the installer the flexibility needed for a variety of hardware options.

Part Number: FAN-BT25-12

Features and Benefits

Snap-together furcation
Eliminates epoxy for indoor kits

Fiber routing capabilities
Better fiber management

Compensation for wide temperature fluctuation
Outdoor use

Specifications

General Specifications	
Environment	Indoor
Fanout Type	Buffer Tube
Product Type	Fan-Out Kits

Subject: FW: KAFB 106239 Conveyance Line (COA Proj. No. 586082)

USACE TEAM,

Just catching you up on the email trail between George Nemeth (EOR with Smith Engineering our sub) and COA DRC.

Good news is as-builts will cover field change, not formal change needed with COA DRC approval.

RMCI (EA sub) is evaluating the options. I will hopefully have answer tomorrow and assume they will chose HDD….but we will see.

George, good to see you are busy.

For going over the SAS with a flexible pipe material flow fill will need to be used see Drw. 2381 The flow fill would distribute the point load across the SAS line.
For going under and excavating around the SAS line usually an encasement works to keep any sag from poor backfill, (Drw 2140), But if sometimes if the trench is narrow flow fill will
work as long as it is under the line filling the void supporting against natural ground.
For directional drilling under, as long as the void is filled with mud.

Let me know if you have questions.

Subject: RE: KAFB 106239 Conveyance Line (COA Proj. No. 586082)

Jeanne – Thanks for the feedback. RMCI had contacted Reuben Ortega with ABCWUA and Reuben contacted me.

The proposed installation would only have a couple of inches between the top of the existing SAS and the bottom of encasement. That would put us at absolute minimum cover.

Right now, regarding the sewer line crossing at about Sta 5+35, the contractor is weighing the pros and cons of three installation options.

1. installing per plan and going under the existing SAS and supporting the SAS across the trench,
2. realigning vertically to go over the SAS,
3. or performing a short directional drill to go under the SAS and avoid an open trench where the SAS would need to be supported.

I'll keep you posted on a final decision.

Thanks again.

George

Mostly, I have no issue with the changes, and they can be handled by as-built. I am ccing Tim Cynova of the ABCWUA to review the alignment changes based on discussion below.

Who at the ABCWUA asked for the full encasement on the SAS? (We don't typically place a line directly on top of an encasement so some type of clearance might be requested. Are you right at minimum cover?)

Subject: KAFB 106239 Conveyance Line (COA Proj. No. 586082)

Jeanne – Per our phone conversation earlier today, I am sending you the attached documents.

The first 4 sheets (C-201, C-202, C-205, C-206) show the changes in vertical and horizontal alignment of the pipeline as well as additional lengths of direction drill installation instead of open trench installation.

Also, as shown on sheet C-202, ABCWUA has required a full encasement of the existing SAS line for 10 feet to each side of the crossing point. The encasement detail is included as the 5th sheet in the attachment.

Please let me know if we need to make a formal submittal to DRC and obtain formal DRC approval of these changes or if we can just as-built the changes.

Thanks.

Cc: Ed Hyde <ehyde@rmciinc.com>; Jerry Patton <jpatton@rmciinc.com>
Subject: KAFB Conveyance Line; Vertical Alignment Change

Tyler,

This email is to document that vertical alignment changes are going to occur in the field to reduce the impact on the asphalt replacement on City Right-of-Way. RMCI and EA Engineering will work together in the field to determine the best vertical alignment to suit the needs of the project. These vertical alignment changes are to prevent large amounts of asphalt replacement in the City of Albuquerque Right-of-Way and to prevent having deeper excavations near the roadway. By making these field changes, RMCI and EA will prevent excessive asphalt replacement, larger amounts of import materials and prevent any additional safety concerns with large excavations so close to the roadway. Please note by making these field changes, that there will be the potential for low spots (although these will be tried to be mitigated) along the pipeline and for the directional drilling locations. RMCI and EA will make field determinations to mitigate these low points as much as possible. RMCI will as-built these changes at the end of the project for project record. RMCI and EA will also coordinate to make sure the minimum bury requirements are met as well.

Please respond to this email documenting that this is correct. After receipt of the response, RMCI will document this through a formal RFI.

Thanks,

Phillip Johnson

Subject: [EXTERNAL] Kirtland BFF - Field Change: KAFB-106228 Conduit Reroute

USACE Team,

During potholing EA discovered that the electric and controls conduit for KAFB-106228 is located on top of the existing dual wall conveyance line. As a result EA's KAFB-106239 conveyance line installation subcontractors will not be able to maneuver equipment in and around the existing line to tie into the existing conveyance line without rerouting the conduit. EA has reviewed Wilson Electric's plan to reroute the conduit (attached) and would like to obtain USACE approval prior to conducting this field change. Please let us know if you have any questions.

Thank you,

Kevin McKeage, E.I.

Engineer

MECHANICAL GENERAL NOTES

SPECIFICATIONS:

PART 1 GENERAL

1.1 SCOPE OF WORK

A. FURNISH ALL LABOR, INSTALL ALL MATERIALS AND EQUIPMENT SERVICES AND INCIDENTALS TO THE PROPER INSTALLATION OF WORK DETAILS.
B. GUARANTEE WORK TO BE FREE OF DEFECTS OF MATERIAL AND WORKMANSHIP FOR A PERIOD OF ONE YEAR AFTER DATE OF FINAL ACCEPTANCE OR AS REQUIRED BY SPECIFICATION AS APPLICABLE.
C. OBTAIN AND PAY FOR ALL REQUIRED PERMITS, FEES, AND INSPECTIONS, COORDINATE WITH ALL OTHER TRADES, APPLICABLE SPECIFICATIONS, DRAWINGS AND OWNER'S DIRECTIONS.

1.2 GENERAL CONDITIONS

A. SURVEY THE JOB SITE TO OBTAIN A FULL UNDERSTANDING OF THE WORK INVOLVED. ADDITIONAL FEES WILL NOT BE PAID FOR MISSED OR OVERLOOKED CONDITIONS REQUIRING ADDITIONAL WORK IF DETERMINED BY THE ENGINEER THAT SAID CONDITIONS COULD HAVE BEEN REASONABLY DETECTED DURING THE JOB SURVEY.
B. THE MECHANICAL DRAWINGS SHOW THE RELATIONSHIP BETWEEN EQUIPMENT AND SITE CONDITIONS. DO NOT SCALE THE DRAWINGS FOR EXACT SIZE OR LOCATIONS. FABRICATION AND/OR INSTALLATION DETAILS ARE MORE SPECIFIC AND SHOULD BE CLOSELY FOLLOWED.
C. THE MECHANICAL COMPONENTS SHALL BE INSTALLED IN ACCORDANCE WITH MANUFACTURER'S RECOMMENDATIONS, THE LOCAL / STATE BUILDING AND RELATED CONSTRUCTION CODES.

1.3 SYSTEM DESCRIPTION

A. EQUIPMENT SELECTIONS AS REPRESENTED ON DRAWINGS ARE FOR DESIGN PURPOSES ONLY. EQUIPMENT TYPE, PHYSICAL SIZE, WEIGHT, CAPACITIES AND PERFORMANCE CHARACTERISTICS SHALL BE GOVERNING FACTORS IN SUBMITTING "OR EQUALS" FOR REVIEW AND APPROVAL.
B. SUPPORT SYSTEMS HAVE BEEN DESIGNED FOR THE COMPONENTS AND PIPING SYSTEMS WITH SPECIFIED SPANS AND COMPONENT SUPPLIER RECOMMENDATIONS FOR SUPPORT / ANCHORING. THE ABSENCE OF SUPPORT DETAILS ON THE CONTRACT DRAWINGS DOES NOT RELIEVE THE CONTRACTOR OF THE RESPONSIBILITY FOR PROVIDING SUPPORTS / ANCHORS.

1.4 SUBMITTALS AND ACCEPTANCE

A. CONTRACTOR SHALL REPAIR, REPLACE, OR REPAINT TO MATCH ANY SURFACES OR COMPONENTS DAMAGED BY THE CONTRACTOR DURING THE INSTALLATION OF EQUIPMENT AND SYSTEMS.
B. CONTRACTOR SHALL REMOVE FROM THE JOB SITE ANY MATERIALS THAT ARE NOT USED OR NOT ECONOMICALLY RECOVERABLE.
C. EQUIPMENT SHOP DRAWINGS AND SUPPORT SYSTEM DETAIL DRAWINGS WILL SHOW PIPING SYSTEMS AND APPURTENANCES, SUCH AS MECHANICAL JOINTS, VALVES, LOCAL INSTRUMENTATION AND PIPE SUPPORTS. AS-BUILT DRAWINGS WILL SHOW PIPE SUPPORTS, AND LAYOUT OF PIPING SYSTEMS RELATIVE TO OTHER PARTS OF THE WORK INCLUDING CLEARANCES FOR MAINTENANCE AND OPERATION.
D. THE NAMES OF ALL QUALIFIED WELDERS, THEIR IDENTIFYING SYMBOLS, AND THE QUALIFYING PROCEDURES FOR EACH WELDER INCLUDING SUPPORT DATA SUCH AS TEST PROCEDURES USED, STANDARDS TESTED TO, ETC.
E. THE METHOD PROPOSED FOR DISPOSAL OF WASTE WATER FROM HYDROSTATIC TESTS AND ALL REQUIRED PERMITS, PRIOR TO PERFORMING HYDROSTATIC TESTS.
F. A SIGNED STATEMENT CERTIFYING THAT THE INSTALLATION IS SATISFACTORY AND IN ACCORDANCE WITH THE CONTRACT DRAWINGS, SPECIFICATIONS, AND THE MANUFACTURER'S PRESCRIBED PROCEDURES AND TECHNIQUES, UPON COMPLETION OF THE PROJECT AND BEFORE FINAL ACCEPTANCE.
G. THE MANUFACTURER'S INSTALLATION RECOMMENDATIONS OR INSTRUCTIONS FOR EACH MATERIAL OR PROCEDURE TO BE UTILIZED, INCLUDING MATERIALS PREPARATION.
H. A LIST OF ANY SPECIAL TOOLS NECESSARY FOR EACH PIPING SYSTEM AND APPURTENANCES FURNISHED FOR ADJUSTMENT, OPERATION, MAINTENANCE AND DISASSEMBLY OF THE SYSTEM.
I. HYDROSTATIC TEST REPORT.

1.5 DESIGN REQUIREMENTS

A. SUPPORT SYSTEMS SHALL BE SELECTED AND DESIGNED IN ACCORDANCE WITH MSS SP-58 AND MSS SP-69 WITHIN THE SPECIFIED SPANS AND COMPONENT REQUIREMENTS. THE ABSENCE OF PIPE SUPPORTS AND DETAILS ON THE CONTRACT DRAWINGS DOES NOT RELIEVE THE CONTRACTOR OF RESPONSIBILITY FOR SIZING AND PROVIDING SUPPORTS THROUGHOUT FACILITY.
B. ABOVE GRADE PIPING SYSTEMS SHALL BE SUITABLE FOR DESIGN CONDITIONS, CONSIDERING THE PIPING BOTH WITH AND WITHOUT INTERNAL PRESSURE, AND INSTALLATION FACTORS SUCH AS INSULATION, SUPPORT SPANS, AND AMBIENT TEMPERATURES. CONSIDERATION SHALL BE GIVEN TO ALL OPERATING AND SERVICE CONDITIONS BOTH INTERNAL AND EXTERNAL TO THE PIPING SYSTEMS. WALL PENETRATIONS SHALL BE VERIFIED AND THE SIZE AND LOCATION COORDINATED WITH THE OWNER PRIOR TO CONSTRUCTION.

1.6 REFERENCES

1.7 DELIVERY, STORAGE, AND HANDLING

A. MATERIALS DELIVERED AND PLACED IN STORAGE SHALL BE STORED WITH PROTECTION FROM THE WEATHER, EXCESSIVE HUMIDITY VARIATION, EXCESSIVE TEMPERATURE VARIATION, DIRT, DUST AND/OR OTHER CONTAMINANTS. PROPER PROTECTION AND CARE OF MATERIAL BEFORE, DURING AND AFTER INSTALLATION IS THE CONTRACTOR'S RESPONSIBILITY. ANY MATERIAL FOUND TO BE DAMAGED SHALL BE REPLACED AT THE CONTRACTOR'S EXPENSE. DURING INSTALLATION, PIPING SHALL BE CAPPED TO KEEP OUT DIRT AND OTHER FOREIGN MATTER.

PART 2 PRODUCTS

2.1 MATERIALS, EQUIPMENT AND STANDARD PRODUCTS

A. PROVIDE PIPING MATERIALS AND APPURTENANCES AS SPECIFIED AND AS SHOWN ON THE DRAWINGS, AND SUITABLE FOR THE SERVICE INTENDED. PIPING MATERIALS, APPURTENANCES, AND EQUIPMENT SUPPLIED AS PART OF THIS CONTRACT SHALL BE OF EQUAL MATERIAL AND RATINGS AS THE CONNECTING PIPE, NEW AND UNUSED EXCEPT FOR TESTING EQUIPMENT. COMPONENTS THAT SERVE THE SAME FUNCTION AND ARE THE SAME SIZE SHALL BE IDENTICAL PRODUCTS OF THE SAME MANUFACTURER. THE GENERAL MATERIALS TO BE USED FOR THE PIPING SYSTEMS SHALL BE IN ACCORDANCE WITH THE PROCESS AND INSTRUMENTATION DIAGRAMS (P&ID'S) (SEE CB&I PHASE IV MID-PLUME PUMP & TREAT SYSTEM EXPANSION DRAWINGS) AND MECHANICAL PIPING DRAWINGS. PIPE FITTINGS SHALL BE COMPATIBLE WITH THE APPLICABLE PIPE MATERIALS.
B. PROVIDE MATERIAL AND EQUIPMENT WHICH ARE THE STANDARD PRODUCTS OF A MANUFACTURER REGULARLY ENGAGED IN THE MANUFACTURING OF THE PRODUCTS AND THAT ESSENTIALLY DUPLICATE ITEMS THAT HAVE BEEN IN SATISFACTORY USE FOR AT LEAST 2 YEARS PRIOR TO BID OPENING. NOMINAL SIZES FOR STANDARDIZED PRODUCTS SHALL BE USED. PIPE, VALVES, FITTINGS AND APPURTENANCES SHALL BE SUPPORTED BY A SERVICE ORGANIZATION THAT IS, IN THE OPINION OF THE CONTRACTING OFFICER, REASONABLY CONVENIENT TO THE SITE.

2.2 CARBON STEEL PIPING SYSTEM

A. ALL PIPING AND FITTINGS SHALL CONFORM TO THE FOLLOWING, UNLESS OTHERWISE INDICATED ON MECHANICAL PIPING DRAWINGS. CARBON STEEL PIPE SHALL MEET THE REQUIREMENTS OF ASTM A 53/A 53M SEAMLESS, GRADE B, SCHEDULE 40.
B. CARBON STEEL PIPING SHALL BE JOINED BY WELDING. DIELECTRIC FITTINGS OR ISOLATION JOINTS SHALL BE PROVIDED BETWEEN ALL DISSIMILAR METALS.
C. FITTINGS SHALL BE CARBON STEEL.
D. WELDING FITTINGS SHALL BE BUTT-WELDING. WELDING FITTINGS SHALL BE FORGED STEEL, CLASS 150 LOW-CARBON STEEL, ASTM A 234/ A 234 M SEAMLESS CONFORMING TO ASME B16.9.
E. THE INTERNAL DIAMETER BORES OF FLANGES AND FLANGED FITTINGS SHALL BE THE SAME AS THAT OF THE ASSOCIATED PIPE. THE FLANGES SHALL BE SLIP-ON TYPE. FLANGES AND FLANGED FITTINGS SHALL BE FORGED STEEL, ASTM A 105/A 105M OR WROUGHT CARBON STEEL, ASTM A 234/A234M, FACED AND DRILLED TO ASME B16.5 CLASS 150 WITH A 0.0625 INCH RAISED FACE. CAST STEEL BACKING FLANGES, ASTM A 216/A 216M GRADE WCA BOLTING SHALL BE ALLOY-STEEL ASTM A 193/A 193M GRADE B5 HEX HEAD BOLTS AND ASTM A 194/A 194M GRADE 8 HEX HEAD NUTS. WHEN MATING FLANGE ON VALVES OR EQUIPMENT IS CAST IRON, ASTM A 193/A 193M GRADE B8 CLASS 1BOLTS AND ASTM A 194/A 194M GRADE 8 HEAVY HEX HEAD NUTS SHALL BE USED. BOLTS SHALL BE PROVIDED WITH WASHERS OF THE SAME MATERIAL AS THE BOLTS. GASKETS SHALL MEET THE REQUIREMENTS OF ASME B16.5. NONMETALLIC GASKETS SHALL CONFORM TO ASME B16.21 AND BE A 0.125 INCH THICK CHLOROPRENE RUBBER, DUROMETER HARDNESS NO.80; 1,500 PSI MINIMUM TENSILE STRENGTH; 125 PERCENT MINIMUM ELONGATIONS AND FLAT RING TYPE FOR USE WITH RAISED FACE FLANGES.
F. IN CASES WHERE THE MATING FLANGES FOR EQUIPMENT, VALVES, AND SPECIALTY ITEMS ARE FLAT-FACED FLANGES, A SUBSTITUTE SLIP-ON TYPE FLAT-FACED FLANGE ON THE PIPING END SHOULD BE USED. FILLER FLANGES ARE ACCEPTABLE WITH PROPER GASKETS AND PRIOR APPROVAL FROM ENGINEERING.

2.3 VALVES

A. ALL VALVES SHALL CONFORM TO THE FOLLOWING UNLESS OTHERWISE SPECIFIED ON THE MECHANICAL PIPING DRAWINGS.
B. VALVES SHALL INCLUDE OPERATOR, ACTUATOR, HAND WHEEL, CHAIN WHEEL, EXTENSION STEM, FLOOR STAND, WORM AND GEAR OPERATOR, OPERATING NUT, CHAIN, WRENCH, AND ALL OTHER ACCESSORIES REQUIRED FOR A COMPLETE OPERATION. THE VALVES SHALL BE SUITABLE FOR THE INTENDED SERVICE. VALVES SHALL BE THE SAME SIZE AS ADJOINING PIPE UNLESS OTHERWISE INDICATED ON DRAWINGS. VALVE ENDS SHALL BE COMPATIBLE WITH ADJACENT PIPING SYSTEM. VALVES SHALL HAVE THE ABILITY TO EXCEPT LOCKS FOR LOCKOUT TAG, OUT REQUIREMENTS.
C. BALL VALVES, 2-INCH AND SMALLER, SHALL BE END ENTRY TYPE WITH BRONZE BODIES AND THREADED ENDS. VALVES SHALL HAVE POLYTETRAFLUOROETHYLENE (PTFE) PACKING AND SEATS, A STAINLESS STEEL BALL, REGULAR PORTS, AND HAND LEVER OPERATORS. VALVES SHALL BE RATED FOR 150 PSIG SERVICE AT 150 DEGREES F.
D. BUTTERFLY VALVES, 2- INCH AND LARGER, SHALL HAVE DUCTILE IRON BODIES; LUGGED STYLE. VALVES SHALL CONFORM TO AWWA C504 CLASS 125. DISCS SHALL BE CONTOURED AND NYLON COATED. THE VALVE SHAFTS SHALL BE STAINLESS STEEL WITH SELF-LUBRICATING, CORROSION-RESISTANT SLEEVE TYPE BEARINGS. VALVE SEATS SHALL BE ATTACHED TO EITHER THE VALVE BODY OR THE DISC AND SHALL BE CONSTRUCTED OF EPDM. VALVES 4-INCHES AND SMALLER SHALL HAVE MANUAL, LOCKING HAND LEVER OPERATORS. VALVES LARGER THAN 4-INCHES SHALL HAVE HAND WHEEL WITH GEAR OPERATORS.
E. GLOBE VALVES 3 INCH AND SMALLER, SHALL HAVE CARBON STEEL BODIES AND BONNETS, WITH STAINLESS STEEL TRIM. VALVES SHALL CONFORM TO ASME B16.34 CLASS 150, THREADED END CONNECTIONS. VALVES SHALL INCLUDE BONNETS, INSIDE SCREWS, RISING STEMS, CONVENTIONAL DISCS AND RINGS. VALVES SHALL BE RATED FOR 150 PSIG SERVICE AT 150 DEGREES F.

2.4 PIPING COMPONENTS

A. ALL PIPELINE LOW POINTS SHALL BE DRAINED. DRAIN VALVES SHALL BE LOCATED AS SHOWN ON MECHANICAL DRAWINGS.
B. PROCESS INTERCONNECTING PIPE SHALL BE CAPABLE OF BEING SAMPLED. SAMPLE VALVE SHALL BE LOCATED AS SHOWN ON MECHANICAL DRAWINGS.
C. COMBINATION AIR RELEASE VALVES SHALL BE INSTALLED AS NEEDED IN THE PIPELINE TO PREVENT UNCONTROLLED TRANSFER OF WATER BETWEEN VESSELS AND / OR THE BUILDING INFLUENT OR EFFLUENT CONNECTIONS. COMBINATION AIR RELEASE VALVES SHALL BE INSTALLED AS SHOWN ON MECHANICAL DRAWINGS.
D. BACKFLOW PREVENTERS SHALL BE INSTALLED AS SHOWN ON MECHANICAL DRAWINGS.

2.5 PIPE SUPPORTS AND PENETRATIONS

A. PROVIDE AUXILIARY STEEL WHERE THE SUPPORT OF PIPING SYSTEMS AND EQUIPMENT IS REQUIRED BETWEEN BUILDING STRUCTURAL ELEMENTS. REFER TO STRUCTURAL DRAWINGS (SEE CB&I PHASE IV MID-PLUME PUMP & TREAT SYSTEM EXPANSION DRAWINGS) FOR SPECIFIC DETAILS AND SUPPORT CONFIGURATIONS.
B. PIPE SUPPORTS SHALL CONFORM TO THE REQUIREMENTS OF MSS SP-69, AND MSS SP-58. WHERE PIPE SUPPORTS CONTACT BARE PIPING OR IN-LINE DEVICES, PROVIDE SUPPORTS OF COMPATIBLE MATERIAL SO THAT NEITHER SHALL HAVE A DETERIORATING ACTION ON THE OTHER.
C. REFER TO EQUIPMENT SECTIONS DRAWING FOR LOCATION OF WALL PENETRATION.

PART 3 EXECUTION

3.1 EXAMINATION AND PREPARATION

A. AFTER BECOMING FAMILIAR WITH ALL DETAILS OF THE WORK, VERIFY ALL DIMENSIONS IN THE FIELD, AND ADVISE THE CONTRACTING OFFICER OF ANY DISCREPANCY BEFORE PERFORMING THE WORK.
B. PIPE AND EQUIPMENT OPENINGS SHALL BE CLOSED WITH CAPS OR PLUGS DURING INSTALLATION. EQUIPMENT SHALL BE PROTECTED FROM DIRT, WATER, AND CHEMICAL OR MECHANICAL DAMAGE.
C. NOTIFY THE CONTRACTING OFFICER AT LEAST 2 WEEKS PRIOR TO THE FIELD FABRICATION OF PIPE OR FITTINGS AND AT LEAST 3 DAYS PRIOR TO THE START OF ANY SURFACE PREPARATION OR COATING APPLICATION WORK. WELDING ELECTRODES SHALL BE PROVIDED IN ACCORDANCE WITH THE APPLICABLE BASE METALS AND WELDING PROCESS. FABRICATION OF FITTINGS SHALL BE PERFORMED IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS.

3.2 EXPOSED PIPING INSTALLATION

A. EXPOSED PIPING SHALL BE RUN AS STRAIGHT AS PRACTICAL ALONG THE ALIGNMENT SHOWN ON THE CONTRACT DRAWINGS AND WITH A MINIMUM OF JOINTS. PIPING AND APPURTENANCES SHALL BE INSTALLED IN CONFORMANCE WITH REVIEWED SHOP DRAWINGS, MANUFACTURER'S INSTRUCTIONS AND ASME B31.3. PIPING SHALL BE INSTALLED WITHOUT SPRINGING OR FORCING THE PIPE.
B. PIPES SHALL BE THOROUGHLY CLEANED OF OIL, SCALE, RUST, AND DIRT IN ORDER TO PROVIDE A CLEAN SEAT FOR GASKETS. GASKETS SHALL BE WIPED CLEAN PRIOR TO INSTALLATION. FLEXIBLE COUPLINGS AND FLANGED COUPLING ADAPTER GASKETS SHALL BE LUBRICATED WITH THE MANUFACTURER'S STANDARD LUBRICANT BEFORE INSTALLATION ON THE PIPE ENDS. COUPLINGS, SERVICE SADDLES, AND ANCHOR STUDS SHALL BE INSTALLED IN ACCORDANCE WITH MANUFACTURER'S INSTRUCTIONS. BOLTS SHALL BE TIGHTENED PROGRESSIVELY, DRAWING UP BOLTS ON OPPOSITE SIDES A LITTLE AT A TIME UNTIL ALL BOLTS HAVE A UNIFORM TIGHTNESS. TORQUE-LIMITING WRENCHES SHALL BE USED TO TIGHTEN BOLTS.
C. PIPE FLANGES SHALL BE SET LEVEL, PLUMB, AND ALIGNED. FLANGED FITTINGS SHALL BE INSTALLED TRUE AND PERPENDICULAR TO THE AXIS OF THE PIPE. THE BOLT HOLES SHALL BE CONCENTRIC TO THE CENTERLINE OF THE PIPE.
D. VALVES SHALL BE LOCATED IN ACCORDANCE WITH THE CONTRACT DRAWINGS WHERE ACTUATORS ARE SHOWN. WHERE ACTUATORS ARE NOT SHOWN, VALVES SHALL BE LOCATED AND ORIENTED TO PERMIT EASY ACCESS TO THE VALVE OPERATOR, AND TO AVOID INTERFERENCES.

3.3 VALVE INSTALLATION

A. FLANGED VALVE BOLT HOLES SHALL BE INSTALLED SO AS TO STRADDLE THE VERTICAL CENTERLINE OF PIPE. FLANGED FACES SHALL BE CLEANED PRIOR TO INSERTING THE GASKET AND BOLTS, AND THEN THE NUTS SHALL BE TIGHTENED PROGRESSIVELY AND UNIFORMLY. THREADED ENDS SHALL HAVE THE THREADS CLEANED BY WIRE BRUSHING OR SWABBING PRIOR TO INSTALLATION.
B. THE OPERATING STEM OF A MANUAL VALVE SHALL BE INSTALLED IN A VERTICAL POSITION WHEN THE VALVE IS INSTALLED IN HORIZONTAL RUNS OF PIPE HAVING CENTERLINE ELEVATIONS 4.5 FEET OR LESS ABOVE FINISHED FLOOR, UNLESS OTHERWISE SHOWN ON MECHANICAL PIPING DRAWINGS. THE OPERATING STEM OF A MANUAL VALVE SHALL BE INSTALLED IN A HORIZONTAL POSITION IN HORIZONTAL RUNS OF PIPE HAVING CENTERLINE ELEVATIONS BETWEEN 4.5 FEET AND 6.75 FEET ABOVE FINISH FLOOR, UNLESS OTHERWISE SHOWN ON MECHANICAL PIPING DRAWINGS. AUTOMATIC VALVES SHALL BE INSTALLED IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS.

3.4 PIPING SUPPORT SYSTEMS INSTALLATION

A. THE ABSENCE OF PIPE SUPPORTS AND DETAILS ON THE MECHANICAL PIPING DRAWINGS SHALL NOT RELIEVE THE CONTRACTOR OF RESPONSIBILITY FOR SIZING AND PROVIDING SUPPORTS THROUGHOUT PLANT.
B. PIPE SUPPORT SYSTEMS SHALL MEET THE REQUIREMENTS OF MSS SP-58. CONTRACTOR-DESIGNED AND SELECTED SUPPORT SYSTEMS SHALL BE INSTALLED IN ACCORDANCE WITH MSS SP-69, AND AS SPECIFIED HEREIN. PIPING CONNECTIONS TO EQUIPMENT SHALL BE SUPPORTED BY PIPE SUPPORTS AND NOT OFF THE EQUIPMENT. LARGE OR HEAVY VALVES, FITTINGS, AND/OR EQUIPMENT SHALL BE SUPPORTED INDEPENDENTLY OF ASSOCIATED PIPING. PIPES SHALL NOT BE SUPPORTED OFF OTHER PIPES. SUPPORTS SHALL BE PROVIDED AT PIPING CHANGES IN DIRECTION OR IN ELEVATION, ADJACENT TO FLEXIBLE JOINTS AND COUPLINGS, AND WHERE OTHERWISE SHOWN ON THE CONTRACT DRAWINGS. PIPE SUPPORTS AND HANGERS SHALL NOT BE INSTALLED IN EQUIPMENT ACCESS AREAS OR BRIDGE CRANE RUNS. HANGING PIPES SHALL BE BRACED AGAINST HORIZONTAL MOVEMENT BY BOTH LONGITUDINAL AND LATERAL SWAY BRACING. AT EACH CHANNEL TYPE SUPPORT, EVERY PIPE SHALL BE PROVIDED WITH AN INTERMEDIATE PIPE GUIDE, EXCEPT WHERE PIPE ANCHORS ARE REQUIRED. EXISTING SUPPORT SYSTEMS MAY BE USED TO SUPPORT ADDITIONAL NEW PIPING ONLY IF THE CONTRACTOR CAN DEMONSTRATE THAT THE EXISTING SUPPORT SYSTEMS ARE ADEQUATE FOR THE ADDITIONAL LOADS, OR IF THE EXISTING SYSTEMS ARE STRENGTHENED TO SUPPORT THE ADDITIONAL LOADS. PEDESTAL TYPE PIPE SUPPORTS SHALL BE PROVIDED UNDER BASE FLANGES ADJACENT TO ROTATING EQUIPMENT AND WHERE REQUIRED TO ISOLATE VIBRATION. PIPING 2.5 INCH IN DIAMETER AND LARGER SHALL BE BRACED FOR SEISMIC FORCES. LATERAL SUPPORTS FOR SEISMIC LOADS SHALL BE INSTALLED AT ALL CHANGES IN DIRECTION.

3.5 PIPE PAINTING, COLOR CODING AND IDENTIFICATION

A. PAINT AND COLOR CODING REQUIREMENTS FOR EXPOSED PIPING SHALL BE IN ACCORDANCE WITH SECTION 099000 – PAINTS AND COATINGS (CB&I PHASE IV MID-PLUME PUMP & TREAT SYSTEM EXPANSION SPECIFICATIONS).

3.6 FIELD QUALITY CONTROL

A. HYDROSTATIC TESTING SHALL BE CONDUCTED IN ACCORDANCE WITH ASME B31.3. PIPING SYSTEMS SHALL BE TESTED UNDER NORMAL SERVICE CONDITIONS (AS INDICATED IN THE PIPE SCHEDULE IN THE CONTRACT DRAWINGS) TO DEMONSTRATE COMPLIANCE. THE TEST PRESSURE SHALL NOT BE LESS THAN 1.5 TIMES THE DESIGN PRESSURE. WATER SHALL BE USED AS THE HYDROSTATIC TEST FLUID. PROVIDE CLEAN TEST WATER OF SUCH QUALITY TO PREVENT CORROSION OF THE PIPING SYSTEM MATERIALS. AIR RELEASE VENTS SHALL BE OPENED AT ALL HIGH POINTS OF THE PIPING SYSTEM IN ORDER TO PURGE AIR POCKETS WHILE THE PIPING SYSTEM IS FILLING.
B. FOR RIGID PIPING HYDROSTATIC TESTING, THE MAXIMUM TEST PRESSURE SHALL BE CALCULATED ACCORDING TO ASME B31.3, BUT SHALL NOT EXCEED THE YIELD STRENGTH OF THE PIPING SYSTEM. THE MAXIMUM VELOCITY DURING FILLING SHALL BE IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS. VENTING DURING FILLING MAY ALSO BE PROVIDED BY LOOSENING FLANGES WITH A MINIMUM OF FOUR BOLTS OR BY THE USE OF EQUIPMENT VENTS. TEST ALL PARTS OF THE PIPING SYSTEM. THE HYDROSTATIC TEST PRESSURE SHALL BE MAINTAINED CONTINUOUSLY FOR 30 MINUTES MINIMUM AND FOR SUCH ADDITIONAL TIME AS NECESSARY TO CONDUCT EXAMINATIONS FOR LEAKAGE. ALL JOINTS AND CONNECTIONS SHALL BE EXAMINED FOR LEAKAGE. THE PIPING SYSTEM, EXCLUSIVE OF POSSIBLE LOCALIZED INSTANCES AT PUMP OR VALVE PACKING, SHALL SHOW NO VISUAL EVIDENCE OF LEAKING. CORRECT VISIBLE LEAKAGE AND RETEST. UNLESS OTHERWISE DIRECTED BY THE CONTRACTING OFFICER, THE PIPING SYSTEM SHALL BE LEFT FULL OF WATER AFTER LEAKS ARE REPAIRED.
C. FOR NON-RIGID, NON-METALLIC PIPING HYDROSTATIC TESTING, THE MAXIMUM TEST PRESSURE SHALL BE CALCULATED ACCORDING TO ASME B31.3, BUT SHALL NOT EXCEED 1.5 TIMES THE MAXIMUM PRESSURE RATING OF THE LOWEST RATED COMPONENT IN THE PIPING SYSTEM. THE MAXIMUM VELOCITY DURING FILLING SHALL BE IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS. THE SYSTEM SHALL BE INITIALLY PRESSURIZED TO 50 PERCENT OF THE NORMAL SERVICE CONDITIONS AND INSPECTED. ANY LEAKS SHALL BE REPAIRED BY THE CONTRACTOR. THE SYSTEM SHALL THEN BE PRESSURIZED TO THE TEST PRESSURE. SMALL AMOUNTS OF WATER SHALL BE ADDED AS REQUIRED ON A HOURLY BASIS FOR A MAXIMUM OF 3 HOURS IN ORDER TO MAINTAIN THE TEST PRESSURE. AFTER 4 HOURS, THE TEST PRESSURE SHALL BE LOWERED BY 10.0 PSI. IF THE HYDROSTATIC PRESSURE REMAINS STEADY FOR 1 HOUR, THEN NO LEAKAGE IS INDICATED. INSPECT FOR LEAKS, REPAIR AND RETEST IF NECESSARY. THE PIPING SYSTEM SHALL BE ALLOWED TO RELAX FOR 8 HOURS BEFORE RETESTING.
D. TESTS FOR ABOVE GROUND PRESSURE PIPING SHALL BE CONDUCTED AFTER THE PIPING HAS BEEN COMPLETELY INSTALLED, INCLUDING ALL SUPPORTS, HANGERS, AND ANCHORS, AND INSPECTED FOR PROPER INSTALLATION BUT PRIOR TO INSTALLATION OF INSULATION.
E. VALVES MAY EITHER BE TESTED WHILE TESTING PIPELINES, OR AS A SEPARATE STEP. IT SHALL BE DEMONSTRATED THAT VALVES OPEN AND CLOSE SMOOTHLY WITH OPERATING PRESSURE ON ONE SIDE AND ATMOSPHERIC PRESSURE ON THE OTHER, AND IN BOTH DIRECTIONS FOR TWO-WAY VALVE APPLICATIONS. COUNT AND RECORD THE NUMBER OF TURNS REQUIRED TO OPEN AND CLOSE EACH VALVE, AND ACCOUNT FOR ANY DISCREPANCIES WITH MANUFACTURER'S DATA. AIR AND VACUUM RELIEF VALVES SHALL BE EXAMINED AS THE ASSOCIATED PIPE IS BEING FILLED TO VERIFY VENTING AND SEATING IS FULLY FUNCTIONAL. SET, VERIFY, AND RECORD SET PRESSURES FOR ALL RELIEF AND REGULATING VALVES. SELF-CONTAINED AUTOMATIC VALVES SHALL BE TESTED AT BOTH MAXIMUM AND MINIMUM OPERATING RANGES, AND RESET UPON COMPLETION OF TEST TO THE DESIGN VALUE. [AUTOMATIC VALVES THAT ARE NOT SELF-CONTAINED SHALL BE TESTED IN CONJUNCTION WITH CONTROL SYSTEM TESTING.]

3.7 INTERIM / FINAL CLEANING

A. PREVENT THE ACCUMULATION OF WELD ROD, WELD SPATTER, PIPE CUTTINGS AND FILINGS, GRAVEL, CLEANING RAGS, AND OTHER FOREIGN MATERIAL WITHIN PIPING SECTIONS DURING FABRICATION. THE PIPING SHALL BE EXAMINED TO ASSURE REMOVAL OF THESE AND OTHER FOREIGN OBJECTS PRIOR TO ASSEMBLY AND INSTALLATION.

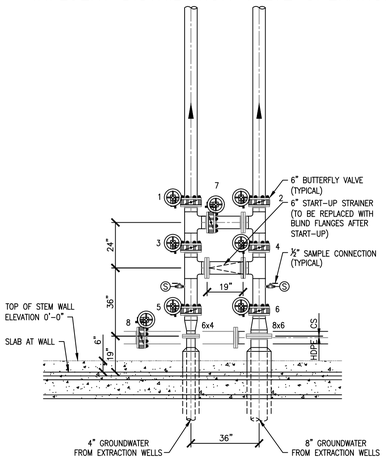
PROCESS EQUIPMENT SCHEDULE - TREATMENT PLANT EXPANSION

IDENT.	EQUIPMENT TYPE	DESCRIPTION	SUPPLIED BY	INSTALLED BY	REMARKS
SF-101	SAND FILTER	SAND FILTER UNIT MODEL MM 5460-2A (160-477 GPM) AS PRETREATMENT FOR BIOLOGIC FOULING AND IRON AND MANGANESE REMOVAL OF TREATMENT TRAIN #1	YARDNEY	CONTRACTOR	1, 2, 3
SF-102	SAND FILTER	SAND FILTER UNIT MODEL MM 5460-2A (160-477 GPM) AS PRETREATMENT FOR BIOLOGIC FOULING AND IRON AND MANGANESE REMOVAL OF TREATMENT TRAIN #2	YARDNEY	CONTRACTOR	1, 2, 3
CI-101	CHLORINE INJECTOR	SODIUM HYPOCHLORITE INJECTION SYSTEM, GRUNDFOS DOSING TANK STATION (DTS) WITH DDC 7-9 SMART DIGITAL PUMP	GRUNDFOS	CONTRACTOR	2
CI-102	CHLORINE INJECTOR	SODIUM HYPOCHLORITE INJECTION SYSTEM, GRUNDFOS DOSING TANK STATION (DTS) WITH DDC 7-9 SMART DIGITAL PUMP	GRUNDFOS	CONTRACTOR	2
TK-301	SETTLING/CLARIFIER TANK	ROLL-OFF SETTLING-CLARIFIER TANK, 8,000 GAL CAPACITY	GWTT, INC.	CONTRACTOR	4
P-112A/B	Pump	REPLACE EXISITNG 5.375 INCH IMPELLER WITH 6.062 INCH IMPELLER	ITT GOULDS	CONTRACTOR	5
P-212A/B	Pump	REPLACE EXISITNG 5.375 INCH IMPELLER WITH 6.062 INCH IMPELLER	ITT GOULDS	CONTRACTOR	5

REMARKS:

1. SAND FILTERS WILL BE SHIPPED ON INTEGRAL SKID. CONTRACTOR SHALL INSTALL SKIDS PER DRAWINGS. ANY SHIP-LOOSE ITEMS SHALL BE INSTALLED BE
2. EQUIPMENT SHALL BE INSTALLED PER MANUFACTURER'S RECOMMENDATIONS AND/OR AS SHOWN ON DRAWINGS.
3. LIFTING AND RIGGING OF EQUIPMENT SHALL BE IN ACCORDANCE WITH SPECIFIED PROCEDURES.
4. ROLL-OFF TO ACCOMMODATE PICKUP WITH HEIL LOWLIFT™ EQUIPPED TRUCK.
5. ITT GOULDS PUMP MODEL 3196STI 2X3-6

INFLUENT DISTRIBUTION VALVE OPERATION



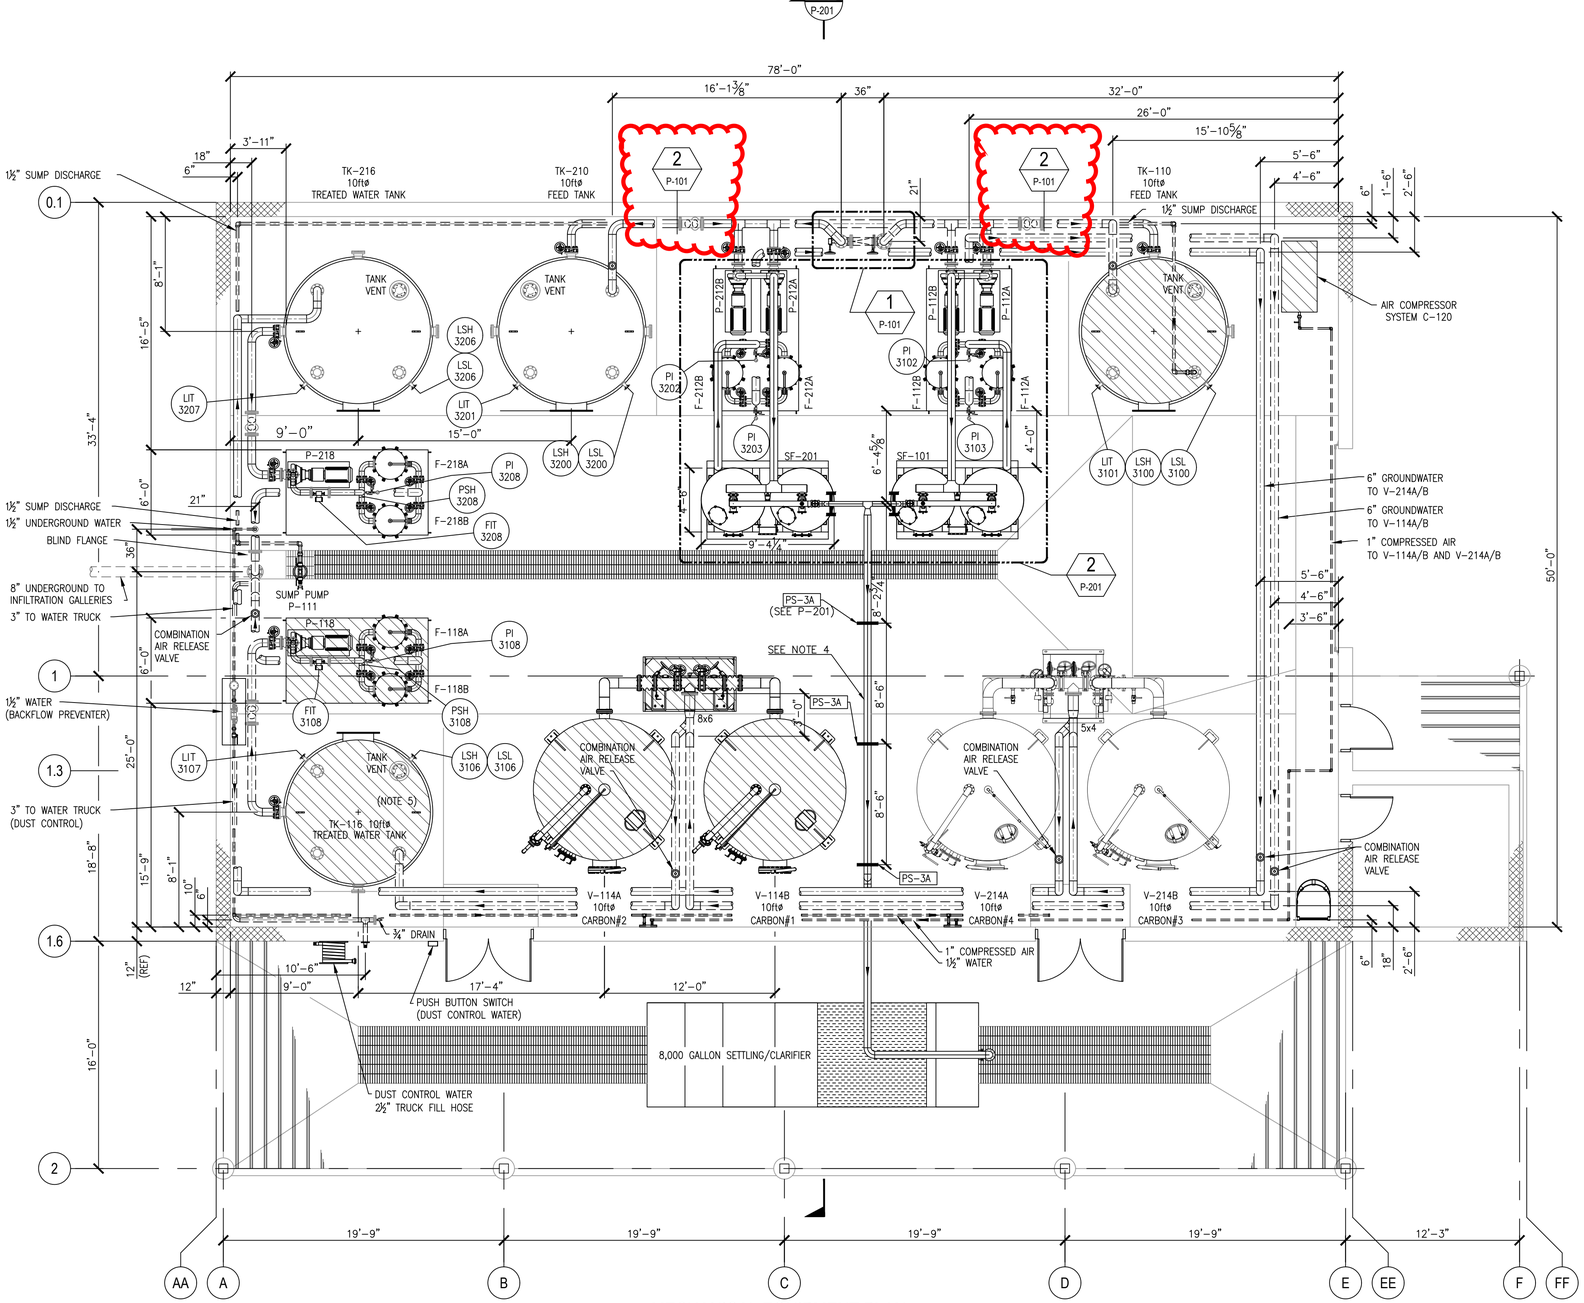


FIGURE 1

INFLUENT FROM THE EXTRACTION WELLS ENTERS THE TREATMENT PLANT VIA EITHER A 4 INCH OR 8 INCH GROUNDWATER INFLUENT LINE CONNECTED TO THE DISTRIBUTION MANIFOLD. THIS MANIFOLD PRESENTLY HAS 6 BUTTERFLY VALVES NUMBERED 1-6 AND ONE STRAINER AS SHOWN IN FIGURE 1. THE 4 INCH LINE, HAVING BUTTERFLY VALVES 1, 3, AND 5 IS CONNECTED TO THE EXPANSION TREATMENT TRAIN (TANK, FEED PUMPS, BAG FILTERS, GAC, AND TREATED WATER TANK). THE 8 INCH LINE, HAVING BUTTERFLY VALVES 2, 4, AND 6, IS CONNECTED TO THE INITIAL TREATMENT TRAIN (TANK, FEED PUMPS, BAG FILTERS, GAC, AND TREATED WATER TANK). WATER FROM THE MANIFOLD FLOWS UNDER PRESSURE FROM THE EXTRACTION WELLS THROUGH THE DISTRIBUTION MANIFOLD TO THE FEED TANKS. UPON ENTERING THE FEED TANKS INTERNAL PRESSURE GOES TO ATMOSPHERIC. THE SUCTION LINE FROM THE INITIAL FEED TANK CONNECTS TO THE INITIAL SKID FEED PUMPS. THE SUCTION LINE FROM THE EXPANSION FEED TAN

NOTES:

1. EXISTING EQUIPMENT IS SHOWN HATCHED:
2. EXISTING PIPING IS SHOWN DASHED:
3. ALL EQUIPMENT SHALL BE INSTALLED AND ANCHORED PER CB&I PHASE IV MID-PLUME PUMP AND TREAT SYSTEM STRUCTURAL DRAWINGS AND MANUFACTURER'S RECOMMENDATIONS.
4. LOCATE BACKWASH LINE AT MIDPOINT BETWEEN BAR JOISTS. FIELD VERIFY.

ELECTRICAL NOTES

GENERAL ELECTRICAL NOTES

1. ALL WORK SHALL BE PERFORMED IN ACCORDANCE WITH THE FOLLOWING REQUIREMENTS AND THE DETAILS WHETHER OR NOT THEY ARE REFERENCED ON THE DRAWINGS.
2. CONDUIT AND WIRING DIAGRAMS, QUANTITIES, AND SIZE OF WIRES AND CONDUITS REPRESENT A SUGGESTED ARRANGEMENT BASED UPON SELECTED STANDARD COMPONENTS OF ELECTRICAL EQUIPMENT. MODIFICATIONS ACCEPTABLE TO THE ENGINEER MAY BE MADE BY THE CONTRACTOR TO ACCOMMODATE EQUIPMENT PURCHASED OR FOR A MORE APPROPRIATE INSTALLATION AS DETERMINED IN THE FIELD. THE SEQUENCE AND METHOD OF CONTROL MUST BE MAINTAINED AS INDICATED ON THE DRAWINGS AND SPECIFICATIONS.
3. THE ELECTRICAL CONTRACTOR SHALL VISIT THE SITE PRIOR TO BIDDING THE PROJECT TO VERIFY THE SCOPE OF WORK WITH FIELD CONDITIONS.
4. USE MANUFACTURER-APPROVED CABLE PULLING COMPOUND OR LUBRICANT WHERE NECESSARY; COMPOUND USED MUST NOT DETERIORATE CONDUCTOR OR INSULATION. DO NOT EXCEED MANUFACTURER' S RECOMMENDED MAXIMUM PULLING TENSIONS AND SIDEWALL PRESSURE VALUES. USE PULLING MEANS, INCLUDING FISH TAPE, CABLE, ROPE, AND BASKET-WEAVE WIRE/CABLE GRIPS THAT WILL NOT DAMAGE CABLES OR RACEWAY.
5. DO NOT INSTALL BRUISED, KINKED, SCORED, DEFORMED, OR ABRADED CABLE. DO NOT SPLICE CABLE BETWEEN TERMINATION, TAP, OR JUNCTION POINTS. REMOVE AND DISCARD CABLE IF DAMAGED DURING INSTALLATION AND REPLACE IT WITH NEW CABLE.
6. COLD-WEATHER INSTALLATION: BRING CABLE TO ROOM TEMPERATURE BEFORE DE-REELING. DO NOT USE HEAT LAMPS FOR HEATING.
7. FASTEN CABLES IN PLACE WITH HARDWARE SPECIFICALLY DESIGNED FOR THAT PURPOSE WITHOUT DAMAGING CABLES.
8. REMOVE ABANDONED CONDUCTORS AND CABLES. ABANDONED CONDUCTORS AND CABLES ARE THOSE INSTALLED THAT ARE NOT TERMINATED AT EQUIPMENT AND ARE NOT IDENTIFIED FOR FUTURE USE WITH A TAG.
9. WHEREVER CONTACT WITH CONCRETE OR DISSIMILAR METALS CAN PRODUCE GALVANIC CORROSION OF EQUIPMENT, SUITABLE INSULATING MEANS SHALL BE PROVIDED TO PREVENT SUCH CORROSION.
10. CONDUCTORS, EQUIPMENT, AND ACCESSORIES THAT ARE SIMILAR IN APPLICATION (E.G. LOW-VOLTAGE CABLES, CIRCUIT BREAKERS, OR MOUNTING EQUIPMENT) SHALL BE OBTAINED THROUGH ONE SOURCE FROM A SINGLE MANUFACTURER.

CONDUIT

1. CONDUITS, TUBING, AND FITTINGS SHALL BE LISTED AND LABELED AS DEFINED IN NFPA 70, BY A QUALIFIED TESTING AGENCY, AND MARKED FOR INTENDED LOCATION AND APPLICATION.
2. UNLESS NOTED OTHERWISE ON DRAWINGS OR DETAILS, EXPOSED CONDUIT ABOVEGROUND SHALL BE RIGID GALVANIZED STEEL EXCEPT FOR CONNECTIONS BETWEEN RIGID CONDUIT AND MOTOR TERMINAL BOXES OR SIMILAR EQUIPMENT SUBJECT TO VIBRATION, WHICH SHALL BE FLEXIBLE LIQUID-TIGHT CONDUIT. EXPOSED CONDUIT UNDERGROUND SHALL BE PVC.
3. CONDUIT SHALL BE TERMINATED SO AS TO PERMIT NEAT CONNECTION TO MOTORS AND OTHER EQUIPMENT.

LOW VOLTAGE CONDUCTORS AND CABLES

1. CONDUCTORS ARE TO COMPLY WITH NEMA WC 70/ICEA S-95-658.
2. CONDUCTORS SHALL BE COPPER AND RATED FOR 600 VAC. ALUMINUM CONDUCTORS ARE NOT PERMITTED UNLESS INDICATED OTHERWISE ON PROJECT DRAWINGS.
3. INSULATION SHALL BEAR THE UL LABEL, MANUFACTURER'S TRADEMARK, INSULATION TYPE, VOLTAGE, AND CONDUCTOR SIZE.
4. WHERE POSSIBLE, CONCEAL CABLES IN FINISHED WALLS, CEILINGS, AND FLOORS UNLESS OTHERWISE INDICATED.
5. CONDUCTORS SHALL BE RUN CONTINUOUSLY FROM POINT-TO-POINT WITHOUT SPLICES.
6. CONDUCTORS SHALL NOT BE PULLED INTO RACEWAY UNTIL IT HAS BEEN CLEARED OF MOISTURE AND DEBRIS.
7. FEEDER CIRCUITS SHALL BE COPPER, STRANDED AND A MINIMUM #12 AWG. FEEDERS INDOORS IN DRY ENVIRONMENT SHALL BE TYPE THWN/THHN, SINGLE CONDUCTORS IN RACEWAY. FEEDERS OUTDOORS OR IN WET ENVIRONMENT SHALL BE TYPE THWN-2 OR XHHW-2, SINGLE CONDUCTORS IN RACEWAY. FEEDERS CONCEALED IN CONCRETE, BELOW SLABS-ON-GRADE, AND UNDERGROUND SHALL BE TYPE XHHW-2, SINGLE CONDUCTORS IN RACEWAY.
8. CLASS 1 REMOTE CONTROL AND SIGNAL CIRCUITS SHALL BE STRANDED COPPER, TYPE THHN/THWN, MINIMUM CONDUCTOR SIZE OF #14 AWG, IN RACEWAY, COMPLYING WITH UL 83.
9. CLASS 2 LOW ENERGY, REMOTE CONTROL AND SIGNAL CIRCUITS SHALL BE STRANDED COPPER, TYPE THHN/THWN, MINIMUM CONDUCTOR SIZE OF #16 AWG, IN RACEWAY, COMPLYING WITH UL 83.
10. CLASS 3 LOW ENERGY, REMOTE CONTROL, ALARM AND SIGNAL CIRCUITS SHALL BE STRANDED COPPER, TYPE THHN/THWN, TW, OR TF. MINIMUM CONDUCTOR SIZE OF #12 AWG, IN RACEWAY, COMPLYING WITH UL 83.
11. TERMINATE ALL LOW VOLTAGE CONTROL CONDUCTORS; NO CABLE SHALL CONTAIN UN-TERMINATED ELEMENTS. MAKE TERMINATIONS ONLY AT INDICATED OUTLETS, TERMINALS, AND CROSS-CONNECT AND PATCH PANELS. UTILIZE SPARE TERMINALS AS NECESSARY FOR TERMINATION OF SPARE CONDUCTORS.
12. SHIELDED INSTRUMENTATION CABLES SHALL BE GROUNDED ONLY ON THE CONTROL PANEL OR PLC SIDE OF A 4-20 MA CIRCUIT.
13. SECURE AND SUPPORT CABLES AT INTERVALS NOT EXCEEDING 30 INCHES AND NOT MORE THAN 6 INCHES FROM CABINETS, BOXES, FITTINGS, OUTLETS, RACKS, FRAMES, AND TERMINALS.
14. BUNDLE, LACE, AND TRAIN CONDUCTORS TO TERMINAL POINTS WITHOUT EXCEEDING MANUFACTURER'S LIMITATIONS ON BENDING RADII.

RE: LETTER REPORT SODIUM HYPOCHLORITE GENERATOR INSTALLATION; BULK FUELS FACILITY PROJECT, ALBUQUERQUE, NEW MEXICO

Dear Ms. Cordova,

EA Engineering, Science, and Technology Inc., PBC (EA) has completed the installation of the sodium hypochlorite generator within the groundwater treatment facility located on Kirtland Air Force Base (AFB), New Mexico. This letter report is to document the completion of the installation, shakedown, and acceptance of the system by EA personnel from EA's subcontractors. Historical submittal packages for the sodium hypochlorite generator and supporting materials are included in Attachment A.

SYSTEM INSTALLATION

The sodium hypochlorite generator installation began with the delivery and inspection of the MIOX Vault 25, brine tank, oxidant tank, and water softener on 23AUG18. Installation of the various system components was completed between 27AUG18 and 28SEP18. Daily activity summary reports, field forms, and photographs are provided in Attachment B.

SYSTEM SHAKEDOWN

System shakedown was performed between 20SEP18 and 28SEP18. Shakedown included training on system operation, initial startup, and commissioning of the system on 20SEP18, followed by a weeklong observation period over which the system was monitored daily to assess performance. Testing documentation is provided in Attachment C.

FINAL WALKTHROUGH, PUNCH LIST, AND ACCEPTANCE

The final walkthrough, identification of punch list items, and acceptance by USACE occurred on 05OCT18. The following two punch list items were requested during the final walkthrough:

1) Installation of caution tape onto drain lines
2) Tidying of excess communication cable at the dosing pumps

Both punch list items were completed on 17OCT18. Final record drawings of the installation are provided in Attachment D. The warranty for the MIOX Vault 25 is provided in Attachment E.

If you have any questions or need additional information, please do not hesitate to call me at (505) 715-4248.

Sincerely,

Devon E. Jercinovic, PG, PMP
Project Manager

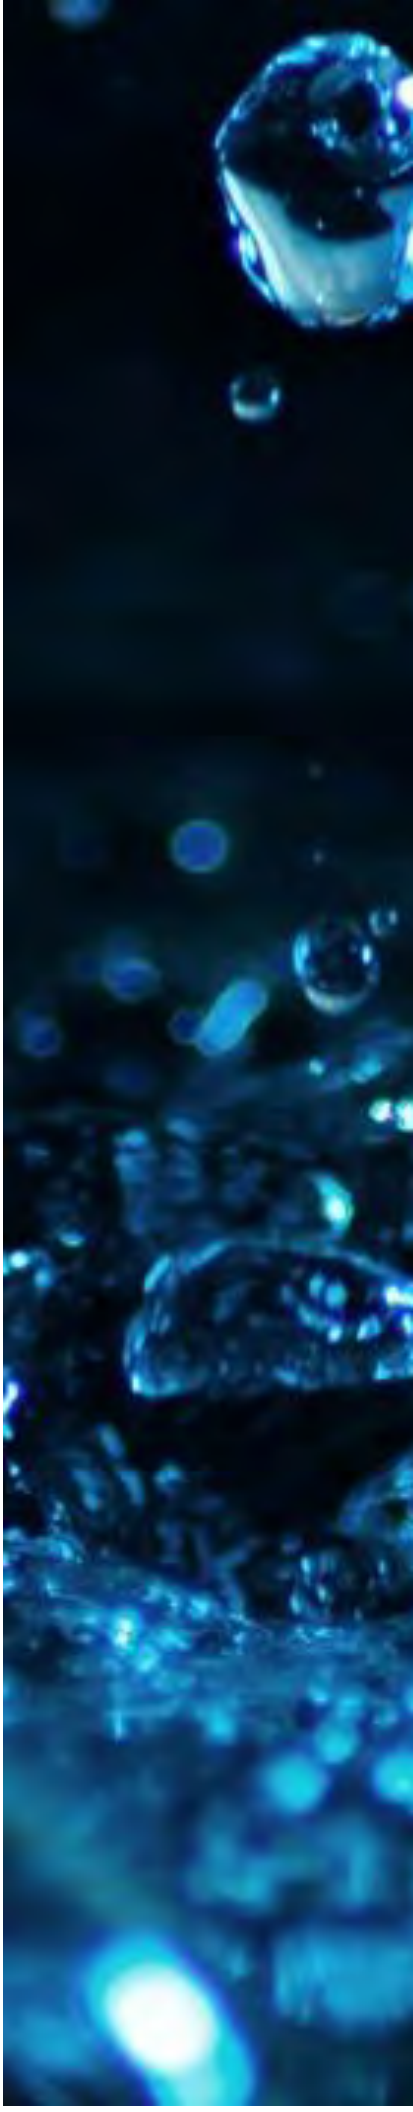
Item No.	No. Copies	Description	Manufacturer	Mfg/Vendor Dwg or Detail	Action Taken*
1	1	Sodium hypochlorite generator and fittings	MIOX and Others	See Attached	**A**

The Action Designated Above is in Accordance with the Following Legend:

A – Furnish as Submitted
B – Furnish as Noted
C – Revise and Re-submit
1. Not enough information for review.
2. No reproducible submitted.
3. Copies illegible.
4. Not enough copies submitted.
5. Wrong sequence number.
6. Wrong resubmittal number.
7. Wrong Spec. Section.
8. Wrong form used.
9. See Comments.

D – Rejected
E – Engineer's Review not Required
1. Submittal not required.
2. Supplemental Information. Submittal retained for Information purposes only.
3. Information reviewed and approved on prior submittal.
4. See Comments.

Review is for general compliance with Contract Documents. No responsibility is assumed for correctness of dimensions or detail. Contractor is required to specify deviations from contract requirements. Lack of exceptions noted by Engineer does not waive Contractor's obligation to comply with Drawings and Specifications.



Comments:
Items reviewed and confirmed to meet requirements
Issues in Bold

Sodium hypochlorite generator exceeds minimum production requirements and fittings are comprised of materials compatible with influent and effluent solutions.

MIOX STANDARD TERMS AND CONDITIONS OF PURCHASE AND WARRANTY INFORMATION

PAGE LEFT BLANK ON PURPOSE

MIOX Terms & Conditions of Purchase 08/01/2012

1. ACCEPTANCE: The terms and conditions contained herein constitute the sole terms and conditions governing the purchase by the buyer ("Buyer") stated on the face hereof of the equipment and other items specified on the face hereof ("Equipment"). Buyer shall be deemed to have accepted and agreed to these Terms and Conditions by its receipt of the Equipment or placement of a purchase order. Any terms and conditions different from or in addition to those contained herein, including any contained in Buyer's purchase order or in any other document furnished by Buyer, shall be of no force or effect in connection with the sale of the Equipment and MIOX hereby objects to and rejects in their entirety all such terms and conditions, as MIOX's agreement to sell the Equipment is expressly made conditional upon the use of these Terms and Conditions. No variation to these terms, nor any other terms and conditions by you, shall be of any effect unless such variation or terms are expressly accepted in writing, signed on behalf of MIOX.

2. TRANSPORTATION: For domestic shipments, the terms are F.O.B. MIOX dock, unless the quotation provides otherwise. For international shipments, the terms are EXW MIOX dock, unless the quotation provides otherwise. In either situation, all freight charges and other shipping costs shall be paid by Buyer. MIOX prices do not include freight charges and other shipping costs. Shipping of Equipment returned to MIOX shall be at Buyer's expense.

3. RISK OF LOSS: For domestic shipments, the risk of loss or damage to Equipment in transit shall be upon Buyer, with title to Equipment transferring to Buyer at point when the Equipment is at the disposal of the Buyer. For international shipments, risk of loss and damage shall pass to the Buyer at the point when the Equipment is at the disposal of the Buyer. Title shall pass to the Buyer only when MIOX has received payment in full.

4. RELEASE OF OBLIGATION: No payment, whether final or otherwise, shall operate to release Buyer from any obligations arising as a result of this order. Orders cannot be cancelled by Buyer without MIOX written consent, and then only upon terms that will compensate MIOX for lost profits and all costs and expenses (including any engineering and/or fabrications charges) applicable to the cancelled order.

5. INDEMNITY: Buyer shall defend and indemnify MIOX against all damages, liabilities, claims, losses, and expenses (including, without limitation, reasonable attorney's fees) arising out of or resulting in any way from any act or omission of Buyer, its agents, employees or subcontractors.

6. BUYER'S INSOLVENCY: If Buyer becomes bankrupt or insolvent, or if a petition in bankruptcy or insolvency is filed against Buyer, or if a receiver, trustee, or assignee for the benefit of creditors is appointed for Buyer, MIOX shall have the right, at its sole election, to treat such occurrence as a breach hereof.

7. REMEDIES: In the event of a breach of any one or more of the provisions of this order, MIOX shall have all the rights available to it at law and equity including, but not limited to, (a) to retain any money paid up to an amount which MIOX determines is adequate to cover all damages resulting from Buyer's breach, (b) to assert any claim for damages and any expenses whatsoever, including, without limitation, reasonable attorney's fees, which may be incurred by MIOX by reason of such breach, and (c) to terminate this order immediately upon written notice to Buyer. Such rights shall be in addition to any other remedies provided herein or provided by law or in equity, such remedies to be cumulative and not alternative.

8. PROPRIETARY INFORMATION: Any specifications, drawings, designs, manufacturing data or other information that may be transmitted to Buyer by MIOX in connection with this order are the property of MIOX and are disclosed in confidence upon the condition that they are not to be reproduced or copied or used in furnishing information or equipment to others, or for any purpose detrimental to the interest of MIOX. MIOX shall retain or be entitled to assignment of all intellectual property rights (including copyrights, trademark rights, patent rights, trade secret rights and mask work rights) in any items, features, adaptations, or modifications of Equipment.

9. WAIVER: No waiver by MIOX of any conditions appearing herein shall be deemed to constitute a waiver of any other conditions with regard to subsequent transactions or subsequent parts of the same transaction. No waiver of a breach of any provision of this order shall constitute a waiver of any other breach or of such provisions.

10. FORCE MAJEURE: In the event of a disruption of MIOX business in whole or in part by reason of governmental actions, acts of God, fires, strikes, floods, storms, earthquakes, epidemics, quarantines, wars, insurrections, riots, strikes, acts of civil or military authorities, transportation embargoes, shortages, wrecks, severe weather, labor shortages, computer viruses, other malware, or crashes, Buyer acts or omissions, deliveries of components and materials, or delays by MIOX suppliers, or other causes beyond MIOX's control, MIOX shall have the option of canceling delivered orders in whole or in part. If cancelled by MIOX, any deposits made in conjunction with such order shall be refunded in full to Buyer. Such cancellation shall not constitute a breach of these Terms and Conditions.

11. LICENSE: Subject to the terms and conditions provided in this Agreement, MIOX hereby grants to Customer a nonexclusive, non-sublicenseable, non-transferable license to use all patents, designs, trade secrets, copyrights, or trademarks applying to all Equipment manufactured by MIOX or its contractors either in whole or in part to the Buyer's specifications.

12. TERMS OF PAYMENT: Buyer shall be responsible for payment to MIOX, in full, of the amount invoiced, by pre-payment, or C.O.D., unless credit terms are agreed to in writing and signed by MIOX prior to shipment. If MIOX has granted credit terms to in writing and signed by MIOX prior to shipment.

If MIOX has granted credit terms to the Buyer, all payments must be made on or before the stipulated date unless otherwise agreed to in writing. Failure to pay on or before said date shall constitute a breach of this order,

12 (continued), and MIOX may in addition to all other remedies;

a. Require Buyer pay interest at a rate of 18% per annum, or at the maximum legal rate if lower.
b. Suspend any further or other deliveries under any contact with Buyer.

MIOX reserves the right to change terms of payment and discontinue further shipments without prejudice to any other lawful remedy until past due payments are made, or if MIOX, in its sole discretion, deems Buyer to be non-credit worthy. MIOX prices for the Equipment are exclusive of all sales, use, excise and similar taxes and duties and any such taxes and duties shall be the sole responsibility of Buyer.

13. RETURNS: No Equipment will be accepted for return without the prior written approval of MIOX. Buyer shall pay a restocking fee equal to twenty-five percent (25%) of the purchase price for any Equipment accepted for return.

14. INSPECTION AND DEFICIENT PARTS: All inspection or re-inspection performed by Buyer is at Buyer's own expense. Claims for defective material or workmanship, or for missing material, must be submitted to MIOX within fourteen days of receipt of Equipment by Buyer, and must be verified by an authorized agent of MIOX. In such cases, MIOX liability is limited to the replacement or repair of such part or parts as MIOX may decide. Shipping of parts returned as deficient shall be done at Buyer's expense

15. HEADINGS: Headings are inserted for convenience only. In the event any provision of these Terms and Conditions is not enforceable, such unenforceability does not affect the remainder of this order, as the remainder of this order shall remain in full force and effect.

16. APPLICABLE LAW: These Terms and Conditions shall be governed by and shall be construed according to the laws of the State of New Mexico.

17. WARRANTY: MIOX warrants that the MIOX Products when properly installed and operated in accordance with MIOX Products' Operation Manual, will work in accordance with the Technical Specifications and any other specifications defined in the Agreement. This warranty is non-transferrable.

MIOX warrants the MIOX Products against any defects in design, workmanship or material in accordance with the following conditions:

Any defective MIOX Products ("the Defective Product") will be repaired or replaced by MIOX in accordance with the following warranty conditions:

The warranty period varies based on the item and product and is as follows:

a) All On-Site Generator Enclosures will be warranted for two (2) years starting from the date of shipment from MIOX. Only for the RIO Zuni, the integrated brine tank is considered a part of the enclosure.
b) All Cells excluding the RIO Zuni Cells will be warranted for five (5) years starting from the date of shipment from MIOX. The RIO Zuni Cell is warrantied for two (2) years starting from the date of shipment from MIOX.
c) Peripherals and MIOX Products Spare Parts (excluding Cells) will be warranted for one (1) year from the date of shipment from MIOX or by the supplying manufacturer's warranty, whichever is greater.

The warranty shall be void if the MIOX Products, Peripherals or MIOX Products Spare Parts:

d) have been modified without the express written authorization of MIOX; or
e) have been damaged, improperly used or subjected to an adverse operating environment, outside of their intended uses and/or environment; or
f) are repaired or modified by anyone other than MIOX approved personnel; or
g) have been used in a manner contrary to the MIOX Products Operation Manual or other written instructions provided by MIOX, including but not limited to performing below specification or damaged due to contamination caused by, but not limited to, calcium, manganese, magnesium and insolubles.

THIS WARRANTY IS EXPRESSLY IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OR MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, AND/OR ANY OTHER OBLIGATION OR LIABILITY ON THE PART OF MIOX. The sole and exclusive remedy for breach of any warranty, express or implied, and the only obligation of MIOX thereunder, shall be the repair or replacement of defective products or, at MIOX's sole option, refund of the purchase price or substitution with a new replacement product. MIOX shall in no way be responsible for any consequential damages, of any kind or nature whatsoever, resulting from the breach of any warranty, express or implied.

18. LIMITATION OF LIABILITY. IN NO EVENT SHALL THE LIABILITY OF MIOX HEREUNDER, WHETHER FOR BREACH OF WARRANTY OR CONTRACT, TORT (INCLUDING NEGLIGENCE), PATENT, COPYRIGHT OR OTHER INFRINGEMENT OR OTHERWISE, EXCEED THE PURCHASE PRICE OF THE EQUIPMENT OR PART OR COMPONENT THEREOF WHICH ALLEGEDLY CAUSED THE DAMAGE. IN NO EVENT SHALL MIOX HAVE ANY LIABILITY FOR SPECIAL, INDIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES.

19. NON-ASSIGNMENT. Buyer shall not assign any of its rights or obligations hereunder.

20. ENTIRE AGREEMENT. These Terms and Conditions, the provisions on the face hereof and any other documents incorporated by reference on the face hereof are the sole and exclusive statement of the agreement between the parties concerning the purchase and sale of the Equipment and supersede any prior agreements, orders, quotations, demonstration, samples, proposals or understandings in connection therewith. These Terms and Conditions may only be amended, modified, waived or revoked by a written instrument executed by both parties hereto.

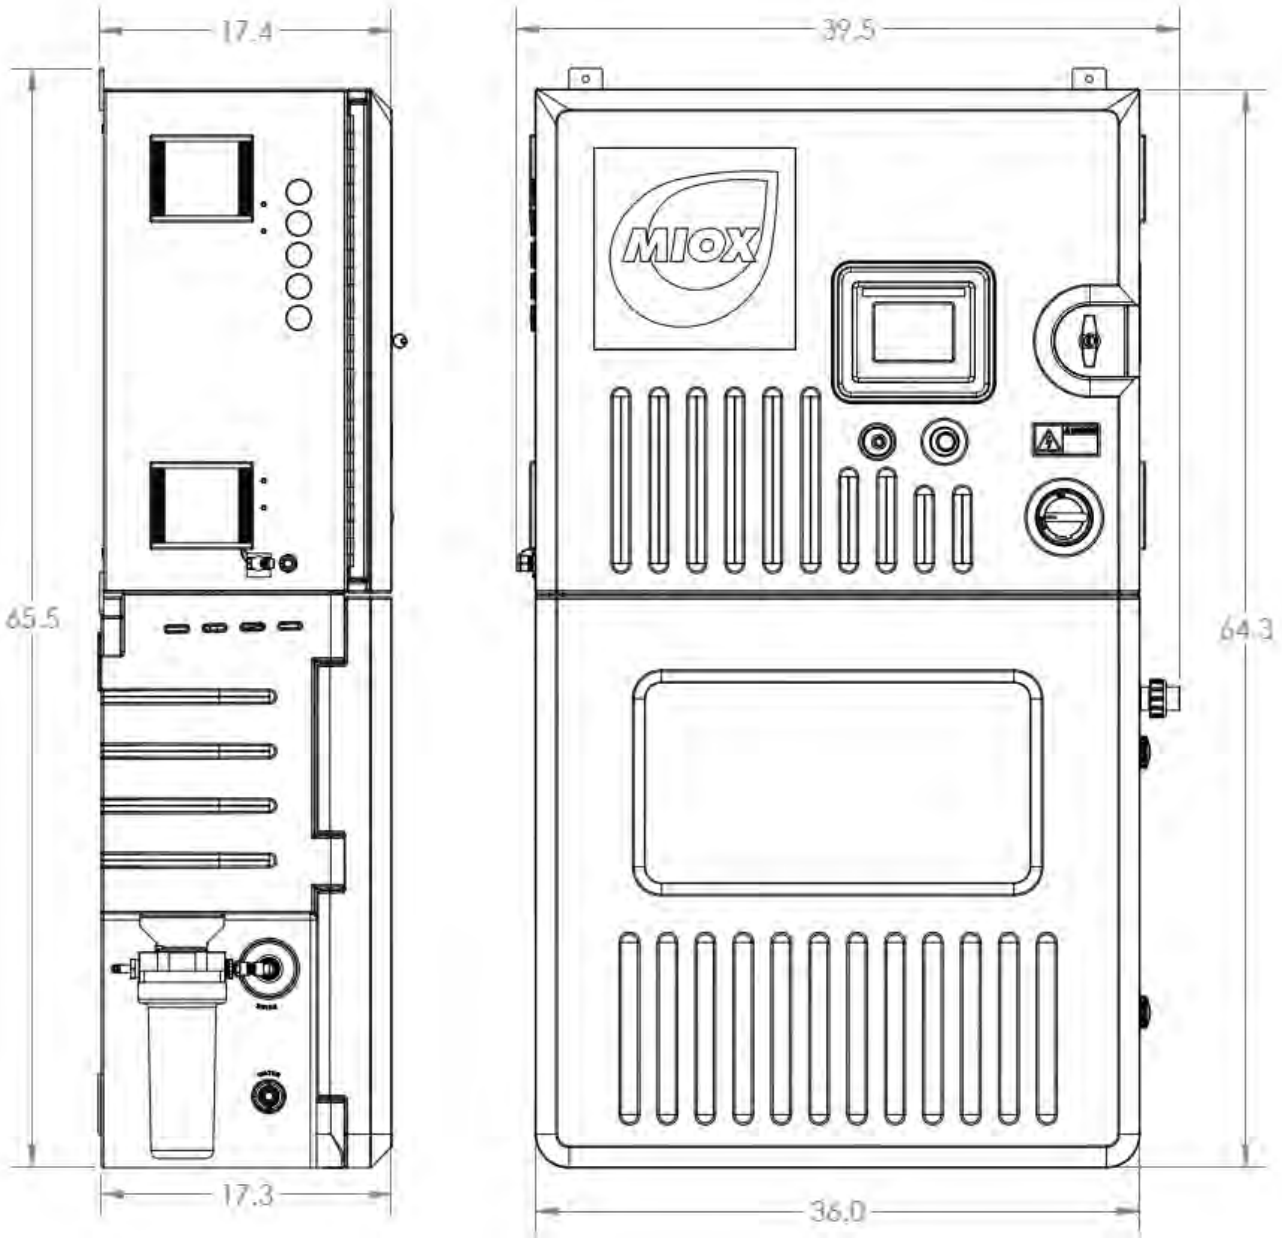
Vault™ Standard HYPO Specifications



The MIOX Vault™ on-site generator is designed for high efficiency, low lifecycle cost, durability and reliability. The Vault standard hypo configuration features self-adjusting flow control and an easy-to-upgrade cell to convert between sodium hypochlorite and advanced mixed oxidant. Expandable capacity offers ultimate flexibility. With over 40% improved salt and energy efficiencies, the Vault is built for cost-effective operation. Using just salt and power to generate a dilute chlorine-based solution eliminates the storage and handling of hazardous disinfection chemicals while providing chlorine residual.

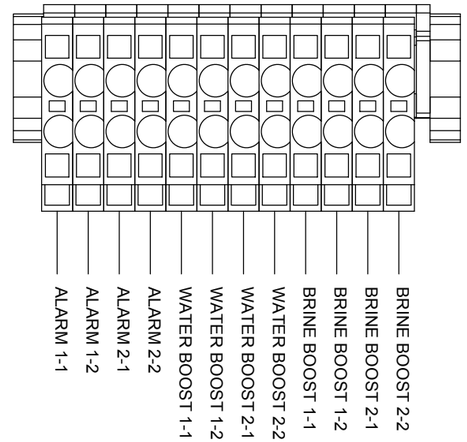
AUXILIARY POWER CONN



THE AUXILIARY POWER CONNECTOR PROVIDES FIELD CONNECTION POINTS TO SUPPLY POWER FOR A HYDROGEN DETECTOR OR TO PROVIDE 24V POWER TO AUXILARY RELAYS. CURRENT IS LIMITED TO 1 AMP AND IS FUSED INTERNALLY.

CONNECTION NAME	CONNECTION DESCRIPTION
+24V DC	24 VOLTS DC POWER
24V RETURN	RETURN CONNECTION FOR 24VDC POWER
PE	PHYSICAL EARTH CONNECTION

AUXILIARY RELAY CONN

THE AUXILIARY RELAY CONNECTOR PROVIDES FIELD CONNECTION POINTS FOR THE AUXILIARY RELAY CONTACTS. THERE ARE THREE AUXILIARY RELAYS: ALARM, WATER BOOST AND BRINE BOOST. EACH RELAY HAS TWO SETS OF NORMALLY OPEN CONTACTS. THE RELAY CONTACTS ARE RATED FOR 277V AC @ 15 AMPS OR 28 V DC @15 AMPS.

CONNECTION NAME	CONNECTION DESCRIPTION
ALARM	CONTACT CLOSE WHEN SYSTEM SHUTS DOWN FOR A HARD FAULT
WATER BOOST	CONTACTS CLOSE WHEN SYSTEM STARS UP (RUNNING)
BRINE BOOST	CONTACTS CLOSE WHEN SYSTEM STARTS UP (RUNNING)

PROPRIETARY AND CONFIDENTIAL
THIS DRAWING AND DESIGN IS THE PROPERTY OF MIOX CORPORATION. IT MAY NOT BE USED FOR ANY PURPOSE OTHER THAN BY THE OWNER. MIOX CORPORATION DOES NOT AUTHORIZE THE REPRODUCTION OR CONVEYANCE OF ANY INFORMATION CONTAINED HEREIN.

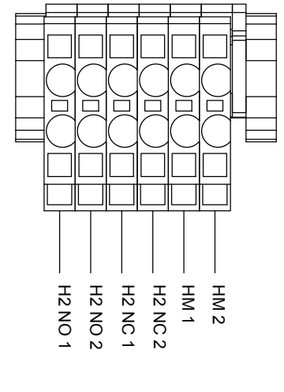
DILUTION AIR CONN



THE AUXILIARY RELAY CONNECTOR PROVIDES FIELD CONNECTION POINTS FOR AN AUXILIARY DILUTION AIR SYSTEM AND/OR ASSOCIATED EXTERNAL DILUTION AIR SYSTEM SENSORS. THE CONNECTIONS SUPPORTED ARE MIOX EXTERNAL DILUTION AIR SYSTEM ENABLE AND MIOX EXTERNAL DILUTION AIR SYSTEM FAILURE INPUT. TWO OTHER FAILURE INPUTS CAN BE CONNECTED TO EXTERNAL DIFFERENTIAL PRESSURE SWITCHES OR AN EXTERNAL FLOW SWITCH.

CONNECTION NAME	CONNECTION DESCRIPTION
DAE +24V DC	24V DC, ENABLE FOR MIOX EXTERNAL DA SYSTEM, TURNS ON AT START UP
DAE RETURN	RETURN FOR ENABLE
DAS FAIL 1-1	FAILURE INPUT (24V DC OK -OVER DC FAIL)
DAS FAIL 1-2	POS +24V DC (SOURCE OF FAILURE INPUT 1)
DAS FAIL 2-1	FAILURE INPUT (24V DC OK -OVER DC FAIL)
DAS FAIL 2-2	POS +24V DC (SOURCE OF FAILURE INPUT 2)
DAS FAIL 3-1	FAILURE INPUT (24V DC OK -OVER DC FAIL)
DAS FAIL 3-2	POS +24V DC (SOURCE OF FAILURE INPUT 3)

H2 / HARDNESS CONN

THE H2 / HARDNESS CONNECTOR PROVIDES FIELD CONNECTION POINTS FOR AN EXTERNAL HARDNESS MONITOR AND/OR AN EXTERNAL HYDROGEN MONITOR. THE HYDROGEN MONITOR INPUTS REQUIRE BOTH NORMALLY CLOSED AND NORMALLY OPEN CONTACTS. THE HARDNESS MONITOR INPUT ONLY REQUIRES NORMALLY CLOSED DRY CONTRCTS.

CONNECTION NAME	CONNECTION DESCRIPTION
H2 NO 1	NORMALLY OPEN INPUTS
H2 NO 2	NORMALLY OPEN INPUTS
H2 NC 1	NORMALLY CLOSED INPUTS
H2 NC 2	NORMALLY CLOSED INPUTS
HM 1	HARDNESS MONITOR INPUT
HM 2	+24V DC SOURCE OF HRDS MON INPUT

PROPRIETARY AND CONFIDENTIAL

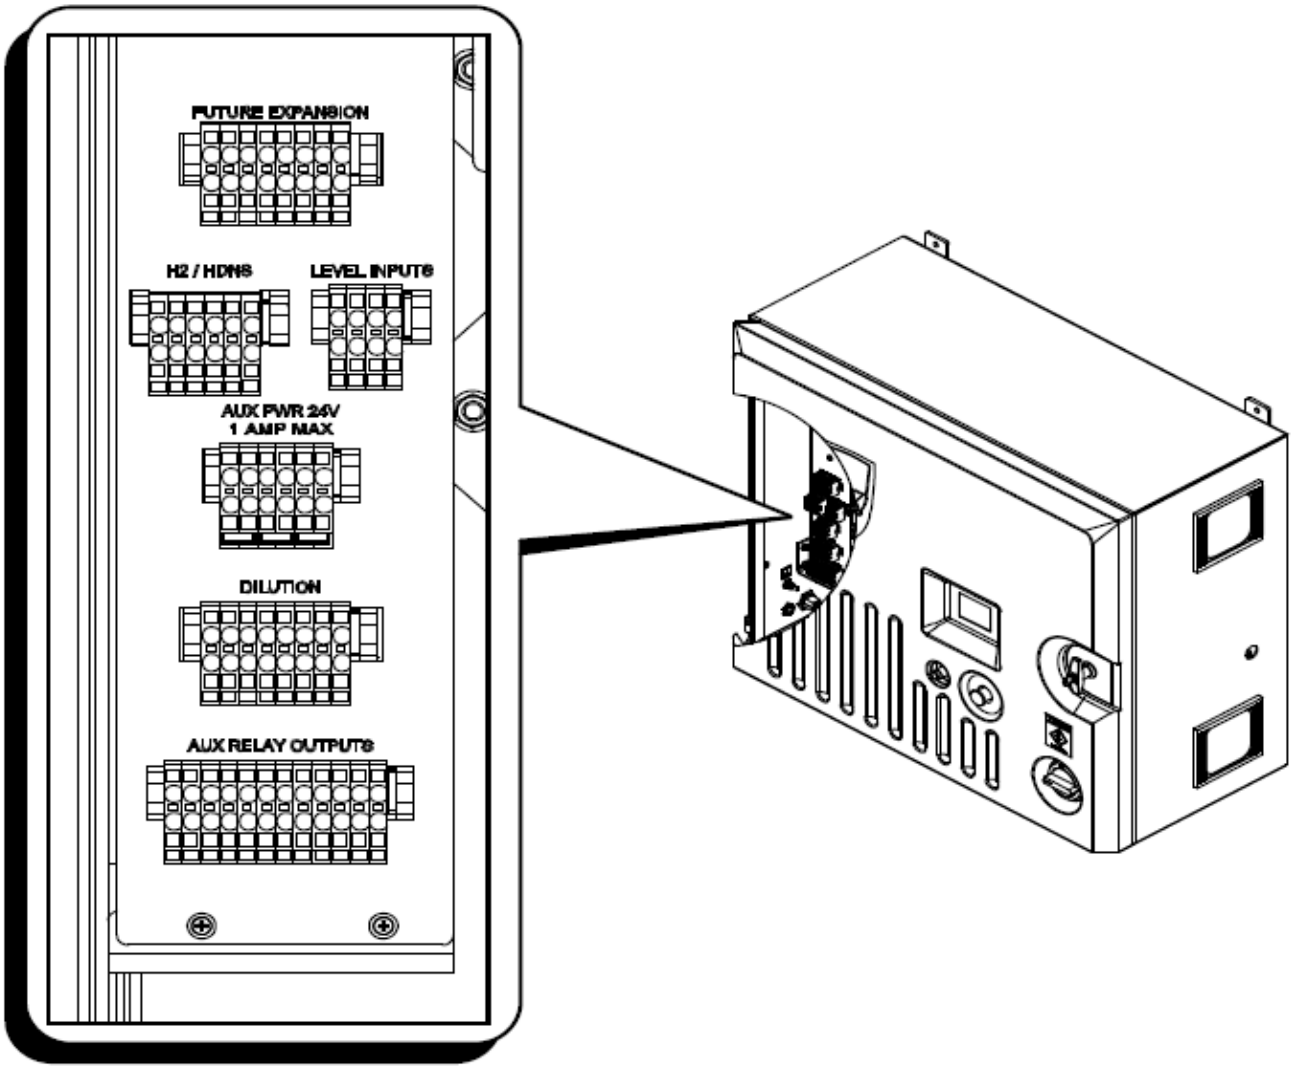
PAGE LEFT BLANK ON PURPOSE

VAULT Controls



The VAULT Series on-site generator cabinet houses the Process Controller, Operator Interface, Ethernet Interface, and I/O Interface Module.

The VAULT Series PLC is an Allen Bradley MicroLogix 1400 Programmable Logic Controller with a 4-Channel Analog Input card included. The control enclosure is located in the upper cabinet behind the color touch-screen interface. The power supply for this equipment is also located in the upper cabinet and all is accessible by opening the hinged enclosure door.

If multiple OSG's are to be used in a single installation, various operating configurations are possible. Individual OSG's can be selected for alternating operation by using the touch-screen interface.

Main Display Screen (Example for documentation purposes only)

Rear Panel Connections

MicroLogix 1400

Small Programmable Logic Controller

Allen-Bradley

Features and Benefits

- Expand your application capabilities with up to 7 expansion I/O modules for a maximum of 256 discrete I/O
- Up to 6 embedded 100 kHz highspeed counters (on controllers with dc inputs)
- 2 Serial ports with DF1/ DH485/ Modbus RTU/DNP3/ASCII protocol support
- Ethernet port provides you with EtherNet/IP, DNP3 over IP and Modbus TCP/IP protocol support as well as web server and email capabilities
- Built-in LCD with backlight allows you to view controller and I/O status, and provides a simple interface for messages, bit / integer monitoring and manipulation

Product Description

The Allen-Bradley® MicroLogix™ 1400 from Rockwell Automation complements the existing MicroLogix family of small programmable logic controllers. MicroLogix 1400 combines the features you demand from MicroLogix 1100, such as EtherNet/IP, online editing, and a built-in LCD, plus provides you with enhanced features, such as: higher I/O count, faster High Speed Counter/PTO and enhanced network capabilities

Take advantage of the built-in LCD with back lighting to set the Ethernet network configuration, display floating point values on a user configurable display, display OEM logos at startup and read or write any binary, integer and long file elements in the data table.

Three embedded communication ports provide you with excellent communications capabilities. MicroLogix 1400 offers an isolated RS232C/ RS485 combination port; a non-isolated RS232C port; and an RJ-45 port for 10/100 Mbps EtherNet/IP peer-to-peer messaging, DNP3 over IP and Modbus TCP/IP protocol.

Similar to the rest of the MicroLogix family, MicroLogix 1400 is programmed with RSLogix 500 programming software (Version 8.1 and above) as well as RSLogix Micro programming software.

Product Specifications

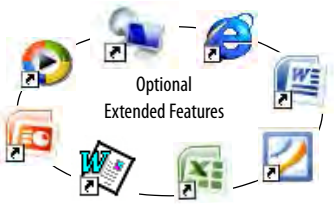
PanelView Plus 6 - 400 and 600 Terminals

The next generation PanelView Plus 6 - 400 and 600 terminals combine the display, logic, communication, and power into one base unit:



- The 400 model has a 3.5-in. color graphic display with keypad or combination key and touch input, or a grayscale display with keypad input.
- The 600 model has a 5.7-in. color or grayscale graphic display with keypad, touch screen, or combination keypad/touch-screen input.

For a complete listing of catalog number selections, refer to the Visualization Solutions Selection Guide, publication VIEW-SG001.

This new generation of terminals runs Windows CE 6.0 operating system similar to the 700...1500 terminals. The terminals run HMI applications but they also provide the ability to access the desktop. For users with more complex application requirements, the 600 color terminals can be ordered with optional, extended features and file viewers.

Table 6 - Terminal Features

Features	Description
High memory capacity	256 MB RAM, 512 MB nonvolatile memory (approx. 73 MB free user memory)
Power input	AC or DC
Communication ports	Units are available with one of these communication options: • RS-232 • Ethernet and RS-232 Separate communication modules are not supported.
USB ports	• 1 USB host ports for connecting a USB mouse, keyboard, printer, and USB flash drives that are hot swappable • 1 USB device port for connecting a host personal computer
Secure Digital (SD) card slot	Hot-swappable card slot supports 1784-SD*x* SD cards for transferring files, upgrading firmware, or logging data
Operating system 	All terminals run the Windows CE 6.0 operating system (OS) providing OS functionality that is needed for most users needs: • FTP server • VNC client/server • PDF reader • Active X controls • Third-party device support Additional functionality is available for the 600 terminals by ordering terminals with these optional, extended features: • Internet Explorer web browser • Media player • Microsoft file viewers for PowerPoint, Excel, and Word • WordPad text editor
FactoryTalk View software	• FactoryTalk View Machine Edition runtime, version 6.10 or later, is preloaded and activated on each terminal • HMI applications are developed with FactoryTalk View Studio for Machine Edition software, which is purchased separately
Reset and default switches	Provide easy access to diagnostic and repair operations

Technical Specifications

Table 7 provides technical specifications for PanelView Plus 6 - 400 and 600 terminals.

Touch:— —		Keypad: 167 x 266 x 68 mm (6.58 x 10.47 x 2.68 in.) 167 x 266 x 98 mm (6.58 x 10.47 x 3.86 in.) Touch: 152 x 185 x 68 mm (6.0 x 7.28 x 2.68 in.) 152 x 185 x 98 mm (6.0 x 7.28 x 3.86 in.)	
Cutout dimensions (HxW)	Keypad: 123 x 156 mm (4.86 x 6.15 in.) Touch: —		Keypad: 142 x 241 mm (5.61 x 9.50 in.) Touch:123 x 156 mm (4.86 x 6.15 in.)	

(1) Replace *x* in the catalog number with an 8 or 9. For catalog numbers ending in 9, for example, 2711P-T6C20D9, the Windows CE operating system includes extended features and Microsoft Office file viewers; catalog numbers ending in 8, for example, cat. not. 2711P-T6C20D8, do not support extended features and file viewers.

Terminal Dimensions

Table 8 provides overall dimensions and cutout dimensions for the PanelView Plus 6 - 400 and 600 terminals.

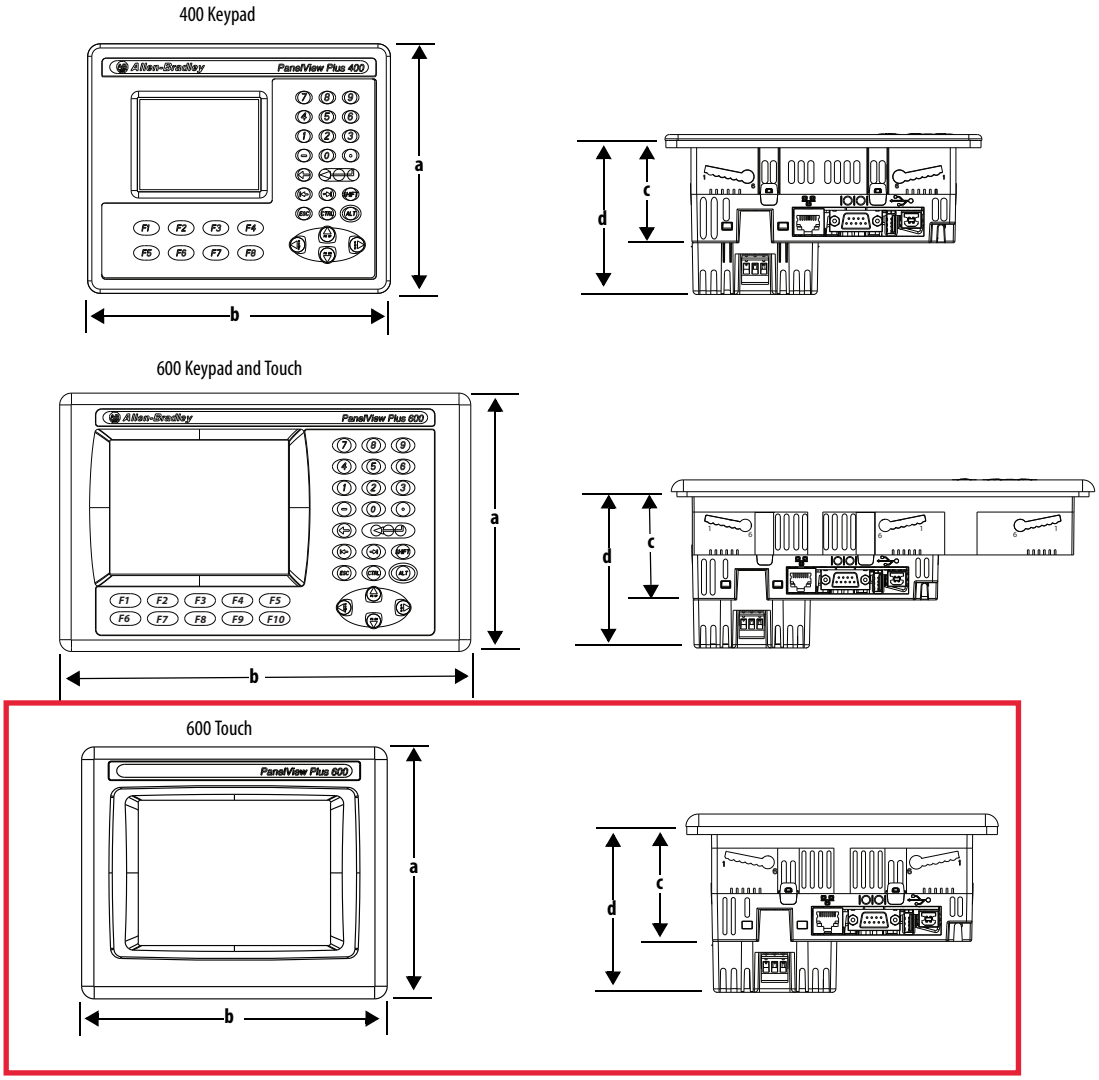

Table 8 - PanelView Plus 6 - 400 and 600 Product Dimensions

Terminal	Input Type	Height (a) mm (in.)	Width (b) mm (in.)	Depth (c) mm (in.)	Depth (d) with AC module mm (in.)	Panel Cutout Width mm (in.)	Panel Cutout Height mm (in.)
400	Keypad or keypad/touch	152 (6.0)	185 (7.28)	60 (2.35)	90 (3.54)	156 (6.15)	123 (4.86)
600	Keypad or keypad/touch	167 (6.58)	266 (10.47)	68 (2.68)	98 (3.86)	241 (9.50)	142 (5.61)
	Touch	152 (6.0)	185 (7.28)	68 (2.68)	98 (3.86)	156 (6.15)	123 (4.86)

Additional Resources

These documents contain additional information concerning related products from Rockwell Automation.

Resource	Description
Visualization Solutions Selection Guide, publication VIEW-SG001	Provides an overview of the visualization products, and includes catalog number selections offered by Rockwell Automation.
PanelView 6 Terminals User Manual, publication 2711P-UM006	Provides information on how to install, configure, operate, and troubleshoot the PanelView Plus 6 (400, 600, 700, 1000, 1250, 1500) terminals.
PanelView Plus 6 Compact Terminals User Manual, publication 2711PC-UM002	Provides information on how to install, configure, operate, and troubleshoot the PanelView Plus 6 Compact terminals.
Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1	Provides general guidelines for installing a Rockwell Automation® industrial system.
Product Certifications website, http://www.ab.com	Provides declarations of conformity, certificates, and other certification details.

The SAFEST WATER In The World

VAULT System Status Parameters

All VAULT systems provide an Ethernet interface to Plant control systems through the Red Lion modular controller interface.

The interface is designed for **monitoring** of the VAULT system status **only**.

The following system parameters can be read from the following memory locations:

PARAMETER	DATA TYPE	RANGE OR STATUS
CELL CURRENT	ANALOG	0-999.9
CELL VOLTAGE	ANALOG	0-99.9
BRINE PUMP VOLTS	ANALOG	0-4.999
SYSTEM HOURS	ANALOG	0-999999.9
WATER PRESSURE	ANALOG	0-999.9
CELL HOURS	ANALOG	0-999999.9
WATER TEMPERATURE	ANALOG	0-999.9
OXIDANT TEMPERATURE	ANALOG	0-999.9
OPERATION WINDOW	ANALOG	1=OP WINDOW
UPPER LEVEL SWITCH	DIGITAL	0= UP; 1= DOWN
LOWER LEVEL SWITCH	DIGITAL	0= UP; 1= DOWN
WATER PRESSURE SWITCH	DIGITAL	0= NOT OK; 1 = OK

Soft Fault – The system shuts down if a soft fault condition is present and will return to function normally without manual intervention when the soft fault input returns to the non-fault state. Exception- the Run/Stop switch must be manually operated.

The following soft fault conditions can be monitored remotely:

Soft Fault Type	Cause
Run/Stop	Run/Stop switch is in the Stop position
Oxidant Tank Full	Tank is full
Undefined Tank Level Inputs	Tank level inputs are invalid inspect float operation and connections.

5601 Balloon Fiesta Parkway, Albuquerque, NM 87113 I 1690 Sumneytown Pike, Suite 150, Lansdale, PA 19446
P: 505-343-0090 888-646-9420 F: 505-343-0093 E: info@miox.com W: www.miox.com www.twitter.com/miox

Hard Fault – The system shuts down if a hard fault condition occurs and will require manual intervention (power cycle) to reset the fault.

The following soft fault conditions can be monitored remotely:

Hard Fault Type	Cause
Low Cell Current	Cell current is inadequate
Rupture Disk Failure	Rupture disk burst
Very High Cell Current	Current reached an excessive level
Low Cell Voltage	Cell voltage is inadequate
Very High Ox Temp	Oxidant temperature is too high
High Brine Pump Voltage	Pump is providing too much brine
Low Pump Voltage	Pump cannot meet demand for brine
Low Water Pressure	Inlet water pressure is inadequate
Low Feed Water Temp	Inlet water temperature is too low
Cell Current Variation	Current imbalance exists in cell
Hardness Monitor	Optional External Hardness Monitor indicates softener failure.
Hydrogen Monitor	Optional External Hydrogen Monitor indicates Hydrogen in sensor area
Dilution Air Failure	Optional External DA system shows a failure
High Water Pressure	Inlet water pressure is too high
Low Feed Water Flow Rate	Feed water flow rate is inadequate
High Feed Water Flow Rate	Feed water flow rate is too high

MIOX VAULT OSG to SCADA COMMUNICATIONS - MODBUS TCP/IP DETAILS

The MIOX Vault OSG system parameters are being transferred via Modbus TCP/IP to a remote device.
The remote device is expected to be able to receive Modbus data in the form of word, long and real data types.

AB Micrologix 1400 PLC Attributes:

PLC Version Compatibility: 3.2.0 and higher

Driver: Modbus TCP/IP Slave

IP Address:	Configurable/Site provided
Mask:	Configurable/Site provided
Gateway:	Configurable/Site provided

Driver Settings
TCP Port: 502
Session Limit: 2

Data Format: All variables are provided in the format of integer. Floating point numbers are multiplied by a base 10 scaling factor, where applicable, to maintain resolution. The received integers will need to be divided but the appropriate value to accurately receive the floating point number.

Please note: Modbus is an open communications standard. Given the many different manufacturers of equipment, the flexibility to interpret and create variations upon the standard makes providing a 'one size fits all configuration', difficult.

Sequence of commands to remotely control Vault OSG.

1. Local Vault OSG:
    a. Place system in Remote mode from front panel display. (Network configuration page).
        i. 40013 will become 1.
    b. Enable Watchdog (Network configuration-Change Settings page).
        i. 00016 will become 1.
2. Remote SCADA:
    a. Place a 1 in 00000 (REMOTE START STOP) to start system.
    b. The register 00032 (WATCHDOG RESET) must be toggled at least every ~5 seconds, otherwise the system will soft fault and shut down.
    c. The heartbeat value is readable at 40004.
    d. The watchdog can also be enabled remotely by placing a 1 in 00016 (WATCH DOG ENABLE).
    e. Remote SCADA: Place a 0 in 00000 (REMOTE START STOP) to stop system.

PAGE LEFT BLANK ON PURPOSE

The SAFEST WATER In The World

VAULT Electrolytic Cell

The VAULT MIOX electrolytic cell is a proprietary membraneless electrolytic cell manufactured by MIOX Corporation that produces sodium hypochlorite. Cell housings for the VAULT series cells are constructed from clear Acrylic. The VAULT series electrolytic cells operate on 30 VDC.

Each electrolytic cell is fully enclosed in machined Acrylic plastic. Electrode plates are constructed of titanium with a proprietary catalytic coating. A diluted brine solution is fed at the bottom of the cell and the sodium hypochlorite is withdrawn from cell exit port at the top of the electrolytic cell.

The MIOX Corporation sodium hypochlorite cell does not produce disinfectant in a batch process. Rather it uses a continuous generation process that delivers a steady stream of disinfectant solution to the storage tank until the on-site generation system receives a signal from the solution tank level switch that the tank is full. When the solution tank low level switch is activated, the on-site generator is reactivated delivering a steady stream of sodium hypochlorite to the solution day tank.

For safety reasons, gas volume in the electrolytic cell is minimized by a rectangular cell design, and each electrolytic cell is housed in a corrosion resistant plastic enclosure. Cell leads are equipped with guards to protect and isolate the operator from accidental shock. Cells are pressure tested to 25 psi.

5601 Balloon Fiesta Parkway, Albuquerque, NM 87113 I 1690 Sumneytown Pike, Suite 150, Lansdale, PA 19446
P: 505-343-0090 888-646-9420 F: 505-343-0093 E: info@miox.com W: www.miox.com www.twitter.com/miox

PAGE LEFT BLANK ON PURPOSE

The feed water connection to the VAULT™ Series OSG comes from the water softener. For optimal efficiency, the recommended feed water temperature range is from 55F to 80F (12-27°C). The allowable feed water temperature range is from 40F to 95F (5-35°C). Feed water temperature must be within the allowable range to avoid damage to the electrolytic cell. The feed water connection is ½" Schedule 80 PVC union. A ¾" Y-strainer is provided in the Operations Kit that must be installed on the inlet plumbing prior to entering into the pluming box. Two ¾" x ½" reducer bushings are also provided to make proper connections with ½" pipe, or maintain ¾" pipe inlet to Y-strainer inlet (site specific). Refer to Figure 11 for details on water inlet connection. Before connecting the water supply to the OSG, flush water through the softener until the water is clean and clear making sure no pipe shavings enter the plumbing manifold.

IPEX RV Sediment Strainers protect critical pipeline components by removing solids and suspended impurities. Clear PVC construction allows for inspection of the screen while in service, whereas the bottom-entry design permits maintenance on the valve while in-line. This Y-pattern strainer is also available in Corzan® CPVC. RV RV Sediment Strainers are part of our complete systems of pipe, valves, and fittings, engineered and manufactured to our strict quality, performance, and dimensional standards.

Valve Availability

Body Material:	PVC, CPVC
Size Range:	1/2" through 4"
Pressure:	232 psi (1/2" to 1"), 150 psi (1-1/4" to 2"), 60 psi (3" to 4")
Seals:	EPDM, or Viton® (FPM)
End Connections:	Socket (IPS), Threaded (FNPT), Flanged (ANSI 150)

RV Series Sediment Strainers

Sample Specification

1.0 Sediment Strainers - RV

1.1 Material

- The valve body, end connectors, and unions shall be made of PVC compound which shall meet or exceed the requirements of cell classification 12454 according to ASTM D1784.

or The valve body, end connectors, and unions shall be made of Corzan® CPVC compound which shall meet or exceed the requirements of 23447 according to ASTM D1784.

- These compounds shall comply with standards that are equivalent to NSF Standard 61 for potable water.

1.2 Seals

- The o-ring seals shall be made of EPDM which shall comply with standards that are equivalent to NSF Standard 61 for potable water.

or The o-ring seals shall be made of Viton® (FPM) which shall comply with standards that are equivalent to NSF Standard 61 for potable water.

1.3 Mesh Screen

- The mesh screen shall be made of PVC compound which shall meet or exceed the requirements of cell classification 12454 according to ASTM D1784.

or The mesh screen shall be made of stabilized PP homopolymer compound, also containing a RAL 7032 pigment, which shall meet or exceed the requirements of Type I Polypropylene according to ASTM D4101-86.

or The mesh screen shall be made of corrosion resistand 304 stainless steel.

1.4 All other wetted and non-wetted parts of the valves shall comply with standards that are equivalent to NSF Standard 61 for potable water.

2.0 Connections

2.1 Socket style

- The IPS socket PVC end connectors shall conform to the dimensional standards ASTM D2466 and ASTM D2467.

or The IPS socket CPVC end connectors shall conform to the dimensional standard ASTM F439.

2.2 Threaded style

- The female NPT threaded PVC end connectors shall conform to the dimensional standards ASTM D2464, ASTM F1498, and ANSI B1.20.1

or The female NPT threaded CPVC end connectors shall conform to the dimensional standards ASTM F437, ASTM F1498, and ANSI B1.20.1.

RV Series Sediment Strainers

Sample Specification (cont'd)

2.3 Flanged style

- The ANSI 150 flanged PVC end connectors shall conform to the dimensional standard ANSI B16.5.

or The ANSI 150 flanged CPVC end connectors shall conform to the dimensional standard ANSI B16.5

3.0 Design Features

- Strainers shall be Y-pattern in style.
- Sizes 1/2" through 2" shall have true union ends.
- Sizes 3" and 4" shall have solid threaded or socket ends.
- It shall be possible to service the valve without removing it from the line.
- PVC strainers shall have a transparent body for evaluation of filter screen condition.
- The filter screens shall be available in ASTM 18, 30, 35, and 50 mesh sizes.

3.1 Pressure Rating

- PVC valve sizes 1/2" through 1" shall be rated at 232 psi at 73°F.
- CPVC valve sizes 1/2" through 2" shall be rated at 232 psi at 73°F.
- PVC valve sizes 1-1/4" through 2" shall be rated at 150 psi at 73°F
- PVC valve sizes 3" through 4" shall be rated at 60 psi at 73°F.
- All sizes of flanged valves shall be rated at no greater than 150 psi at 73°F.

3.2 Markings

- All valves shall be marked to indicate size, material designation, and manufacturers name or trade mark.

3.3 Color Coding

- All PVC valves shall have transparent bodies with end connections color-coded dark gray.

or All CPVC valves shall be color-coded light gray.

4.0 All valves shall be Xirtec® 140 or Corzan® by IPEX or approved equal.

pressure – temperature ratings

RV Series Sediment Strainers

Technical Data (cont'd)

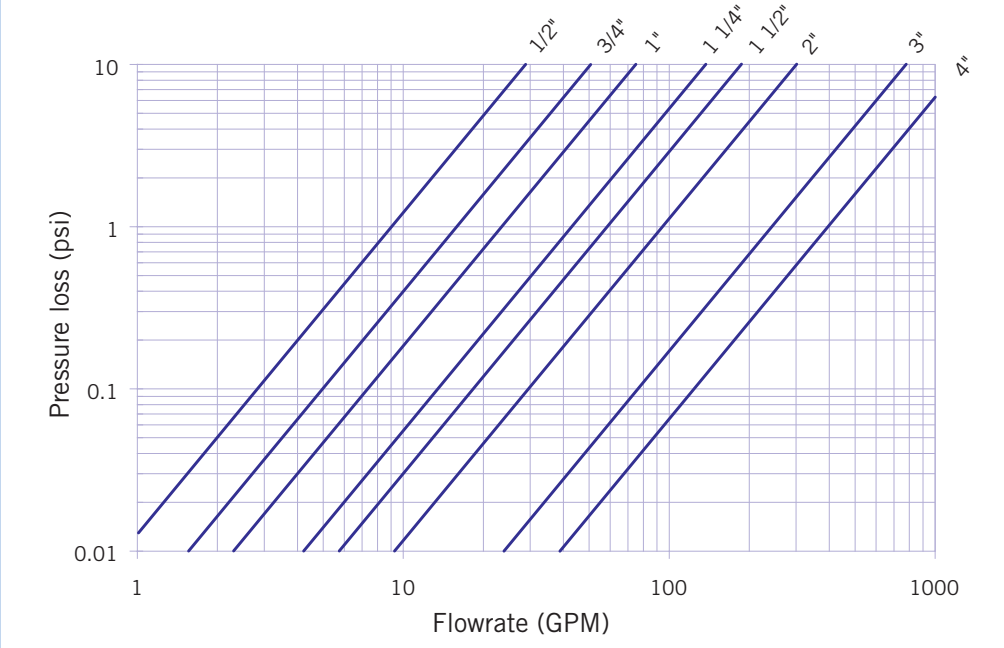
flow coefficients

The flow coefficient (C_V) represents the flow rate in gallons per minute (GPM) at 68°F for which there is a 1 psi pressure drop across the valve in the fully open position. These values are determined from an industry standard testing procedure which uses water as the flowing media (specific gravity of 1.0). To determine specific flow rate and pressure loss scenarios, one can use the following formula:

$$f = sg \times \left(\frac{Q}{C_V}\right)^2$$

Where,

f is the pressure drop (friction loss) in psi,



sg is the specific gravity of the fluid,

Q is the flow rate in GPM,

C_V is the flow coefficient.

Size	C_V
1/2	2.80
3/4	4.90
1	7.21
1-1/4	13.2
1-1/2	17.9
2	28.7
3	73.5

RV Series Sediment Strainers

Installation Procedures

True Union Style

1. For socket and threaded style connections, remove the union nuts (part #11 on previous pages) and slide them onto the pipe. For flanged connections, remove the union nut / flange assemblies from the valve.
2. Please refer to the appropriate connection style sub-section:
   a. For socket style, solvent cement the end connectors (10) onto the pipe ends. For correct joining procedure, please refer to the section entitled, *"Joining Methods – Solvent Cementing"* in the IPEX Industrial Technical Manual Series, *"Volume I: Vinyl Process Piping Systems"*. **Be sure to allow sufficient cure time before continuing with the valve installation.**
   b. For threaded style, thread the end connectors (10) onto the pipe ends. For correct joining procedure, please refer to the section entitled, *"Joining Methods – Threading"* in the IPEX Industrial Technical Manual Series, *"Volume I: Vinyl Process Piping Systems"*.
   c. For flanged style, join the union nut / flange assemblies to the pipe flanges. For correct joining procedure, please refer to the section entitled, *"Joining Methods – Flanging"* in the IPEX Industrial Technical Manual Series, *"Volume I: Vinyl Process Piping Systems"*.
3. Ensure that the valve is in the correct orientation (the bonnet should be suspended in a downward direction), and that the socket o-rings (9) are properly fitted in their grooves. Carefully place the valve in the system between the two end connections.
4. Tighten both union nuts and the lock nut (7). Hand tightening is typically sufficient to maintain a seal for the maximum working pressure. **Over-tightening may damage the threads on the valve body and/or the nut, and may even cause the nut to crack.**

Non True Union Style

2. Please refer to the appropriate connection style sub-section:
   a. For socket style, ensure that the valve is in the correct orientation (the bonnet should be suspended in a downward direction) then solvent cement the end connections of the valve body (1) to the pipe ends. For correct joining procedure, please refer to the section entitled, "Joining Methods – Solvent Cementing" in the IPEX Industrial Technical Manual Series, "Volume I: Vinyl Process Piping Systems". **Ensure that no excess solvent runs into the body as this would cause severe damage to internal components and render the strainer inoperative. Be sure to allow sufficient cure time before continuing with the valve installation.**
   b. For threaded style, ensure that the valve is in the correct orientation (the bonnet should be suspended in a downward direction) then thread the pipe ends into the valve body (1). For correct joining procedure, please refer to the section entitled, *"Joining Methods – Threading"* in the IPEX Industrial Technical Manual Series, *"Volume I: Vinyl Process Piping Systems"*.
   c. For flanged style, ensure that the valve is in the correct orientation (the bonnet should be suspended in a downward direction) then join to the pipe flanges. For correct joining procedure, please refer to the section entitled, *"Joining Methods – Flanging"* in the IPEX Industrial Technical Manual Series, *"Volume I: Vinyl Process Piping Systems"*.
3. Ensure that the bonnet (3, size 3") or lock nut (7, size 4") is sufficiently tightened. Hand tightening is typically sufficient to maintain a seal for the maximum working pressure. **Over-tightening may damage the threads on the valve body and/or the nut, and may even cause the nut to crack.**

RV Series Sediment Strainers

Valve Maintenance

disassembly

1. If removing the valve from an operating system, isolate the valve from the rest of the system. **Be sure to depressurize and drain the isolated branch and valve before continuing.**
2. For true union style, loosen both union nuts (11) and drop the valve out of the line. If retaining the socket o-rings (9), take care that they are not lost when removing the valve from the line.
3. For sizes 1/2" through 2" and 4":
   a. Loosen the lock nut (7) – bonnet (3) assembly and remove from the valve body (1).
   b. Remove the split ring (8) to separate the lock nut from the bonnet.
   c. Remove the retaining ring (6) and slide the screen mesh (2) out of the screen support (4).
   d. Remove the o-ring seal(s) (5) from the bonnet.
4. For size 3":
   a. Loosen the bonnet (3) and remove from the valve body (1).
   b. Remove the retaining ring (6) and slide the screen mesh (2) out of the screen support (4).
   c. Remove the o-ring seal(s) (5) from the groove on the valve body.
5. The valve components can now be checked for problems and/or replaced.

assembly

Note: Before assembling the valve components, it is advisable to lubricate the o-rings with a water soluble lubricant. **Be sure to consult the "IPEX Chemical Resistance Guide" and/or other trusted resources to determine specific lubricant-rubber compatibilities.**

1. For sizes 1/2" through 2" and 4":
   a. Properly fit the o-ring seal(s) (5) onto the bonnet (3).
   b. Insert the screen mesh (2) into the screen support (4) and fasten with the retaining ring (6).
   c. Place the lock nut (7) over the bonnet then fit the split ring (8) in the groove to lock in position.
   d. Insert the screen and lock nut – bonnet assembly into the valve body (1) and tighten.
2. For size 3":
   a. Properly fit the o-ring seal (5) onto the bonnet (1).
   b. Insert the screen mesh (2) into the screen support (4) and fasten with the retaining ring (6).
   c. Insert the screen assembly into the valve body.
   d. Tighten the bonnet (3) into the valve body.
3. For true union style, ensure that the socket o-rings (9) are properly fitted in their grooves, place the end connectors (10) into the union nuts (11), then tighten onto the valve body.

RV Series Sediment Strainers

Testing and Operating

The purpose of system testing is to assess the quality of all joints and fittings to ensure that they will withstand the design working pressure, plus a safety margin, without loss of pressure or fluid. Typically, the system will be tested and assessed in sub-sections as this allows for improved isolation and remediation of potential problems. With this in mind, the testing of a specific installed valve is achieved while carrying out a test of the overall system.

An onsite pressure test procedure is outlined in the IPEX Industrial Technical Manual Series, *"Volume I: Vinyl Process Piping Systems"* under the section entitled, *"Testing"*. The use of this procedure should be sufficient to assess the quality of a valve installation. **In any test or operating condition, it is important to never exceed the pressure rating of the lowest rated appurtenance in the system.**

Important points:

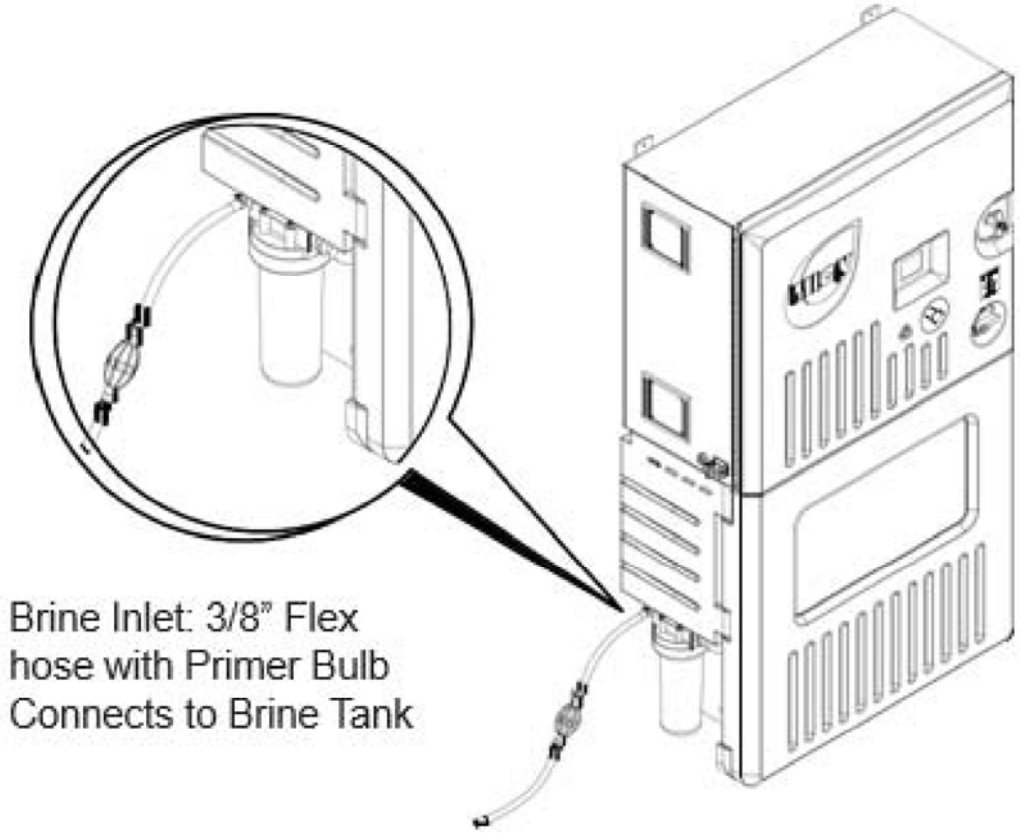
- Never test thermoplastic piping systems with compressed air or other gases including air-over-water boosters.
- When testing, do not exceed the rated maximum operating pressure of the valve.
- Avoid the rapid closure of valves to eliminate the possibility of water hammer which may cause damage to the pipeline or the valve.
- **To eliminate any possible damage to the filter screen, the design of the system should ensure that reverse flow conditions cannot occur.**
- **Transparent PVC strainers:**
  - **Allow light into the process flow facilitating the growth of micro-organisms.**
  - **Are not protected against UV radiation, reducing its lifetime in open air use.**
  - **Must be protected against vibrating stresses in proximity to pumping stations.**
- **Always check the cleanliness of the filtering screen.**

Please contact IPEX customer service and technical support with regard to any concern not addressed in this data sheet or the technical manual.

PAGE LEFT BLANK ON PURPOSE

Brine Feed Connection

The brine feed connection to the VAULT™ Series OSG is 3/8" tube with the appropriate adapter fitting. The OSG is equipped with a 3/8" barb fitting on the inlet of the brine filter assembly. Connection to the barb fitting is made with 3/8" ID x 5/8" OD flexible clear tubing supplied in the operations kit. A primer bulb is also included in the operations kit and should be placed in-line upstream of filter assembly but as close to the unit as possible. The primer bulb will aid in removing air bubbles for brine delivery to the cell. (Figure 12)



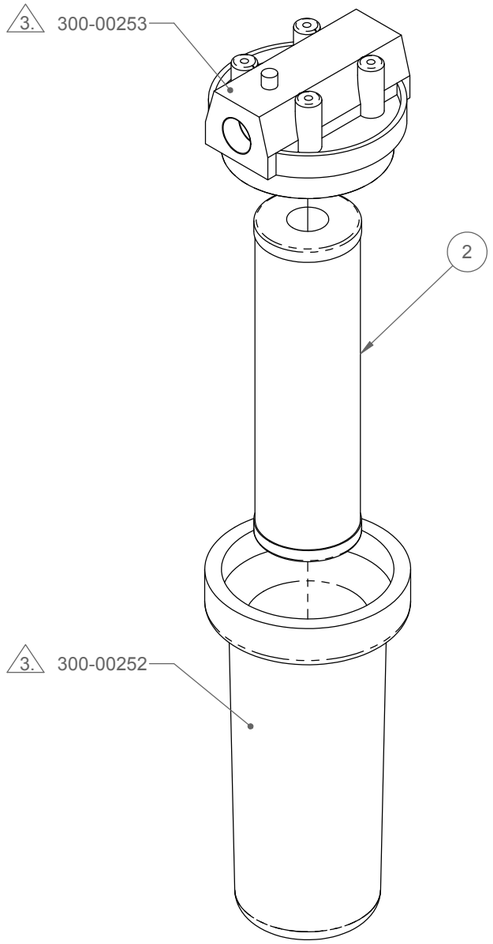


Figure 12 Brine Feed Connection

Note: On initial start-up, cell replacement or when brine plumbing connections are modified, air is introduced to the brine line. This air must be removed for proper operation of the brine pump. Air locks in the brine line will prohibit consistent brine flow to the cell.

FILTRATION
SYSTEMS

PENTEK® Standard

Filter Housings

Pentek Standard Filter Housings are manufactured with reinforced polypropylene housings have excellent chemical resistance and are ideal for many residential, commercial and industrial applications.

Standard Filter Housings are manufactured of a durable polypropylene or clear FDA-compliant Styrene-Acrylonitrile (SAN). All are equipped with 3/4" NPT inlet and outlet ports. Standard filter housings are available in both 10" and 20" lengths and will accommodate a wide range of 2-1/2" to 2-7/8" diameter cartridges.

The reinforced polypropylene cap and offers an optional pressure-relief button on the inlet side to relieve pressure inside the housing when changing filter cartridges.

Opaque Standard Filter Housings offer outstanding chemical compatibility and are ideal for use in a variety of low-flow applications. These applications include many residential, commercial and industrial filtration requirements.

Clear Standard Filter Housings offer on-site examination of flow, performance, and cartridge life. They are also ideal for a variety of applications.

Manufactured of clear, Styrene-Acrylonitrile (SAN), the sumps are annealed to relieve stress, adding clarity and strength.

Product Features

- Ideal for a wide range of applications, including residential, commercial and industrial
- Available in 10" and 20" lengths
- Optional pressure-relief/bleed button on inlet side of cap
- Thick walls for increased strength
- Leak-proof sealing with top-seated Buna-N o-ring
- Available with clear or opaque sumps

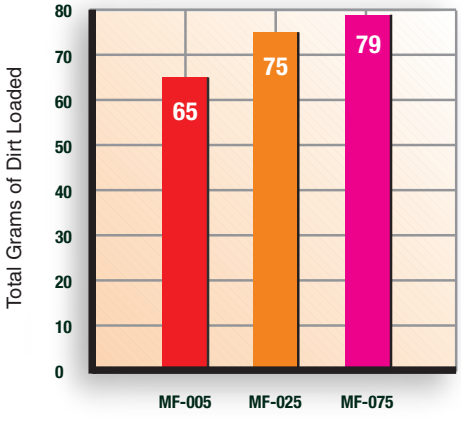
FILTER SPECIALISTS, INC.
Innovative Solutions. Clear Results.

The New Vorex
FILTER CARTRIDGE

The new and improved VOREX FILTER CARTRIDGE is designed for higher efficiency and fewer changeouts. The extensive research invested in the development of this filter has resulted in a superior filter cartridge that works better and lasts longer. The exclusive manufacturing process thermally bonds pure polypropylene microfibers. Lower density fibers are at the surface and sequentially higher density fibers are used toward the center, therefore particles are trapped more evenly throughout the entire cross section.



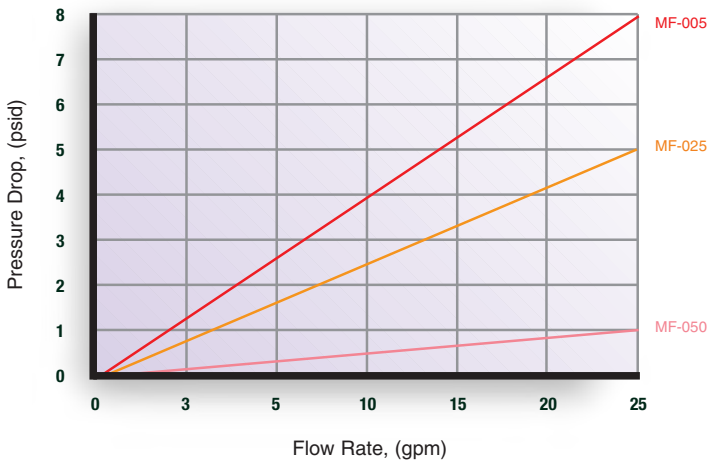
The Vorex is a nominally rated filter that works well as either a pre-filter or final filter in a wide range of applications including industrial, chemical process, food/beverage, cosmetics and water applications. *Meets FDA requirements.

Vorex
FILTER CARTRIDGE

The Vorex Advantage

- *Greater dirt holding—longer life*
- *Fewer filter changeouts*
- *No fiber migration*
- *100% polypropylene*
- *High flow rates with lower pressure drops*
- *Easy disposal (incinerates to non-volatile trace ash)*
- *Supports a wide range of industrial and chemical applications*
- *Very competitive economical pricing*

Dirt Holding Capacity



Many factors can influence cartridge life, like the type of solids loading, viscosity, etc,. For specific applications contact a FSI representative.

Vorex Filters trap contaminants throughout the entire cross section for improved dirt holding capacity and longer life.

Standard microfiber cartridges offer less volume for holding contaminants.

Clear Water Pressure Drop

This chart shows the Vorex filter cartridge life span as related to pressure drop. Results may vary in actual service.

Vorex Filter Cartridges

9.75", 10", 19.5", 19.75", 20", 29.25", 30", 39", 39.5", 40"
*Standard lengths listed. Custom lengths available.

I.D. 1.06" O.D. 2.5"

FDA Compliant, NSF Certified Materials The Vorex filter cartridge complies with the appropriate U.S. Food and Drug Administration guidelines, as outlined in the Code of Federal regulations,Title 21, Sections 177.1520 (a), (1) and Section 177.1520 (c), (1.1). This filter is certified by NSF International under ANSI/NSF Standard 42.

The Vorex filter cartridge meets the requirements of a USP Plastic Class VI as demonstrated by USP Biological Reactivity Tests, In Vivo.

There are no expressed or implied warranties given with respect to this product and/or claims of performance. All test results are conducted under standard industry conditions, and actual results may very based on specific applications.

Filter Specialists, Inc. is a leader in filtration products. FSI offers custom cartridge design and manufacturing.

Oxidant Discharge

The standard oxidant discharge connection from the VAULT™ Series OSG is 3/4" union which is provided to connect directly to the oxidant tank via the CPVC pipe. A 2" oxidant (CPVC) transfer pipe, ¾" check valve and ¾" 3-way valve (for sampling) should be included in the plumbing from OSG to Oxidant Tank.

⚠WARNING Do not use any valves in the mixed-oxidant or sodium hypochlorite lines other than the 3-way valve provided by MIOX. These valves have an open center configuration that prevents the blockage of flows from the cell. Failure to use MIOX supplied three-way valves may void the system and cell warranty.

Drain

The plumbing compartment is the only area in the OSG that has the potential for a water leak. The compartment is equipped with low point drains that will drain directly to the floor. The drain from this compartment should only flow in the event of a malfunction that will be evident from liquid underneath the enclosure. If this condition is noticed, immediately shut down the system, diagnose, and correct the leak.

PVC & CPVC TRUE UNION 2000 VALVES

TU2000-2-0605

One of the Most Versatile, Compact Valve Designs Available

Spears® True Union 2000 Ball Valves, 3-Way Ball Valves and Ball Check Valves provide maximum versatility with fully interchangeable valve cartridges. Provides for easier system design modifications and upgrades in multiphase projects, or anywhere changes in valve types are desired. Simply exchange any True Union 2000 valve in-line using existing union nuts. Also mates with Spears® new Schedule 80 Unions and Diaphragm Valves. All True Union 2000 valves feature a low profile, compact design for minimal space requirements. Available in PVC or CPVC with choice of EPDM or Dupont Dow Genuine Viton® O-ring seals and socket, flanged, or optional Spears® patented Special Reinforced (SR) threaded end connectors. Additionally, Spears® offers valve Retrofit Kits for easy in-line replacement of other valves and factory installed Actuation Packages. Assembled with silicone-free lubricant.

True Union 2000 Industrial 3-Way Valve

- Industrial Grade, Multiport, Diverter, L-Pattern & T-Pattern configurations Vertical 3-Way or Horizontal Diverter (shown)
- Built-in Handle Lockout
- Fully Serviceable, Replaceable Components
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- ISO Pattern Actuation Mounting Option
- Spears® Dual O-ring Safe-T-Shear® Stem
- Self Adjusting PTFE Floating Seat Design
- Sizes 1/2” - 2” pressure rated to 235 psi @ 73°F, sizes 2-1/2” - 4” and all flanged to 150 psi @ 73°F
- NSF Certified for Potable Water Use
- Produced in IPS sizes 1/2” - 4” with Socket, Flanged or SR Threaded End Connectors

S4 SPRING CHECK, FOOT, AERATING (VACUUM BREAKER) VALVE - PVC, PP, PVDF

SPECIFICATIONS:

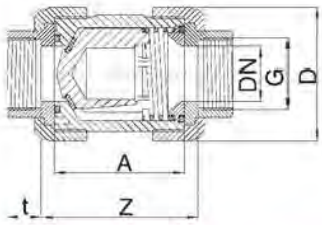
- Sizes: 3/8" - 4" (DN 10 - DN 80)
- Body material: PVC-u - PP - PVDF
- O-rings and check seal: EPDM / FPM (Viton)
- Spring material: 304 stainless, Teflon HASTELLOY-C (optional)
- Foot valve screen material: PP

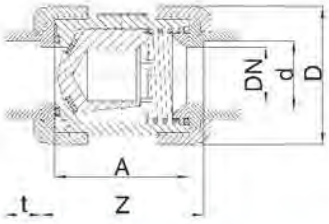
Operating pressure:

3/8" - 2 1/2" 232 psi (16bar)
3" 145 psi (10 bar)
4" 87 psi (6 bar)

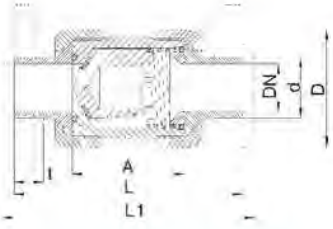
Valve ends:

- Solvent cement socket (ASTM, DIN, JIS)
- Solvent cement spigot (DIN)
- Threaded socket (BSP, NPT)
- Flanged (ANSI, ASA, DIN, JIS)





FEATURES:



- corrosion resistant
- radial installation or removal
- low pressure loss
- suitable for high flow rates
- quick and exact closing and opening
- suitable for liquids with very low specific gravity

Sample Specification:

All Praher s4 series spring check valves, sizes 3/8" - 4" shall be of true union design. The internal spring loaded check design shall guarantee leak tight seating in extreme low pressure and vertical installations. Minimum spring load of 1 lb., spring shall be 304 stainless steel, teflon encapsulated stainless steel or Hastelloy-C. All O-rings and check seals shall be EPDM or VITON and shall meet NSF61 criteria. Union ends shall be interchangeable with s4 series ball valves. PVC shall be NSF61 listed and meet ASTM D1764-cell class 12454. PP shall be conforming to ASTM D4101, cell class PP0210B67272. PVDF shall be conforming to ASTM 3222 cell class type II.

PRAHER VALVES

3-Way Valve & Check Valve Replacement

Above picture is a depiction of a CPVC Valve (red handle) and Check Valve (to the right of the valve and has the appearance of a union)

CAUTION

The new vales are not direct field replacements for existing valves.

These new valves are constructed with threaded ends, and will require additional modification to the existing plumbing. This additional modification is likely to include a threaded nipple (cut in half), and two couplers to adapt to the existing plumbing for each valve.

Municipal Customer Service

PAGE LEFT BLANK ON PURPOSE

SECTION C
OSG Acid Washing Kit/Procedure

PAGE LEFT BLANK ON PURPOSE

Acid Washing Cell

Water with hardness of greater than 1 grain/gallon (17.1 mg/L as CaCO3) feeding the MIOX generator will coat the plates within the cell with solid impurities such as calcium carbonate. Calcium carbonate (CaCO3) is usually white in color but can be other colors depending on dissolved salts in the water. If there is a problem, CaCO3 will most likely be found on the cathode side of the cell. At first, CaCO3 will form a thin hard fi lm and over time, a coating within the cell will grow and flakes will break off and effect system performance. CaCO3 will obstruct, or “blind” the current path and cause a decrease in mixed oxidant (chlorine) production. If uncorrected, the cell can be damaged.

Actions

1. Acid washing the cell according to the procedure written below.
2. Ensure that the water supplied to the cell meets hardness and purity requirements under Appendix A
3. Ensure that the salt supplied to the cell meets with calcium and magnesium requirements under Appendix B

Equipment Needed

Acid Wash Kit Components (Supplied by MIOX in Operations Kit)

1. Acid wash cell union assembly
    a. Union, ¾” CPVC (only the female half is needed)
    b. Reducer, ¾”S x 1/2”Th CPVC
    c. 1/2” MT x 3/8” TB, JG Adapter, PVDF
2. (2) two lengths of 3/8” polyethylene (PE) tubing (7-ft and 5-ft)

Acid Wash Components (not supplied by MIOX)

1. (2x) 5 gallon buckets or similar containers
2. Latex ‘acid’ gloves
3. Face shield
4. Apron
5. Paper towels or rags – 1 Roll
6. Soft Water
7. Acid (hydrochloric acid, muriatic acid, citric acid)
8. Ph Strips

The system must be in Stop Mode prior to beginning the acid wash procedure

Step 1 – Draining the Cell
Tools/Parts Required: 5-gallon bucket, paper towels, 5 foot long 3/8” PE tube

Vault system should be in Standby before proceeding (Refer to the Operations Section of the Manual if you have any questions)

- Place the Run/Stop switch in the Stop position, system will display Stop Mode when performed correctly
- Do not turn OFF all power to the OSG; you will need the Diagnostics Menu. The two fans will continue to run; it is OK to perform maintenance on the system while the fans are running
- Position the 3-way valve on the Oxidant Transfer Line to the drain position. This isolates the OSG from the Solution Storage Tank
- Open the bottom plumbing door and install the 5 foot long PE tube into the blue handle drain valve. Route the other end of the PE Line into a 5-gallon bucket or to a nearby drain

This tubing will be used again to connect the brine pump suction to the bucket

- Drain the cell by opening the blue handle drain valve on the inlet manifold. (See Figure 6-4)

Figure 6-4 Draining the Cell

- Allow for cell to drain for 20-30 seconds then loosen (crack open) the 1/2” female union on the right hand side of the oxidant outlet piping just before it leaves the cell/plumbing cabinet. (See Figure 6-5)

Figure 6-5 Cell Drain - Female Union

- Once the union and drain lines are opened, water will begin to drain from the cell and oxidant plumbing line
- Discard drained water from the cell

- After the cell is drained, close the blue handle drain valve on the inlet manifold and remove the 5 foot long PE tube (refer to Figure 6-4)
- Tighten the female fitting loosened in the previous step
- Capture or soak up any drained water that may have spilled onto plumbing enclosure floor

Ensure that all spilled liquid is cleaned up immediately to prevent corrosion to electrical and metallic fittings

Step 2 – Preparing the Brine Pump Acid Recirculation
Tools/Parts Required: 3/8” PE tubing (7 foot long and 5 foot long), acid wash cell union assembly, 5-gallon bucket

- Remove the tubing from pump inlet quick disconnect fitting (see Figure 6-6)

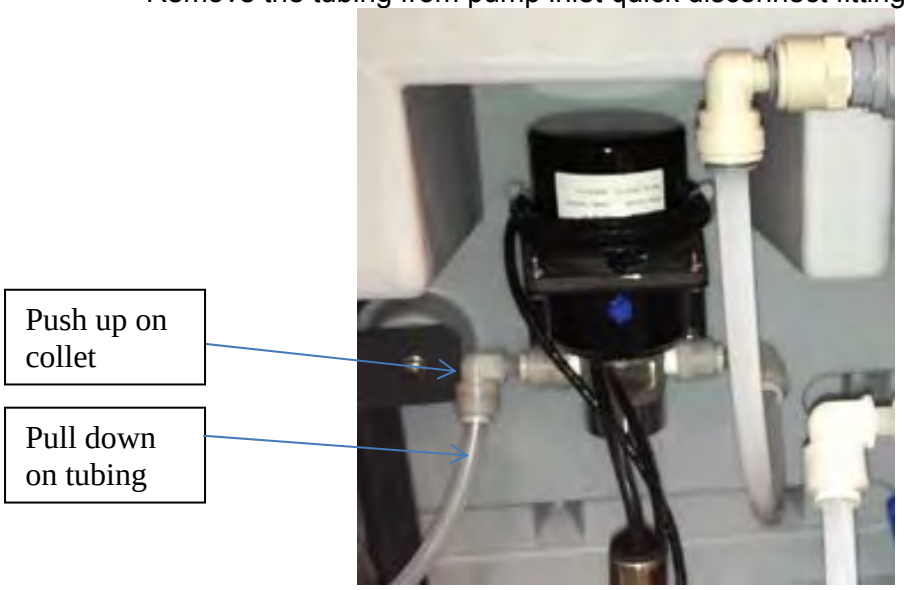

Figure 6-6 Removing Tubing from Pump Inlet

- Route PE tube (5 foot tubing) from **Step 1: Draining the Cell** and insert it into the brine pump inlet quick disconnect fitting
- The other end of the tubing should be inserted into the 5 gallon bucket.
- The brine pump will suction the acid/water solution from the bucket during the acid washing procedure
- Remove the PE tube with 3/8” stem and Elbow from the brine pump check valve and attach it to the blue handled JG valve used to drain the cell in Step 1 (see Figure 6-7)

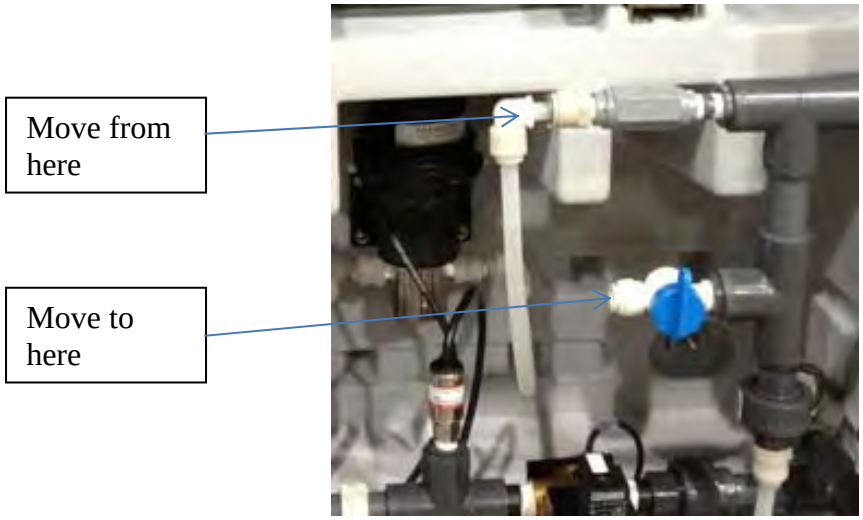

Figure 6-7 Attach new PVDF to blue handle drain valve

- Remove the ¾” oxidant union assembly (female half) on the outside of the cabinet from the male union half
- Replace the union with the ¾” acid wash cell union assembly and 7 foot tube supplied in the Acid Wash Kit
- Route the other end of this line into the 5-gallon bucket. This will allow acid to be discharged from the cell and provide a return path to the 5-gallon bucket during the acid washing recirculation procedure (See Figure 6-8)

Figure 6-8 Attaching Acid Wash Union Assembly

Ensure that all spilled liquid is cleaned up immediately to prevent corrosion to electrical and metallic fittings

Step 3 – Preparing the Acid/Water Mixture
Tools/Parts Required: acid, water, latex gloves, apron, and face shield

Follow the manufacturer's safety instructions when handling acids

- The drain on the cell will NOT permit complete drainage of a cell. Therefore the residual water remaining in the cell is utilized for diluting the acid for a 50/50 mixture.
- In a 5-gallon bucket or similar container prepare one of the following acid solutions.

Refer to Table 6-1 to determining the appropriate volumes of acid and water to generate a 6N HCL acid solution (50/50 mixture)

Table 6-1 Acid Solution

	M15/H25	M30/H50	M45/H75	M60/H100
Total Cell Volume (mL)	1100	2200	3300	4400
Cell Residual Drain Volume (mL)	90	180	270	360
Acid Volume (mL)	550	1100	1650	2200
Water added Volume (mL)	460	920	1380	1840

If weaker acid solutions are chosen, they are still effective. They will sufficiently clean the cell if allowed to sit longer

Example #1

- To make a 6N HCl acid solution, using an M30/H50 cell, add 1100 mL of 37% hydrochloric acid into 920 mL of water. The 180 mL of water that remain in the cell, when mixed with the acid, will provide the proper dilution ratio

- Muriatic acid (31% hydrochloric acid) can be mixed in the same ratio as above. However this is a weaker acid solution than 6N HCl (equivalent to a 5N HCl Solution)

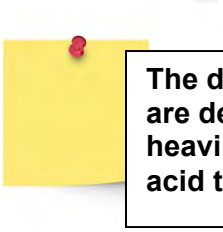
- Citric acid is a weaker acid solution than either 6N HCl or muriatic acid and can be used without dilution

- Follow the manufacturer and local area disposal requirements to safely handle and dispose of the used acid

ALWAYS ADD ACID TO WATER
NEVER ADD WATER TO ACID

Step 4 – Starting the Acid Wash Recirculation
Tools/Parts Required: latex 'acid' gloves, safety glasses, apron, and face shield

Figure 6-11 Acid Wash Recirculation Loop



The system is now ready to begin the acid washing cycle

- From the Main Menu – Enter Diagnostic by pressing on the DIAGNOSTIC button
- Locate Brine Pump Voltage and click on the light blue window (0.00) and a new window will open
- Enter 3 and press on the large check mark to register the new value on the display
- When performed correctly the brine pump will turn ON and the new value will be displayed (3.0)

If acid solution does not begin to flow immediately, it may be necessary to carefully raise the bucket level above the brine pump level for a flooded suction of the pump. Once flow is established the bucket can be returned to the floor

- Allow the pump to circulate acid/water mixture for about 25-30 minutes (50-60 minutes if using a weaker acid solution or if cell is heavily calcified)
- Follow the same procedure to return Brine Pump Volts 0.0 and turn the brine pump OFF
- When finished acid washing, properly dispose of remaining mixture.

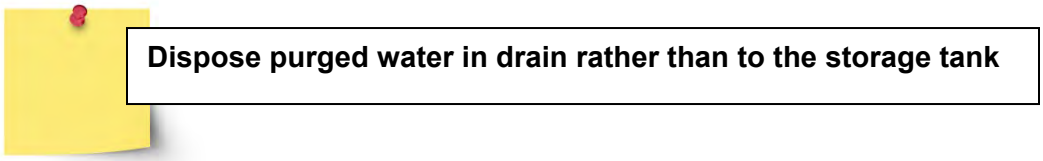
The duration requirements for acid recirculation within the cell are dependent on type of acid and mineral deposits. If the cell is heavily calcified it may be necessary to prepare a new batch of acid to circulate another cycle

Step 5- Acid Removal
Tools/Parts Required: 2nd 5-gallon bucket, latex 'acid' gloves, safety glasses, apron, and face shield

- Fill the 2nd 5-gallon bucket with water and set near by
- With brine pump voltage at 0.00
- Carefully remove the suction line from the 5-gallon bucket with the acid/water mixture
- Place the suction tubing into the a 2nd 5-gallon bucket filled with clean water (used to rinse the cell). Two buckets are now being used simultaneously – one to supply fresh water (supply bucket), the other to collect cell discharge (collection bucket)
- Enter a brine pump voltage of 3.0.
- When the collection bucket is near full, enter a brine pump voltage of 0.0 to turn OFF the brine pump
- Discard water/acid mixture from the collection bucket in accordance to local area and manufacturer's recommendations for proper disposal
- Re-fill the supply bucket with clean water and repeat the process above for rinsing the cell/pump
- When the collection bucket is near full for the second time, enter a brine pump voltage of 0.0 to turn OFF the brine pump
- Discard both buckets in accordance to local area and manufacturer's recommendations for proper disposal

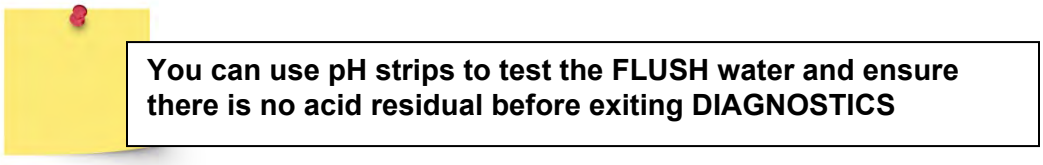
Step 6 – Drain the cell
Tools/Parts Required: 5-gallon bucket, paper towels, 5 foot long PE tubing

- Shut the blue handle drain valve closed
- Disconnect the PE tube with 3/8" stem and Elbow from the blue handle drain valve and move it up to the brine check valve (Reference Figure 6-7)
- Remove the 5 foot long PE tube from the brine pump inlet (suction side) and install it into the blue handle drain valve
- Route the other end of the PE Line to a 5-gallon bucket or to a nearby drain
- Drain the cell by opening the blue handle drain valve on the inlet manifold
- Allow the cell to drain for 20-30 seconds then loosen (crack open) the 1/2" female union on the right hand side of the oxidant outlet piping just before it leaves the cell/plumbing cabinet
- Once the union and drain lines are opened, water will begin to drain from the cell and oxidant plumbing line
- Discard drained water from the cell
- After the cell is drained, close the blue handle drain valve and remove the 5 foot long PE tube
- Tighten the female union loosened in the previous step
- Capture or soak up any drained water that may have spilled onto plumbing enclosure floor



Ensure that all spilled liquid is cleaned up immediately to prevent corrosion to electrical and metallic fittings

Step 7 – Return Cell and Pump Plumbing to Normal Operating Conditions
Tools required: 5-gallon bucket, paper towels or rags.



- Install the tubing to the pump inlet (coming from brine solenoid) (from Figure 6-6)
- Remove the acid wash ¾" cell union assembly and reconnect the oxidant exit plumbing union
- Verify the blue handle drain valve on the inlet manifold is closed.

The acid washing kit has now been removed. Please look over and tighten any fitting that may be loose and ensure a closed loop within the plumbing cabinet

Step 8 – Cell Water Flush
Tools Required: None

- Enter DIAGNOSTICS
- Initiate a flush by pushing the FLUSH button
- Allow the system to flush fresh water through the cell for 10 minutes to remove any residual acid that may remain in the cell
- End the flush by the pushing the FLUSH button again
- Exit DIAGNOSTICS by pressing the MAIN MENU button
- Position the 3-way valve on the oxidant discharge line (outside of the OSG cabinet) to the tank position
- The system is now ready for standard operation

Step 9 – System Re-start
Tools Required: None

- Re-start the system in accordance with the operations and maintenance manual
- While the system stabilizes water flow, continually check for leaks in the plumbing compartment
- Monitor system operations for 15 to 20 minutes after the acid wash

This Concludes the Procedure

TRADITIONAL STANDARD SERIES
FILTER HOUSINGS

EXCELLENT CHEMICAL RESISTANCE FOR MANY RESIDENTIAL, COMMERCIAL AND INDUSTRIAL APPLICATIONS

Pentair Standard Filter Housings are manufactured of a durable polypropylene or clear Styrene-Acrylonitrile (SAN). All are equipped with 3/4" NPT inlet and outlet ports. Standard Filter Housings are available in both 10" and 20" lengths and will accommodate a wide range of 2-1/2" to 2-7/8" diameter cartridges. The reinforced polypropylene cap offers an optional pressure-relief button on the inlet side to relieve pressure inside the housing when changing filter cartridges.

Reinforced polypropylene housings have excellent chemical resistance and are ideal for many residential, commercial and industrial applications. Clear sumps offer on-site examination of the cartridge.

Opaque Standard Filter Housings are molded from rugged reinforced polypropylene. They offer outstanding chemical compatibility and are ideal for use in a variety of low-flow applications.

Clear Standard Filter Housings offer on-site examination of flow, performance, and cartridge life. They are ideal for a variety of applications.

FEATURES/BENEFITS

Ideal for a wide range of applications, including residential, commercial and industrial

Available in 10" and 20" lengths

Thick walls for increased strength

Optional pressure relief/bleed button on inlet side of cap

Leak-proof seal

Available with clear or opaque sumps

SPECIFICATIONS

Housing – Polypropylene (opaque) or Styrene Acrylonitrile (clear)

Cap – Reinforced polypropylene

Button Assembly – 300 Series stainless steel, EPDM, and polypropylene

O-Ring – EPDM

Temperature Rating– 40-125°F (4.4-51.7°C)

Maximum Pressure – 125 psi (8.6 bar)

NSF COMPONENT

The 150001, 150002, 150067, 150068, 150071, 150072, 150328, 150435 and 150436 are Tested and Certified by NSF International to NSF/ANSI Standard 42 for material and structural integrity requirements.

Vorex Filter Cartridges

Introduction

The new and improved Vorex filter cartridge is designed for higher efficiency and fewer changeouts.

Our Vorex filters are manufactured through an exclusive process that thermally bonds pure polypropylene microfibers. Lower density fibers are at the surface and sequentially higher density fibers are used toward the center. This process traps particles more evenly throughout the cross section.

The Vorex is a nominally rated filter that works well as either a pre-filter or final filter in a wide range of applications including industrial, chemical process, food & beverage, cosmetics and water.

FDA Compliant, NSF Certified Materials

FSI offers filter cartridges which meet FDA guidelines and are certified under NSF standards:

- FSI's polypropylene microfiber media complies with the appropriate U.S. Food and Drug Administration guidelines, as outlined in the Code of Federal regulations, Title 21, Sections 177.1520 (a), (1) and Section 177.1520 (c), (1.1).
- Vorex filter cartridges are certified by NSF International under ANSI/NSF Standard 42.

HOW TO ORDER

Example: CMMF02520

Type of Filter:
CM = Meltblown cartridge

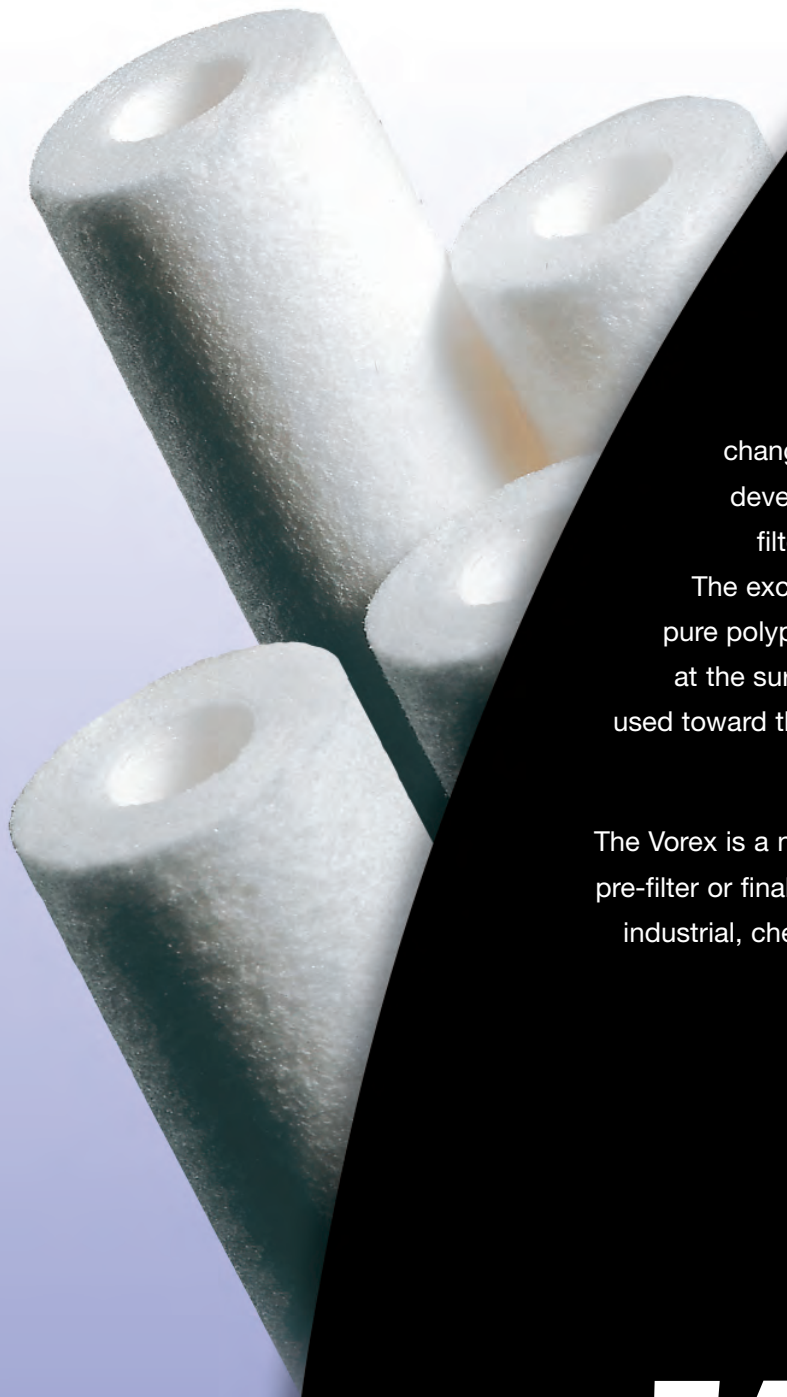
Material:
MF = Microfiber
MFGF = Microfiber, glazed finish

Micron Rating:
001, 005, 010, 025, 050, 075, 100 and 150

Length*:

9.75"	29.5"
10"	29.75"
19.5"	30"
19.75"	39"
20"	39.5"
29.25"	39.75"
	40"

NOTE:
* = Standard lengths listed. Custom lengths available.



- Vorex filter cartridges meet the requirements of a USP Plastic Class VI as demonstrated by USP Biological Reactivity Tests, In Vivo.

Features:

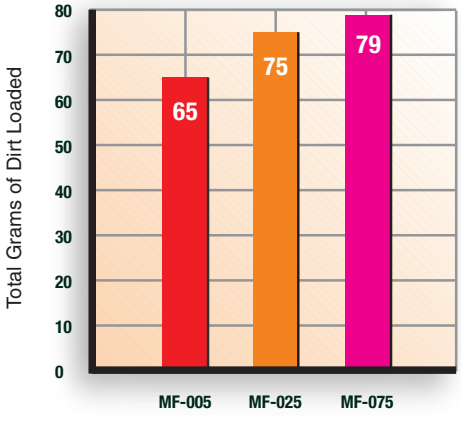
- Greater dirt holding – longer life
- Fewer filter changeouts
- No fiber migration
- 100% polypropylene
- High flow rates with lower pressure drops
- Easy disposal (incinerates to non-volatile trace ash)
- Supports a wide range of industrial and chemical applications
- Very competitive economical pricing

NSF COMPONENT

FILTER SPECIALISTS, INC.
Innovative Solutions. Clear Results.

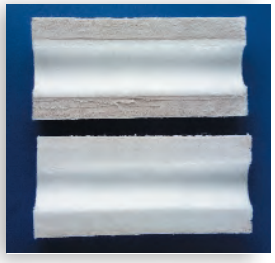
The New Vorex
FILTER CARTRIDGE

The new and improved VOREX FILTER CARTRIDGE is designed for higher efficiency and fewer changeouts. The extensive research invested in the development of this filter has resulted in a superior filter cartridge that works better and lasts longer. The exclusive manufacturing process thermally bonds pure polypropylene microfibers. Lower density fibers are at the surface and sequentially higher density fibers are used toward the center, therefore particles are trapped more evenly throughout the entire cross section.



The Vorex is a nominally rated filter that works well as either a pre-filter or final filter in a wide range of applications including industrial, chemical process, food/beverage, cosmetics and water applications. *Meets FDA requirements.

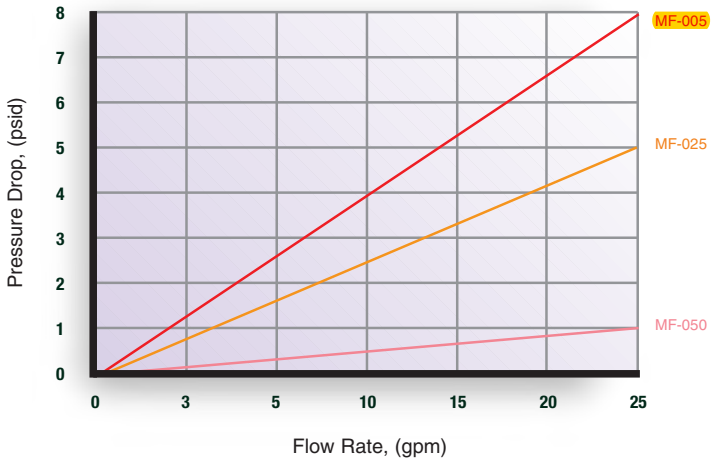
Vorex
FILTER CARTRIDGE



The Vorex Advantage

- *Greater dirt holding—longer life*
- *Fewer filter changeouts*
- *No fiber migration*
- *100% polypropylene*
- *High flow rates with lower pressure drops*
- *Easy disposal (incinerates to non-volatile trace ash)*
- *Supports a wide range of industrial and chemical applications*
- *Very competitive economical pricing*

Dirt Holding Capacity



Many factors can influence cartridge life, like the type of solids loading, viscosity, etc,. For specific applications contact a FSI representative.

Vorex Filters trap contaminants throughout the entire cross section for improved dirt holding capacity and longer life.

Standard microfiber cartridges offer less volume for holding contaminants.

Clear Water Pressure Drop

This chart shows the Vorex filter cartridge life span as related to pressure drop. Results may vary in actual service.

Bourdon Tube Pressure Gauges

Stainless Steel Case / Copper Alloy Wetted Parts

Industrial Series Liquid Fillable • Type 21X.53

Pressure Gauges

0-100 PSI

Application
Suitable for environments compatible with copper alloy wetted parts where vibration or pressure pulsation occur and for gaseous or liquid media that will not obstruct the pressure system.

Sizes (All sizes not stocked)
2", 2½", 4" (50, 63, and 100 mm)

Accuracy
± 1.5% of span

Ranges (All ranges not stocked)
Vacuum / Compound to 30"HG / 0 / 200 PSI
Pressure from 15 PSI to 10,000 PSI - 2"
Pressure from 10 PSI to 15,000 PSI - 2½",4"
or other equivalent units of pressure or vacuum

Working Range

2" & 2½"	Steady:	3/4 of full scale value
	Fluctuating:	2/3 of full scale value
	Short time:	full scale value
4" & 6"	Steady:	Full scale value
	Fluctuating:	0.9 x full scale value
	Short time:	1.3 x full scale value

Operating Temperature
Ambient: -40°F to 160°F (-40°C to 71°C) NOTE1
Media: max. 140°F (+60°C)

Temperature Error
Additional error when temperature changes from reference temperature of 68°F (20°C) ±0.4% for every 18°F (10°C) rising or falling. Percentage of span.

Standard Features

Connection
Material: copper alloy
Lower mount (LM)
Center back mount (CBM) - 2" & 2½"
Lower back mount (LBM) - 4"
1/4" or 1/2" NPT limited to wrench flat area
(7/16"-20" SAE thread for **Type 213.53S**)

Bourdon Tube
Material: copper alloy
30"Hg (Vac) to 1000 PSI C-type - 2", 2½"
30"Hg (Vac) to 1000 PSI C-type - 4"
1500 PSI to 15,000 PSI helical type - 2", 2½"
1500 PSI to 15,000 PSI helical type - 4"

Movement
Copper alloy

Dial
White ABS with stop pin and black lettering

Pointer
Black aluminum (external "zero" adjust screw-optional)

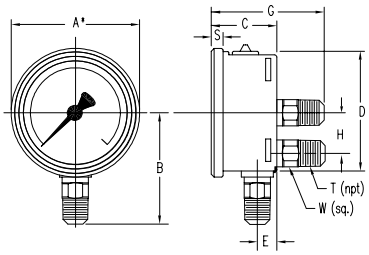
Case
304 stainless steel with vent plug and stainless steel crimp ring.

O-ring (case/connection sealing):
EPDM for standard stocked glycerine filled gauges. Viton for standard stocked dry gauges, suitable for glycerine, silicone or fluoroube case filling

Weather Protection
Weather resistant (NEMA 3 / IP 54) - dry case
Weather tight (NEMA 4X / IP 65) - liquid-filled case

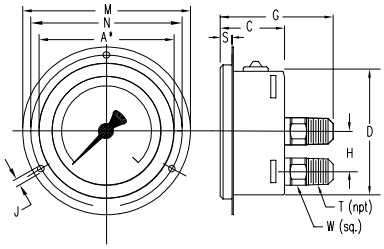
Standard Scale
PSI
PSI, PSI/KG/CM², PSI/BAR (2½")

Window Gasket
Buna-N



Window
Polycarbonate
Acrylic (4")

Case Filling
212.53 - None
213.53 - Glycerine



Order Options (min. order may apply)
Other pressure connections limited to wrench flat area
Stainless steel polished front flange
Stainless steel rear flange- 2½" & 4"
Brass threaded or press-fit restrictor
Pressure compensating membrane window for filled gauges
Dry case (**212.53**)
Steel zinc plated u-clamp bracket (field installable)
Stainless steel u-clamp bracket (field installable)
DIN standards
External zero adjustment (2½" only)
Externally adjustable red drag pointer (max. hand)
Externally adjustable red mark pointer (set pointer)
Other pressure scales available:
Bar, kPa, MPa, Kg/cm² and dual scale
Custom dial layout
Silicone or fluorolube case filling **(Type 213.53)**

Note 1 Temperature Ranges (Liquid filled gauges)
Glycerine: -4°F to 140°F (-20°C to 60°C)
Silicone: -40°F to 140°F (-40°C to 60°C)

PVC & CPVC TRUE UNION 2000 VALVES

TU2000-2-0605

One of the Most Versatile, Compact Valve Designs Available

Spears® True Union 2000 Ball Valves, 3-Way Ball Valves and Ball Check Valves provide maximum versatility with fully interchangeable valve cartridges. Provides for easier system design modifications and upgrades in multiphase projects, or anywhere changes in valve types are desired. Simply exchange any True Union 2000 valve in-line using existing union nuts. Also mates with Spears® new Schedule 80 Unions and Diaphragm Valves. All True Union 2000 valves feature a low profile, compact design for minimal space requirements. Available in PVC or CPVC with choice of EPDM or Dupont Dow Genuine Viton® O-ring seals and socket, flanged, or optional Spears® patented Special Reinforced (SR) threaded end connectors. Additionally, Spears® offers valve Retrofit Kits for easy in-line replacement of other valves and factory installed Actuation Packages. Assembled with silicone-free lubricant.

True Union 2000 Industrial Ball Valve

- Multi-featured Industrial Grade
- Built-in Handle Lockout
- Fully Serviceable, Replaceable Components
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- ISO Pattern Actuation Mounting Option
- Spears® Dual O-ring Safe-T-Shear® Stem
- Self Adjusting PTFE Floating Seat Design
- Sizes 1/2" - 2" pressure rated to 235 psi @ 73°F, sizes 2-1/2" - 6" and all flanged to 150 psi @ 73°F
- NSF Certified for Potable Water Use
- Also Available in **SPEARS® LXT™** High Purity, Low Extractable PVC Material
- Produced in IPS sizes 1/2" - 6" with Socket, Flanged or SR Threaded End Connectors

True Union 2000 Industrial 3-Way Valve

- Industrial Grade, Multiport, Diverter, L-Pattern & T-Pattern configurations Vertical 3-Way or Horizontal Diverter (shown)
- Built-in Handle Lockout
- Fully Serviceable, Replaceable Components
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- ISO Pattern Actuation Mounting Option
- Spears® Dual O-ring Safe-T-Shear® Stem
- Self Adjusting PTFE Floating Seat Design
- Sizes 1/2" - 2" pressure rated to 235 psi @ 73°F, sizes 2-1/2" - 4" and all flanged to 150 psi @ 73°F
- NSF Certified for Potable Water Use
- Produced in IPS sizes 1/2" - 4" with Socket, Flanged or SR Threaded End Connectors

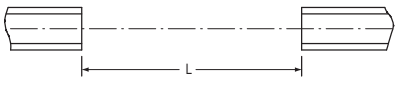
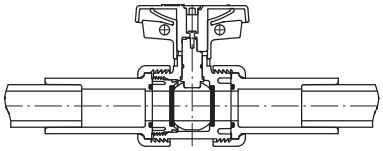
Economical True Union 2000 Standard Ball Valve

- High quality Standard Ball Valve
- Allows future system upgrade
- Excellent for OEM Applications
- Replaceable Seats
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- Spears® Safe-T-Shear® Stem
- Self Adjusting Floating Seat
- Sizes 1/2" - 2" pressure rated to 235 psi @ 73°F, sizes 2-1/2" - 4" and all flanged to 150 psi @ 73°F
- NSF Certified for Potable Water Use
- Produced in IPS sizes 1/2" - 4" with Socket, Flanged or SR Threaded End Connectors
- Also available in PVC White



True Union 2000 Retrofit Valves or Kits



Easily converts any system over to all True Union 2000 style valves for consistent valve type and uniform maintenance. Special extended socket style End Connectors (2) allow retrofit replacement of other brand valves in existing piping systems with a new True Union 2000 valve. Simply cut out old valve according to specified dimension and install retrofit end connectors. End connectors are provided with either EPDM or genuine Viton® O-rings. Can be ordered as End Connector Kit or fully assembled Retrofit Valve.

3-Way Port Options

True Union 2000 Actuated Valves

Universal ISO Actuator Mounting Pattern Option

Spears® offers optional actuator mounting with standard ISO Mounting Pattern for user actuation of True Union 2000 Ball Valves.

Factory Actuated Valve Packages

Spears® Electric or Pneumatic Actuation Packages eliminate customer's having to determine proper valve and actuator mating. Pre-matched packages insure proper torque, coupling and mount for optimum performance - all factory installed and tested for proper alignment and operation. Actuation packages can be custom built to user specifications from Spears® wide selection of options, voltages and accessories. Contact Spears® for additional information.

Foot Valve Screens

- Easily converts Ball Check Valve to a Foot Valve.
- Standard IPS spigot connection fits slip-socket valve end connector.
- Enlarged screen provides open area equivalent to valve for optimum flow characteristics.
- Chemical and corrosion resistant PVC or CPVC construction.

Typical Application (VALVE NOT INCLUDED)

Split Nut Kit for True Union 2000 Valves & Union 2000 Schedule 80 Fittings

Split Nut Kits are designed to replace broken union nuts on Spears® True Union 2000 Ball Valves and Union 2000 Schedule 80 Unions. Kit includes SS316 Gear Clamp and 2-Split Nut halves. Can also be used if nut was not in place during end connector installation. Split Nut is fully serviceable to original valve pressure rating.

NOT FOR USE WITH COMPRESSED AIR OR GASES

Spears® Manufacturing Company DOES NOT RECOMMEND the use of thermoplastic products to transport or store compressed air or gas.

Viton® is a registered trademark of DuPont Dow Elastomers

APPROVED BY:	DATE: 12/01/08	

KINETICO®

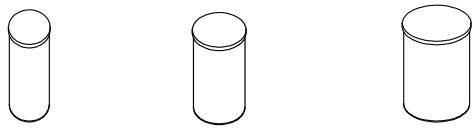
System Components

Media Vessel (qty) Size ..... (2) 8 x 40”
Media Vessel Construction ..... Wrapped Polyethylene
Empty Bed Volume ..... 1.04 ft^3
Media ..... 0.70 ft^3 Non Solvent Cation Resin
Bed Depth / Free Board ..... 25” / 15“
Riser Tube ..... 1” ABS
Distributor Upper ..... 0.014” Slots, ABS Basket
Lower ..... 0.014” Slots, ABS Basket
Under bedding ..... None
Regeneration Control ..... Non-electric Use Meter
Regeneration Type ..... Countercurrent
Meter Type ..... .0.75 - 40.00 gpm Polypropylene Turbine (Kinetico Full Louver Flow Nozzle)
Optional Meter ..... .0.05 - 5.00 gpm Polypropylene Turbine (Kinetico Micro Flow Nozzle)
..... .0.5 - 2500 gpm Polypropylene Turbine (Kinetico Half Louver Flow Nozzle)

Inlet Water Quality

Pressure Range ..... 25 – 125 psi Dynamic Pressure
Temperature Range ..... 35 – 120° F
pH Range ..... 5 – 10 SU
Free Chlorine Cl_2 (Max.) ..... 2.0 mg/l

Operating Specs



Flow, Half Louver and Full Louver (15 psig) ..... 11.5 gpm
Flow, Micro Nozzle (15 psig) ..... 5.0 gpm
Dimensions (width x depth x height) ..... 17 x 8 x 46”
Weight (Operating / Shipping) ..... 200 / 140 lbs.

Connections

Inlet / Outlet Connections ..... Custom Adapter and E-Clip (1 ½” Brass Sweat Fittings Included)
Drain Connection ..... 0.5” Tube
Brine Line Connection ..... .0.375” Tube
Power ..... None

System Part Numbers

CP 208s OD, no brine tank 11700
CP 208s OD, empty, no brine tank 11702
Brine Venturi Nozzle - dark blue (for central brining) 2117
Micro Nozzle (for low flow applications) 10880

Brine Tank Options

	24 x 50”	30 x 50”	50 x 60”
Brine Tank Part Number	68370A	68373A	68371A
Brine Tank Internals	4781	4781	4781
Brine Line Check Valve (1 for each softener in parrallel)	7952	7952	7952
Salt Capacity	875 lbs	1,350 lbs	4,500 lbs.
Material	HDPE	HDPE	HDPE
Overflow Connection	5/8” Tube	5/8” Tube	5/8” Tube
Brine Connection	1/2” Tube	1/2” Tube	1/2” Tube

Regeneration Specifications

Regeneration Volume / Time ..... 35 gallons / 45 minutes
Backwash Flow Control ..... 2.00 gpm
Brine Refill Flow Control ..... 0.40 gpm

*Compensated hardness in gpg = Hardness + (3 x Fe in mg/l)

revision date: August 22, 2005

CP 208s, central brining

Operating Profile
Softener shall remove hardness to less than 1/2 gpg when operated in accordance with the operating instructions. The system shall include two tanks. This duplex configuration shall operating in an alternating mode with one tank will be on-line during service. During regeneration cycles, one tank shall provide water to service and to the regenerating tank. A water meter shall initiate system regeneration. The water meter shall measure the processed volume and be adjustable. Service flow shall be down-flow and regeneration flow shall be up-flow.

Regeneration Control Valve
The regeneration control valve shall be top mounted (top of media tank), and manufactured from non-corrosive materials. Control valve shall not weigh more than four pounds. Control valve shall provide service and regeneration control for two media tanks. Inlet and outlet ports shall accept a quick connect, double o-ring sealed adapter. Interconnection between tanks shall be made through the regeneration valve with a quick connect adapter. Control valve shall operate using a minimum inlet pressure of 25 psi. Pressure shall be used to drive all valve functions. No electric hook-up shall be required. Control valve shall incorporate three operational cycles including; service, brine draw and a combined fast rinse and brine refill. Service cycle shall operate in a down-flow direction. The brine cycle shall flow up-flow, opposite the service flow, providing a countercurrent regeneration. Control valve shall contain a fixed orifice eductor nozzle and self-adjusting backwash flow control. The control valve will prevent the bypass of hard water to service during the regeneration cycle.

Media Tanks
The tanks shall be designed for a maximum working pressure of 125 psi and hydrostatically tested at 300 psi. Tanks shall be made of polyethylene and reinforced with a fiberglass wrapping. Each tank shall include a 2.5 in. threaded top opening. Each tank shall be NSF approved. Upper and lower distribution system shall be of a slot design. Distributors will provide even flow of regeneration water and the collection of processed water.

Conditioning Media
Each softener shall include a non-solvent, high capacity cation resin having a minimum exchange capacity of 30,000 grains/ft^3 when regenerated with 15.0 lbs/ft^3. The media shall be solid, of a proper particle size and shall contain no plates, shells, agglomerates or other shapes, which might interfere with the normal function of the water softener.

Brine System
System is designed to work with a central brining system, utilitzing a continuous brine make-up. Brine tank is recommended to include a safety overflow connection to be plumbed to a suitable drain.

PAGE LEFT BLANK ON PURPOSE

Poly Glass™ Vessels

Product Features
- For residential and light commercial water softener/filtration applications
- Slim diameter with capacities from 2 to 49 gallons
- Unmatched for strength and chemical resistance
- 10-year warranty for 6" - 13" vessels
- 5-year warranty for 14" - 16" vessels

Material of Construction
- Inner shell of polyethylene
- Threaded inlet in various sizes

Operating Parameters
- Maximum operating pressure: 150 psi
- Maximum operating temperature: 120°F

Pentair Design Parameters
- Safety factor: 4:1
- Minimum burst at 600 psi
- Tested to 250,000 cycles without leakage

NSF Design Parameters
- Safety factor: 4:1
- Minimum burst at 600 psi
- Tested to 100,000 cycles without leakage

Part no. 40845
Rev 9/05

Requirements for POE Water Softeners under *NSF/ANSI 44*

By Rick Andrew

Cation exchange water softening is a well-known, well-understood technology that is successfully employed in many hard-water regions of North America as well as internationally. There is an American National Standard for testing and certification of these products—*NSF/ANSI 44*. Many readers may be familiar with the concepts of softening capacity, pressure drop, accuracy of the brining system and other requirements of this standard. But do you know the details?

This column will help to provide those details, including the conservative testing requirements and nuances of scope present in the standard. As you will see, the requirements are well thought out based on the considerations involved with the safety and operation of residential water softeners.

A question of scope

NSF/ANSI 44 defines a residential softener as a regenerable cation exchange system with conventional plumbing fittings not exceeding 1.25-inch (31.75 mm) NPS (nominal pipe size). Any softener with an inlet exceeding 1.25 inches is not considered residential, at least for purposes of *NSF/ANSI 44* and falls outside the scope of the standard.

Notice that the definition is not related to resin tank size, amount of cation exchange resin or system salt settings, but is based solely on the inlet size of the control valve. Also note that any physical or magnetic water conditioning systems are outside the scope of *NSF/ANSI 44*, because the standard is limited to cation exchange systems.

Disposable cartridge filters containing cation exchange resin fall outside the scope of the standard. This is because, although some do use cation exchange technology, they are not regenerable.

POE systems under NSF/ANSI 61

In late 2007, the scope of *NSF/ANSI 61* was revised to include POE systems and components. This means that water softeners can be certified either to *NSF/ANSI 44*, *NSF/ANSI 61* or both.

The main difference is that *NSF/ANSI 61* requires only conformance to the material safety requirements. *NSF/ANSI 44* requires conformance to material safety, structural integrity, pressure drop, softening capacity, softening performance, brine accuracy and product literature requirements.

Obviously, *NSF/ANSI 44* is a much more comprehensive standard for POE water softeners than *NSF/ANSI 61*. For this reason, NSF recommends that POE softeners be certified to *NSF/ANSI 44*.

A multitude of tests

A summary of the testing requirements of *NSF/ANSI 44* is included in Figure 1. A formulation review for all materials in contact with drinking water and material extraction test is required to establish that no contaminants leach from the softener at concentrations of toxicological concern.

A total of 100,000 cyclic and 15-minute hydrostatic tests are required to establish the long-term durability of the system as well as its resistance to pressure spikes. A pressure drop test confirms that the softener will not cause a drop of more than 15 psi in line pressure when operated at the manufacturer's rated service flow.

Softener capacity is determined by testing at one half of the manufacturer's rated service flow. The feed water must have a hardness of 20 ± two grains per gallon. Capacity testing is required at the lowest and highest salt settings and the setting closest to the midpoint of the range of salt settings.

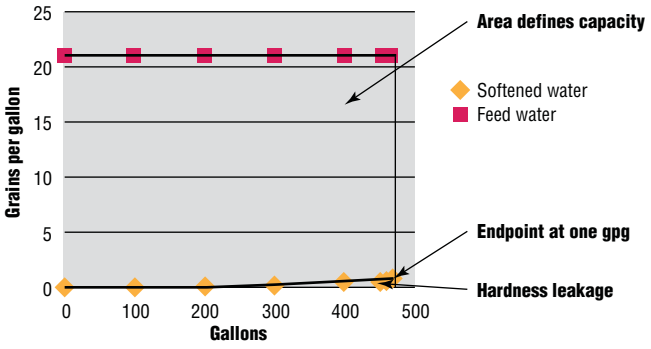
Capacity for other non-tested salt settings is interpolated from the three measured capacities. Extrapolation is not allowed, so testing at the low and high salt settings is critical. Each test of capacity is conducted by first regenerating with a precisely measured amount of saturated brine. The softener's brine system is not utilized due to potential variation in the amount of regenerant salt.

The endpoint of the test is defined as one grain per gallon breakthrough in the softened water. The hardness leakage

Figure 1. NSF/ANSI 44 test descriptions

Requirement	Test description
Material safety	Formulation review for all wetted materials + extraction testing
Structural integrity	100,000 cyclic and 15-minute hydrostatic pressure testing
Pressure drop	Differential pressure between inlet and outlet may not exceed 15 psig at rated service flow
Exchange capacity	Softener challenged at one half of rated service flow with 20 grain per gallon feed water, endpoint when treated water reaches one grain per gallon
Rinse effectiveness	Net chloride in softened water must not exceed 100 mg/L after regeneration
Softening performance	System must produce soft water at rated service flow for 10 minutes after regeneration
Accuracy of the brine system	Salt used for regeneration must be within 15 percent of nominal salt setting

throughout the run is subtracted off when the capacity is determined, so that capacity is reflective of the exact amount of hardness removed. Three successive runs within 10 percent of the average of the three runs are required, with the average value being considered the official capacity at that salt setting. See Figure 2 for a graph of an example capacity run.



During capacity testing, the amount of residual chloride in the softened water is measured after regeneration. The net increase in chloride concentration from the softener may not exceed 100 mg/L. This indicates that the rinse is sufficient to rid the softened water of excess salt.

A separate test known as 'softening performance' is required. This test involves regeneration of the softener at the lowest salt setting and operation at the manufacturer's rated service flow. Samples of product water are taken each minute for 10 minutes and the hardness of the water may not exceed one grain per gallon for any of these samples.

Because the brine system is not used when conducting capacity testing, accuracy of the brine system must be determined through a separate test. This testing is conducted at the lowest and highest salt settings and the setting closest to the midpoint of the range. It involves weighing the brine tank before and after regenerations and three successive runs within 15 percent of the nominal salt setting must be achieved.

For example, a 10-pound salt setting successful brine accuracy test would require the weight of the brine tank to decrease by 8.5 to 11.5 pounds after each regeneration, for a series of three regenerations. There is an alternate procedure that may be used for time-controlled brine systems, involving calculations based on saturated brine.

Figure 2. Typical capacity test

Softener efficiency

In this day and age of potential bans on water softeners due to concerns about salinity, efficiency is a very hot topic. Although efficiency is not required for certification to *Standard 44*, it may be required by state or local regulations.

This is true especially in western states like California that have water salinity problems. And states that currently do not have efficiency requirements for softeners may be moving in that direction.

Efficiency is based on the amount of hardness capacity per amount of regenerant salt and per volume of regenerant water. Efficient softeners require less salt and/or regenerant water to achieve the same amount of softening capacity as less efficient softeners. This results in less water consumption and less salinity added to the environment.

The efficiency of softeners varies with the amount of salt used for regeneration. The higher the salt dosage, the lower the salt efficiency. There are diminishing returns in terms of softening capacity for regenerating with more and more salt. In fact, there is a point at which additional salt used in regeneration will not achieve any more softening

capacity and will simply be rinsed out of the system.

Efficiency is calculated from data measured and recorded during capacity testing. The requirements for efficiency are included in Figure 3. Only demand initiated regeneration (DIR) softeners may claim efficiency. A softener must achieve both salt efficiency and water efficiency in order to be 'efficiency rated.'

Figure 3. NSF/ANSI 44 efficiency requirements for DIR softeners only

Parameter	Efficiency requirement
Salt efficiency	At least 3,350 grains of capacity per pound of regenerant salt
Water efficiency	At least 1,000 grains of capacity per five gallons of regeneration water

Also any efficiency specifications or statements must refer to the salt setting at which the efficiency was achieved. The State of California has a more stringent requirement for salt efficiency ratings than does *Standard 44*, requiring at least 4,000 grains of capacity per pound of regenerant salt.

Conformance by calculation—certification of families of softeners

Standard 44 includes procedures to calculate pressure drop, capacity and efficiency for softeners that are similar to the test unit. There are specific requirements for softeners to be considered 'similar,' including:

- same control valve
- same distributor (length of distributor tube can vary with size of resin tank)
- limitations on variation in cation exchange resin specifications
- limitations on amounts of resin
- limitations on resin tank size
- limitations on regeneration volumes
- limitations on flow rates
- limitations on salt dosages

The concept is that a line of softeners built with the same control valve can be certified based on testing one or a few of them and then using calculations included in the standard to calculate pressure drop, capacity and efficiency for the non-tested models. The limitations are designed to keep only softeners that function similarly in the same family.

The equations used for calculations have proven accurate in practice. Conformance by calculation allows manufacturers to certify broad lines without unnecessarily testing each one of many very similar softeners.

A comprehensive standard

As you can see from this brief overview, *Standard 44* requires testing all relevant aspects of water softeners, from material safety to accuracy of the brine system. This means that a number of tests are required, each one designed to evaluate different aspects.

This is in contrast to *Standard 61*, which requires an evaluation for material safety only. Although POE softeners may be evaluated under and certified to either one, the comprehensiveness of *Standard 44* makes it the clear choice.

About the author

Rick Andrew is the Operations Manager of the NSF Drinking Water Treatment Units Program for certification of POE and POU systems and components. Prior to joining NSF, his previous experience was in the area of analytical and environmental chemistry consulting. Andrew has a Bachelor's Degree in chemistry and an MBA from the University of Michigan. He can be reached by phone at 1-800-NSF-MARK or by email at Andrew@nsf.org.

DOWEX™ HCR-S

A High Capacity Cation Exchange Resin for Softening and Demineralization Applications

Product	Type	Matrix	Functional group
DOWEX™ HCR-S	Strong acid cation	Styrene-DVB gel	Sulfonic acid

Guaranteed Sales Specifications		Na^+ form	H^+ form
Total exchange capacity, min.	eq/L	2.0	1.8
	kgr/ft³ as $CaCO_3$	43.7	39.3
Bead size distribution range† 300 - 1,200 µm, min. (50 mesh - 16 mesh)	%	90	90
Acidity range	pH	7.0 - 10.5	—
Color throw, as packaged, max.	APHA	20	—

Typical Physical and Chemical Properties		Na^+ form	H^+ form
Water content	%	44 - 48	50 - 56
Whole uncracked beads	%	90 - 100	90 - 100
Total swelling ($Na^+ \rightarrow H^+$)	%	8	8
Particle density	g/mL	1.28	1.22
Shipping weight	g/L	820	780
	lbs/ft³	51	49

Recommended Operating Conditions

- Maximum operating temperature: 120°C (250°F)
- pH range 0 - 14
- Bed depth, min. 800 mm (2.6 ft)
- Flow rates:
  - Service/fast rinse 5-50 m/h (2-20 gpm/ft²)
  - Backwash See figure 1
  - Co-current regeneration/displacement rinse 1-10 m/h (0.4-4 gpm /ft²)
- Total rinse requirement 3 - 6 Bed volumes
- Regenerant: 1-8% H_2SO_4, 4-8% HCl or 8-12% NaCl

† For additional particle size information, please refer to Particle Size Distribution Cross Reference Chart (Form No. 177-01775).

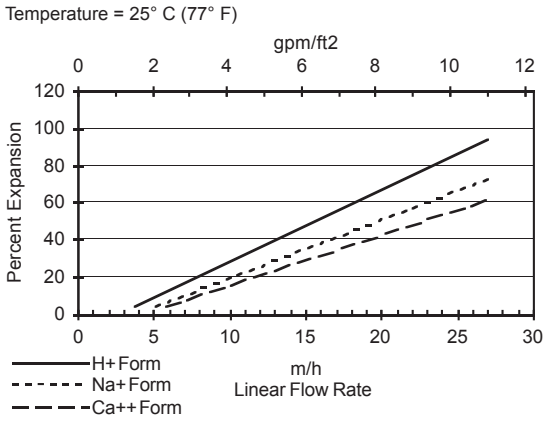
Typical Properties and Applications



DOWEX™ HCR-S cation exchange resin is a high capacity resin with excellent kinetics and good physical, chemical and thermal stability.

DOWEX HCR-S cation exchange resin is well suited for industrial water softening and demineralization in the co-current mode of regeneration.

Packaging

25 liter bags or 5 cubic feet fiber drums

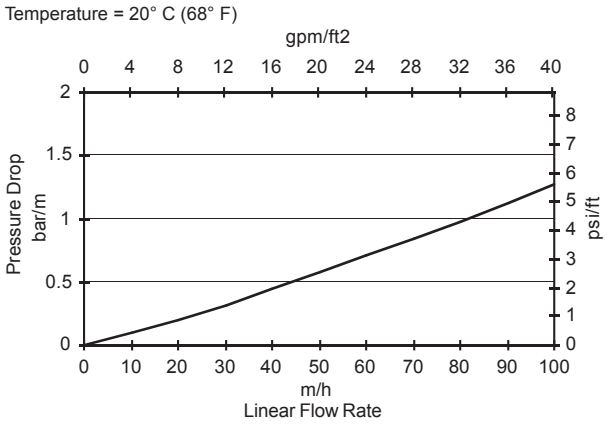


Figure 1. Backwash Expansion Data

For other temperatures use:

$F_T = F_{77°F}$ [1+ 0.008 ($T_{°F}$ -77)], where F ≡ gpm/ft^2
$F_T = F_{25°C}$ [1+ 0.008 (1.8$T_{°C}$ - 45)], where F ≡ m/h

Figure 2. Pressure Drop Data

For other temperatures use:

$P_T = P_{20°C}$ / (0.026 $T_{°C}$ + 0.48), where P ≡ bar/m
$P_T = P_{68°F}$ / (0.014 $T_{°F}$ + 0.05), where P ≡ psi/ft

Note: These resins may be subject to drinking water application restrictions in some countries: please check the application status before use and sale.

Warning: Oxidizing agents such as nitric acid attack organic ion exchange resins under certain conditions. This could lead to anything from slight resin degradation to a violent exothermic reaction (explosion). Before using strong oxidizing agents, consult sources knowledgeable in handling such materials.

694 SERIES CHECK VALVE

694 Poppet Check Valve Design Considerations

The 687 Series Poppet Check Valve incorporates a thin elastomer disc supported by a poppet that seals on the seat. Pressure in the flow direction moves the seal off the seat first before pressure builds enough to move the poppet away from the seat. The 687 Series Check Valve maximum operating pressure of 125 psi covers a wide range of air and fluid applications. The 687 Check is a compact design with a light cracking pressure, high flow rate, and a positive seal at very low back pressure or slight vacuum. For higher cracking pressure applications, an embedded o-ring poppet is substituted for the standard elastomer disc poppet.

Example:

Body Material	Inlet End	Outlet End	Seal	Spring
White Filled Poly	1/4 FNPT	1/4 FNPT	Viton®	1 psi, O-ring

SMC Part Number: WFP CHK 694-4F4F-F,1# O-Ring

The flow arrow on the body will point from Inlet to Outlet. SMC Part Numbers are a description of the valve as read left to right, Inlet to Outlet.
Example: WFP CHK 694-4F4F-F,1# O-Ring = 1/4 FNPT Inlet x 1/4 FNPT Outlet

694 Series Options

Material Options	Black Polypropylene Body & Poppet White Polypropylene Body & Poppet
Seal Options	Buna-N, Ethylene Propylene, Fluoroelastomer (Viton®)
End Options	1/4 Female NPT X 1/4 Female NPT
Cracking Pressure	302 Stainless Spring - 1/3 psi (Standard), 1, 7 psi

SMC will quote alternate materials or customize our standard products when quantities ensure competitive pricing.

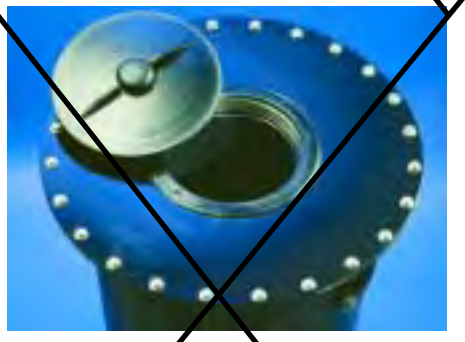
ECONOMY MOLDED PLASTIC TANKS

CYLINDRICAL TANKS, HEAVY-DUTY, CALIBRATED



NOTE: The tank weights and wall thicknesses listed in this section are approximate.

HINGED INSIDE COVER

- Made from Polypropylene sheet.
- Fits into top rim flange.
- Flexible long Polyolefin hinge.
- Provides 50% access when open (standard).
- Custom designs available.

FLAT BOLTED COVER

- 304 SS bolts, nuts, and washer.
- Vinyl gasket.
- Three bead welded joints.
- Flat Polypropylene sheet.
- Shown with optional threaded access port.

770.110.120 Covers

FEATURES

- Every tank on this page has rigid, extra-heavy walls to assure maximum strength and durability under severe conditions, making them ideal for a wide variety of applications. They can safely handle a variety of corrosive liquids. The visible liquid level and calibration in gallons allows for convenient reading of contents. The rim flange provides extra strength and ease of handling. The tanks are leak-proof and the one-piece construction eliminates seams, joints and welds, and cleaning is accomplished quickly and easily.

CYLINDRICAL TANKS, LINEAR POLYETHYLENE

- These rigid, self-supporting tanks have excellent resistance to chemicals, impact and abrasion. They withstand continuous operating temperatures up to 180˚F; intermittent service to 212˚F.

770.110.130 Linear PE

CYLINDRICAL TANKS, POLYPROPYLENE

- These products withstand continuous operating temperatures up to 230˚F, and have generally greater resistance to chemicals than the other tanks listed. However, they're not recommended for use at temperatures below freezing.

ORDER: 7120.(Size No.) CYLINDRICAL TANK, POLYPROPYLENE

INDUSTRIAL
WATER PROCESSING SYSTEMS

CENTRAL BRINE DRUM
INSTALLATION INSTRUCTIONS

Manufactured by:
Kinetico Incorporated
Newbury, OH 44065
440.564.9111

The pioneer in non-electric water processing systems.

CAUTION

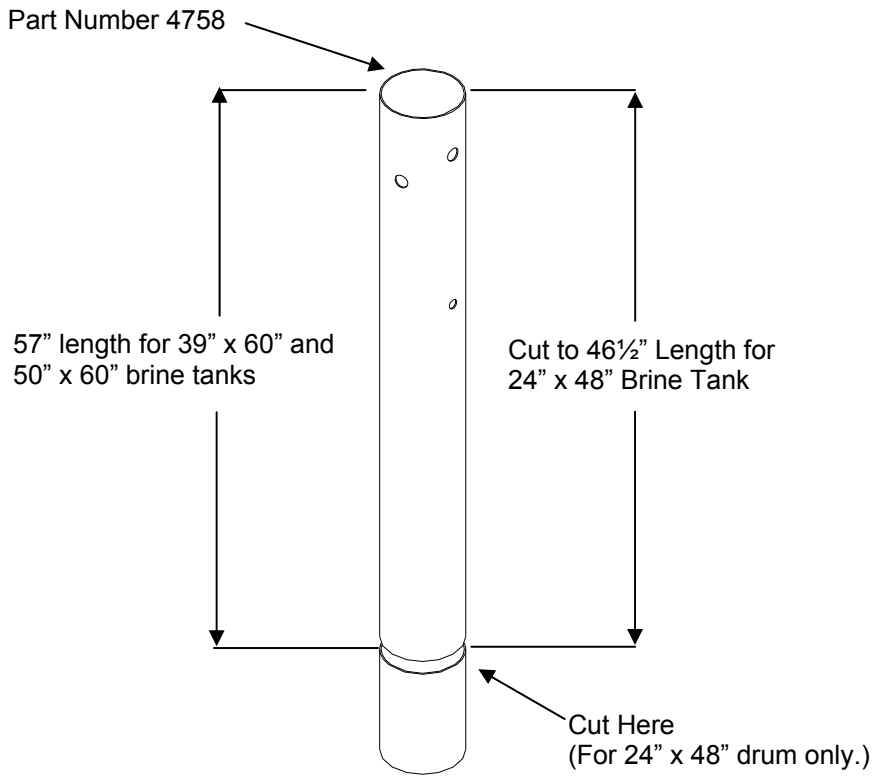
The central brine refill valve (part number 4967) has a maximum operating pressure of 80 psi (5.5 bar). If the system pressure exceeds 80 psi (5.5 bar), a pressure regulator must be installed on the central brine drum's refill line. Failure to do so will result in erratic brine valve operation, which can result in brine tank overflow, hardness breakthrough, and other issues.

Step 1 – Check contents. Before you begin the assembly, inventory all parts to be sure nothing is missing

Brine Drum	
#4724	24 x 48 w/Lid
#4726	39 x 60 w/Lid
#4728	50 x 60 w/Lid

Internals Assembly		
Part No.	**Description**	**Qty.**
1138	Elbow, Overflow	1
1139	Nut, Overflow	1
1869	C/B Screw, 10/32" x ½"	10
1870	C/B 3/8" PVC Coupling	1
2360	C/B Brass Collar	2
2361	C/B Brass Rod, 3'	1
2944A	C/B Bulkhead with Distributor	1
57054	C/B Bulkhead Fitting, ¾"	1
4967	C/B Brine Refill Valve, ¼"	1
3406	C/B Plastic Nipple	1
3407	C/B Plastic Elbow	1
3408	C/B Adapter, Float Rod	1
3430	C/B Brass Nut, 10/32"	10
3431	C/B Clamp, 3/8"	10
3793	C/B Cover, Brine Well	1
4731	C/B Float Ball 4½"	1
4756	C/B Tubing, 13' x 3/8" Drilled	1
4758	C/B Brine Well 5" x 57" Drilled	1
4759	C/B Plug ¾" JACO	1
4761	C/B Spray Tubing End Fitting	2
4762	C/B Plug ¼" JACO	1

Brine Drum	
#7737	22 x 36 w/Lid



Internals Assembly		
Part No.	**Description**	**Qty.**
7739	C/B Brass Rod 31" (22 x 36 only)	1
7740	C/B Brine Well 5" (22 x 36 only)	1

Step 2 – Cut brine well. If you are using 24" x 48" brine tank (part number 4724), you must shorten the brine well (part number 4758).

The brine well has a standard length of 57". For use with the brine tank (part number 4724), this length must be reduced to 46½".

Well is to be shortened on the opposite end of holes when necessary. Refer to Figure 1.

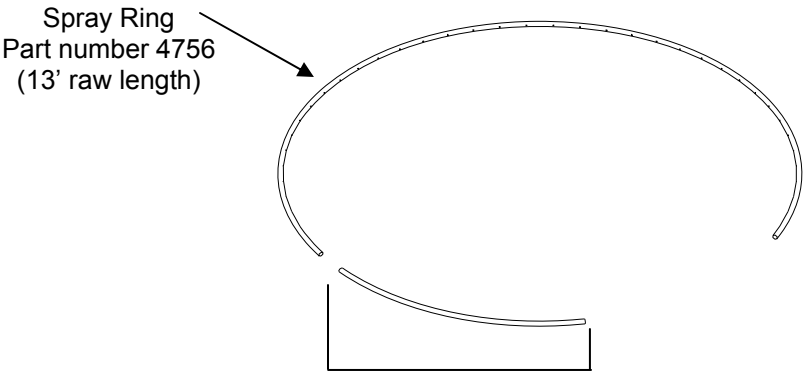


Figure 1

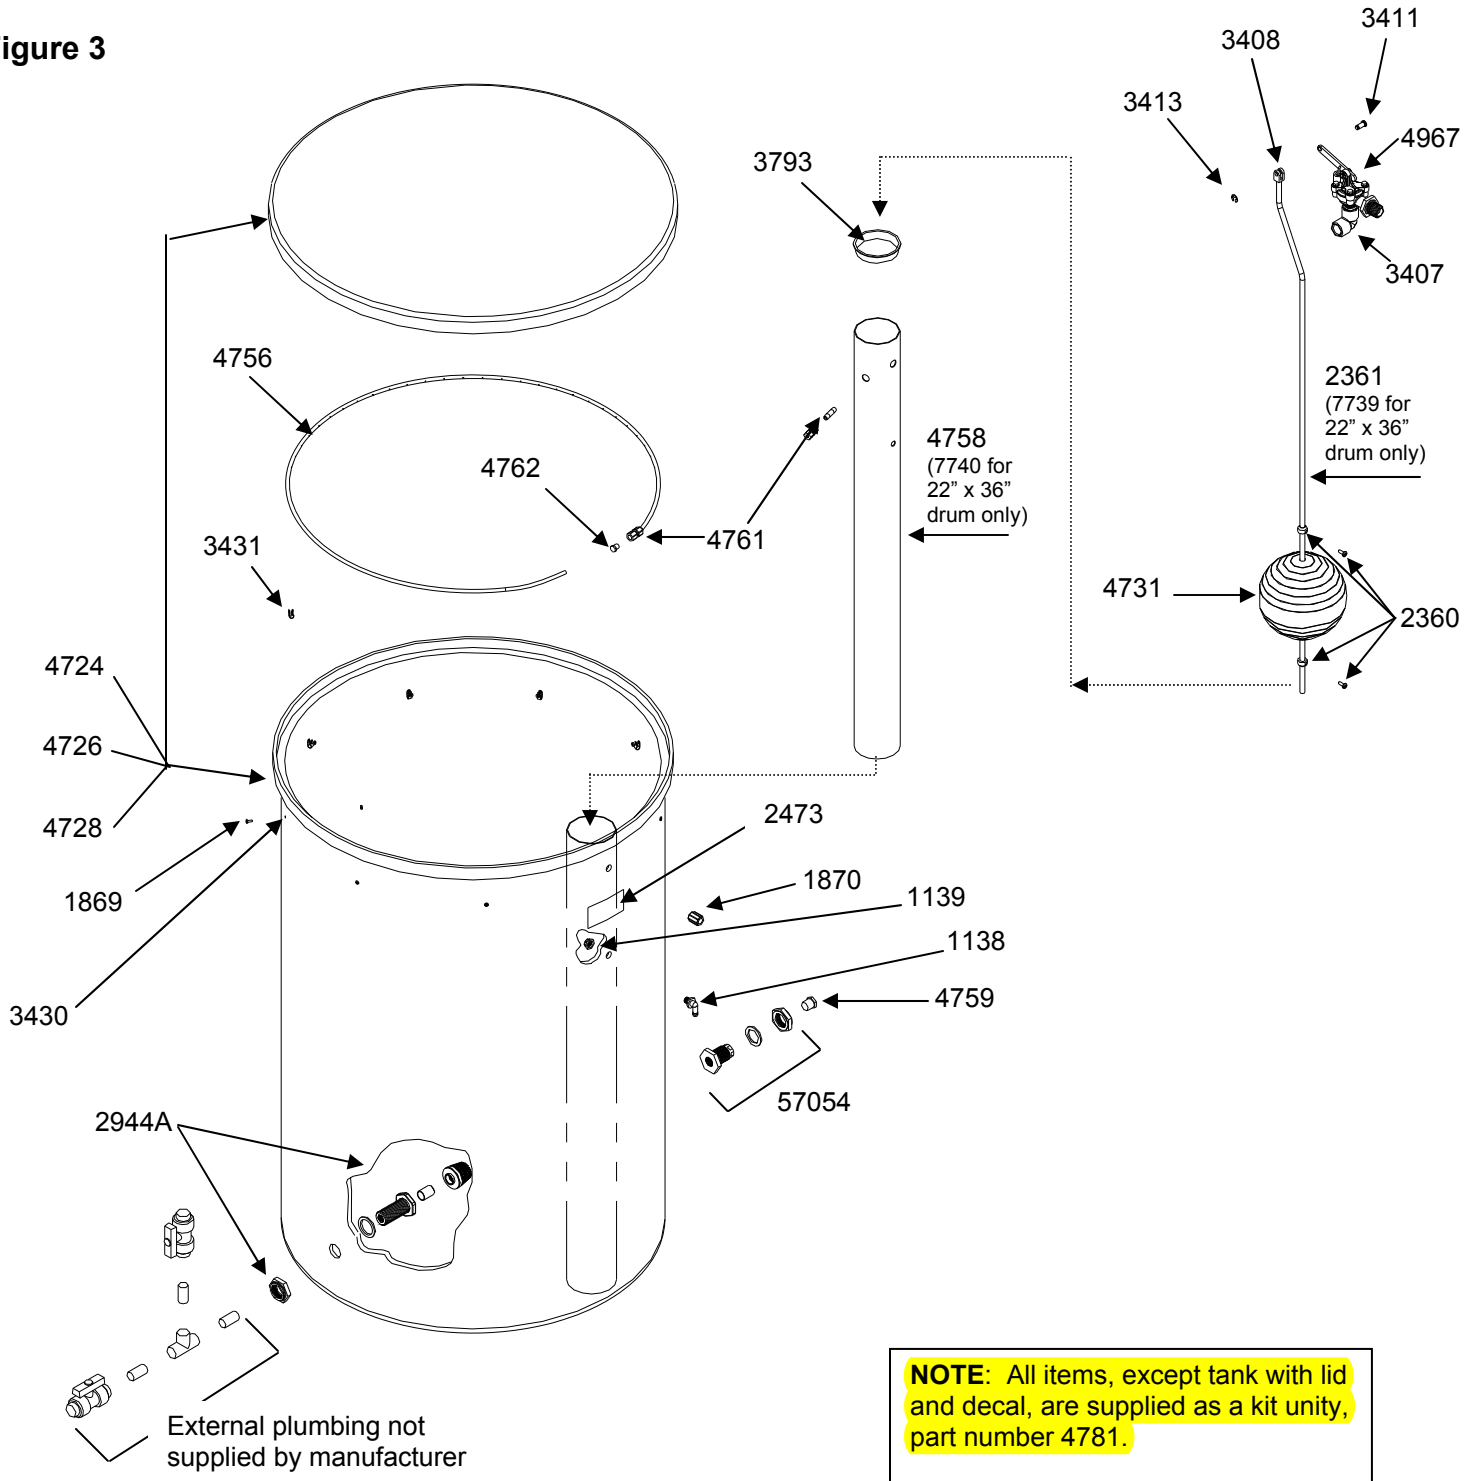
Step 3 – Cut the spray ring to proper length. See table below.

Brine Tank Size	Part Number	Spray Ring Length
22” Dia. x 36” H	7737	60” – 5’
24” Dia. x 48” H	4724	66” = 5’ 6”
39” Dia. x 60” H	4726	114” = 9’ 6”
50” Dia. x Height	4728	153” = 12’ 9”

Figure 2

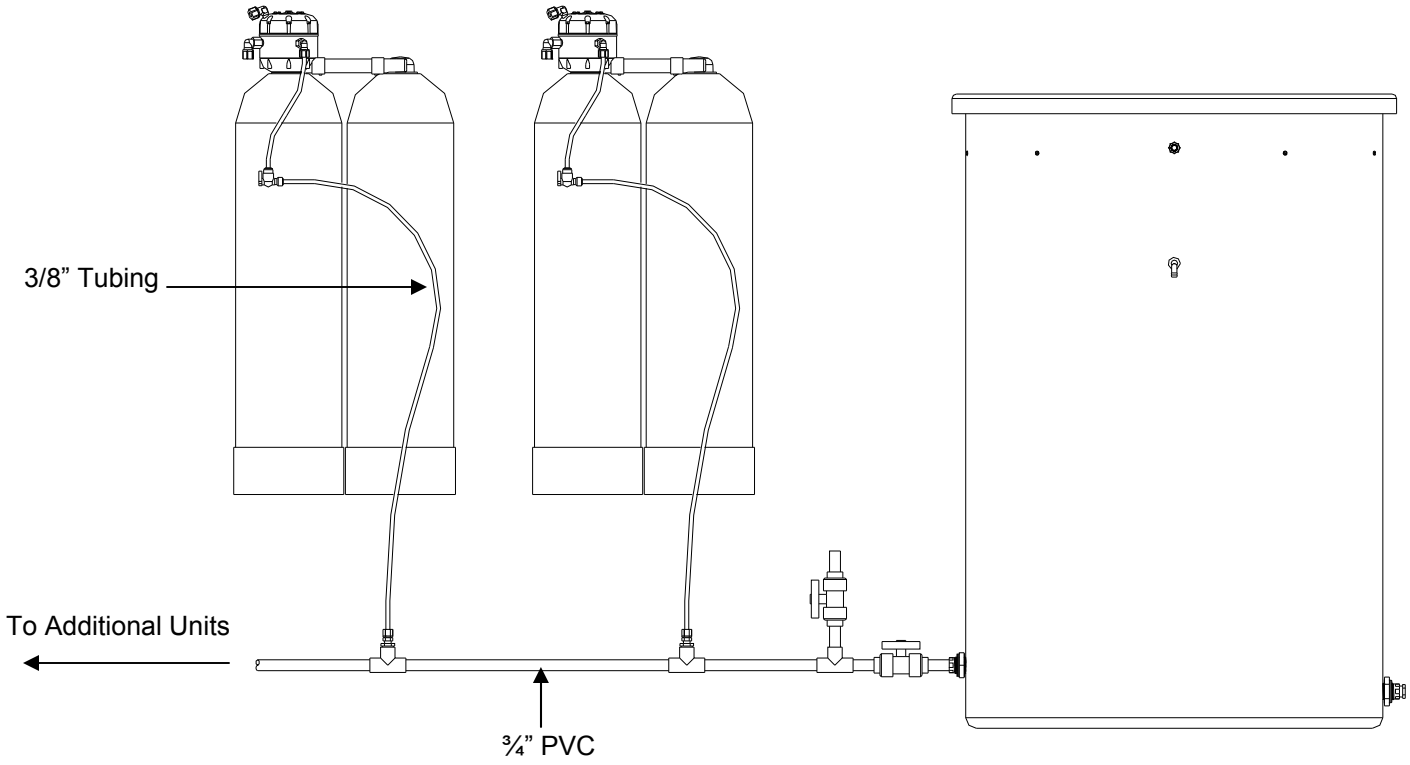


See chart above for length of spray ring to be cut from the 13 foot raw length.

Step 4 – Assemble the internals package and attach it into the brine drum as shown in Figure 3. Use detailed instruction sheet if required (Step 8).

NOTE: Be sure to place part number 57054 in the bottom hole on the brine tank. This is used for clean out purposes, so install plug (part number 4759), or add a shut-off valve. Part number 2944A should be inserted into the opening that is located 6” from the floor. This is the brine feed to the softeners. For 22” x 36” drum, install part number 2944A in either hole.

Figure 3

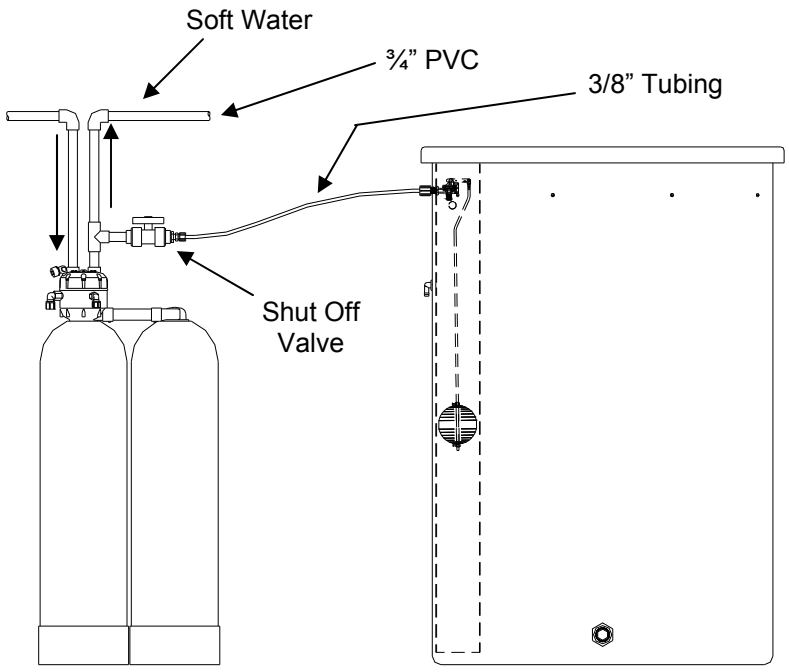


NOTE: All items, except tank with lid and decal, are supplied as a kit unity, part number 4781.

Use kit, part number 7742, when installing the 22 x 36 drum.

Step 5 – Brine Distribution Piping – The distribution piping from the brine tank to the brine check valve is not included with this system (refer to Figure 4). This represents our recommended layout for this piping.

Figure 4



Step 6 – Inlet Connection – When the brine discharge piping is complete, install a feed line to the brine spray valve. This feed line should connect to a soft water line. Refer to water softener instruction.

The inlet tubing and fittings are not part of the system. This represents our recommended layout for the system

Use flexible 3/8" tubing. Be sure to install a shut-off valve. Refer to Figure 5.

Figure 5

Step 7 – Start-up

1. Open inlet valve slowly.
2. Check spray valve for correct operation.
3. Let water level cover brine discharge fitting.
4. Shut off water.
5. Check brine discharge fitting for leaks.
6. Check clean-out fitting for leaks.
7. Add sale to spray ring opening.
8. Open inlet valve.

9. Water level should shut off approximately 24” down the brine well.

Step 8 – Detailed Assembly Instructions for Brine Drum Assembly

NOTE: Use teflon tape for all threaded pipe connections.

A. For 39” and 50” Diameter Drums

1. Assemble bulkhead fittings to brine drum as shown, with the rubber washer on the inside. Be sure the washer does not squeeze out while tightening.
2. Mount the brine well (part number 4758) to the drum using overflow fitting (part number 1138) and nut (part number 1139).
3. Assemble 90° elbow (part number 3407) and nipple (part number 3406) to refill valve (part number 4967)
4. Install top collar (part number 2360) on bent float rod and position it 14” from straight end and secure. Slide ball on rod. Position lower collar (part number 2360) on rod and secure it approximately 2” from end of rod. Top collar for 22” x 36” should be installed 9” from end of rod.
5. Screw float to valve adapter fitting (part number 3408) to float rod. DO NOT OVERTIGHTEN.
6. Using pin (part number 3411) and E-ring (part number 3413), attach rod and float assembly to valve (part number 4967) activator arm.
7. Lower float rod and valve assembly into brine well. Moiunt valve to tank through hole in brine well.
8. Assemble tube to nipple fitting (part number 4761) to nipple (part number 3406) through hole in the brine wall.
9. Connect spray tube (part number 3431) to fitting (part number 4761) leading to valve and add end plug fitting to spray tube. Plug fitting consists of hose to female thread fitting (part number 4761) and ¼” pipe plug (part number 4762).
10. Using the 8 hangers (part number 3431), screws (part number 1869) and nuts (part number 3430), mount spray tube to drum using holes provided. Spray holes should be angled down toward salt.

B. For 24” Drum

The procedures are identical to those listed, except the shorter 46½” brine well is used. Also, only 6 hangers are needed to mount the spray tube (part number 4756).

C. For 22” Drum

Same as above. Only difference is a different brine well is used (part number 7740).

THIS PAGE LEFT BLANK INTENTIONALLY

PVC & CPVC COMPACT 2000 BALL VALVES

CB2000-2-0604

Industrial Grade, Maintenance-Free Sealed Unit
New Lower-Profile, More Compact Design
Provides Even Greater Space-Savings

- New Actuation-Ready Body – Accepts Spears® Improved Mini-Mount Actuator Mounting Kits
- New Double O-ring Stem Seal
- Spears® Safe-T-Shear Stem
- PTFE Self Adjusting Floating Seats
- EPDM or Viton® O-ring Seals
- Full 235 psi Pressure Rating @ 73°F
- NSF Certified for Use with Potable Water
- Suitable for Vacuum Service
- Produced in ASTM IPS sizes 1/2" - 2" with Socket or Threaded End Connectors

Corrosion Resistant PVC or CPVC Construction, Silicone Free Assembly

Spears® Compact 2000 Ball Valves never rust, scale, or pit, providing exceptional chemical and corrosion resistance. Assembled with water soluble, silicone free lubricant.

Actuation-Ready Body Mounting Lugs

Valve body has built-in mounting lugs for direct attachment to Spears® improved Mini-Mount actuator mounting kits.

PTFE Ball Seats

Spears® PTFE floating seat design reduces seat wear for extended valve life, smooth operation, and bubble-tight shutoff. 100% factory tested.

EPDM or Viton® O-ring Options

Available with high grade, abrasion resistant EPDM or Viton® elastomer O-ring seals. Allows application specific selection for optimum chemical resistance.

High Impact Polypropylene Handle

Low profile, double stop design. Exhibits excellent resistance to most chemical environments.

Sample Engineering Specification

All thermoplastic ball valves shall be Compact 2000 sealed unit type manufactured to ASTM F 1970 and constructed from PVC Type I, ASTM D 1784 Cell Classification 12454 or CPVC Type IV, Cell Classification 23447. All Valve bodies shall have actuation mounting lugs. All O-rings shall be EPDM or Viton®. All valves shall have Safe-T-Shear® stem with O-ring stem seal and double-stop Polypropylene handle. All valves shall be listed by NSF International for use in potable water service. All 1/2" - 2" valves shall be pressure rated at 235psi, for water at 73°F, as manufactured by Spears® Manufacturing Company.

Full Schedule 80 Bore

In open position, full-bore provides optimum flow with pressure drop equal to that of an equivalent length of Schedule 80 pipe.

Suitable for Vacuum Service

Compact 2000 Ball Valves have been tested at 26 in-Hg. vacuum for one hour with less than 1-in. Hg loss.

NSF Certified for Potable Water

All Compact 2000 Ball Valves are NSF Certified for use in potable water systems.

Optional Accessories

- Round Safety Handle
- Stem Extension Kit
- Mini-Mount Actuation Mounting Kit (AMB3 Series)
- 2" Square/T-Style Operator Nut

NOT FOR USE WITH COMPRESSED AIR OR GASES

Spears® Manufacturing Company DOES NOT RECOMMEND the use of thermoplastic piping products for systems to transport or store compressed air or gases, or the testing of thermoplastic piping systems with compressed air or gases in above and below ground locations. The use of our product in compressed air or gas systems automatically voids any warranty for such products, and its use against our recommendation is entirely the responsibility and liability of the installer.

WARNING: DO NOT USE COMPRESSED AIR OR GAS TO TEST ANY PVC OR CPVC THERMOPLASTIC PIPING PRODUCT OR SYSTEM, AND DO NOT USE DEVICES PROPELLED BY COMPRESSED AIR OR GAS TO CLEAR SYSTEMS. THESE PRACTICES MAY RESULT IN EXPLOSIVE FRAGMENTATION OF SYSTEM PIPING COMPONENTS CAUSING SERIOUS OR FATAL BODILY INJURY.

Prices subject to change without notice. Possession of this price schedule shall not be construed as an offer to sell the products listed. Product drawing(s) and/or photograph(s) are representative and may not fully reflect product configuration.

PVC & CPVC UTILITY BALL VALVES

UT-2-1101

Economy, Utility and Quality

A high quality, economical, quarter-turn shut off valve designed for irrigation, pool and spa applications. Available in IPS sizes 1/2" through 4", with choice of either socket or threaded end connectors, plus 6" socket.

PVC or CPVC Construction
Excellent companion for PVC systems such as lawn sprinklers, pools, spas, water gardens and other light-duty applications.

One-Piece Sealed Unit
Never requires adjustment.

Teflon® Ball Seats
Smooth operating PTFE floating seat design reduces wear.

EPDM O-ring Seals
High grade, abrasion resistant EPDM elastomer O-rings.

Full Schedule 80 Bore
In full open position, full bore virtually eliminates pressure drop, providing optimum flow.

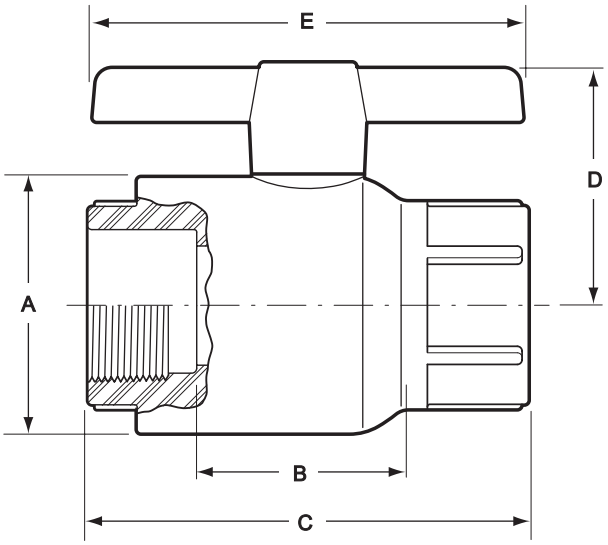
High Impact Polypropylene Handle
Features double-stop engagement.

Safe-T-Shear® Stem
Developed to help prevent line fluids from leaking out in the event of ball valve stem damage. Engineered for high strength, the stem incorporates a special shear point to control accidental breakage. Over-torquing breaks occur above the stem O-ring leaving the seal intact until replacement can be made.

150 psi Pressure Rating
Maximum Internal Pressure at 73°F for a variety of applications.

Certified by NSF for Potable Water
All Utility Ball Valves are Certified by NSF International for potable water use.

For additional information, please refer to Spears® THERMOPLASTIC VALVES & ACCESSORIES PRODUCT GUIDE & ENGINEERING SPECIFICATIONS, V-4 and THERMOPLASTIC VALVES & ACCESSORIES Price Schedule V-1.



Sample Engineering Specifications
All thermoplastic ball valves shall be Utility sealed unit type constructed from PVC Type I Cell Classification 12454 or CPVC Type IV Cell Classification 23447. All O-rings shall be EPDM. All valves shall have Safe-T-Shear® stem and double stop Polypropylene handle. All valves shall be listed by NSF for use in potable water service. All valves shall be pressure rated at 150 psi for water at 73°F, as manufactured by Spears® Manufacturing Company.

OXIDANT TANK - SINGLE
100 GALLONS
GA DRAWING

DESIGNED BY: T.EDWARDS	DATE: 11/19/2008	DRAWING NO: 500-00291_02
APPROVED BY:	DATE:	

CAUTION

- NO SMOKING, OPEN FLAMES, OR ANY OTHER IGNITION SOURCES IN THE VICINITY OF THIS TANK OR VENT
- PERMIT REQUIRED CONFINED SPACE, USE CONFINED SPACE PROCEDURES PER OSHA STANDARD 1910.146
- DO NOT ADD OTHER CHEMICALS TO THE TANK OR VENT
- REFER TO MIOX OPERATOR'S MANUAL FOR OTHER SAFETY RELATED PRECAUTIONS

This Tank or Vent May Contain	**Statement of Hazards**
• Hydrogen Gas with a Hazard Rating Identification of (0-4-0-Null)	• Flammable Gas present • Fire & Explosion Hazard present • Simple Asphyxiate Gas present
• Dilute (<1% by volume) Sodium Hypochlorite Solution with a Hazard Rating Identification of (2-0-1-Null)	• Moderate Health Hazard present • Incompatible and/or hazardous reactions can occur with addition of other chemicals, such as strong acids, strong reducing agents, amines, ammonium salts, metals, methanol, phenylacetonitrile, formic acid, and ammonia

Miscellaneous Storage Tanks

Industrial Mini Bulk (IMB) and Industrial Mini Drum tanks (IMD) are molded in either high density crosslink polyethylene or NSF Certified linear polyethylene. Molded polyethylene skids are optional for both IMB 120 and 200 models. These skids allow the tank to be lifted and re-located during non-use periods. The IMD series tanks have molded in baffles and forklift access.

Model Number	Capacity (US Gallons)	Dimensions (inches)		Weight (lbs) 1.9 Sp. Gravity		Access Opening (inches)
		Diameter	Height	Linear Polyethylene	Crosslinked Polyethylene	
IMB 120	120	40	30	40	40	6
IMB 200	200	40	44	50	50	6
IMB-Pallet	--	--	4	40	40	--
IMD 110	110	37	32	35	35	6
IMD 175	175	37	45	50	50	6

Open Top Tanks

Industrial Open Top tanks (IOT) are molded from your choice of virgin high density cross-link or NSF certified linear polyethylene. These flat bottom vertical tanks are molded with a stiffening lip on the top to give the tank rigidity, and they are equipped with shoe-box style cover. Assmann open top tank covers have a unique design that allows the lid to be hinged and stay open. Available in a variety of colors and in sizes ranging from 30 to 680 gallons. As an option for these tanks, Assmann offers both stainless steel and mild steel epoxy coated agitator support stands.

Model Number	Capacity (US Gallons)	Dimensions (inches)		Weight (lbs) 1.9 Sp. Gravity		Access Opening (inches)
		Diameter	Height	Linear Polyethylene	Crosslinked Polyethylene	
IOT 30	30	19	30	18	18	Open top
IOT 40	40	18	41	27	27	Open top
IOT 55	55	22.375	37.5	30	30	Open top
IOT 70	70	22	46	33	33	Open top
IOT 90	90	24	50	42	42	Open top
IOT 150	150	30	51	55	55	Open top
IOT 210	210	35	52	65	65	Open top
IOT 300	300	42	57	95	95	Open top
IOT 400	400	69	32	120	120	Open top
IOT 680	680	69	48	130	130	Open top

Double Wall Base Containers

Rectangular, low profile, chemical storage tank for various material handling applications. Features a primary tank that holds 450 US gallons, allowing intermediate bulk containers (IBC) to be quickly emptied and back on the road. Constructed from crosslink polyethylene or FDA approved and NSF Certified linear polyethylene.

Model Number	Capacity (US Gallons)	Dimensions (inches)			Weight (lbs) Linear and Crosslinked Polyethylene		Access Opening (inches)
		Width	Length	Height	1.9 Sp. G	2.2 Sp. G	
BC 450	450	73	73	44	802	N/A	11

Gallonage and weights are approximate.

PVC & CPVC TRUE UNION 2000 VALVES

TU2000-2-0605

One of the Most Versatile, Compact Valve Designs Available

Spears® True Union 2000 Ball Valves, 3-Way Ball Valves and Ball Check Valves provide maximum versatility with fully interchangeable valve cartridges. Provides for easier system design modifications and upgrades in multiphase projects, or anywhere changes in valve types are desired. Simply exchange any True Union 2000 valve in-line using existing union nuts. Also mates with Spears® new Schedule 80 Unions and Diaphragm Valves. All True Union 2000 valves feature a low profile, compact design for minimal space requirements. Available in PVC or CPVC with choice of EPDM or Dupont Dow Genuine Viton® O-ring seals and socket, flanged, or optional Spears® patented Special Reinforced (SR) threaded end connectors. Additionally, Spears® offers valve Retrofit Kits for easy in-line replacement of other valves and factory installed Actuation Packages. Assembled with silicone-free lubricant.

True Union 2000 Industrial Ball Valve

- Multi-featured Industrial Grade
- Built-in Handle Lockout
- Fully Serviceable, Replaceable Components
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- ISO Pattern Actuation Mounting Option
- Spears® Dual O-ring Safe-T-Shear® Stem
- Self Adjusting PTFE Floating Seat Design
- Sizes 1/2” - 2” pressure rated to 235 psi @ 73°F, sizes 2-1/2” - 6” and all flanged to 150 psi @ 73°F
- NSF Certified for Potable Water Use
- Also Available in **SPEARS® LXT™** High Purity, Low Extractable PVC Material
- Produced in IPS sizes 1/2” - 6” with Socket, Flanged or SR Threaded End Connectors

True Union 2000 Industrial 3-Way Valve

- Industrial Grade, Multiport, Diverter, L-Pattern & T-Pattern configurations Vertical 3-Way or Horizontal Diverter (shown)
- Built-in Handle Lockout
- Fully Serviceable, Replaceable Components
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- ISO Pattern Actuation Mounting Option
- Spears® Dual O-ring Safe-T-Shear® Stem
- Self Adjusting PTFE Floating Seat Design
- Sizes 1/2” - 2” pressure rated to 235 psi @ 73°F, sizes 2-1/2” - 4” and all flanged to 150 psi @ 73°F
- NSF Certified for Potable Water Use
- Produced in IPS sizes 1/2” - 4” with Socket, Flanged or SR Threaded End Connectors

True Union 2000 Industrial Ball Check Valve

- Industrial Grade
- Flow-Tested for Minimum Turbulence
- Fully Serviceable, Replaceable Components, uses Standard O-ring Seat
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- Easily Converted to Foot Valve
- NSF Certified for Potable Water Use
- Also Available in **SPEARS® LXT™** High Purity, Low Extractable PVC Material
- Sizes 1/2" - 2" pressure rated to 235 psi @ 73°F, sizes 2-1/2" - 6" and all flanged to 150 psi @ 73°F
- Produced in IPS sizes 1/2" - 6" with Socket, Flanged or optional SR Threaded End Connectors
- Also available in PVC White

Check Valve Size	1/2	3/4	1	1-1/4	1-1/2	2	2-1/2	3	4	6

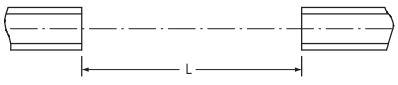
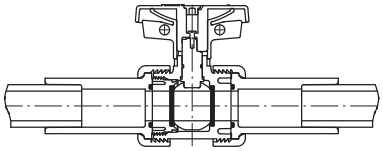
Economical True Union 2000 Standard Ball Valve

- High quality Standard Ball Valve
- Allows future system upgrade
- Excellent for OEM Applications
- Replaceable Seats
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- Spears® Safe-T-Shear® Stem
- Self Adjusting Floating Seat
- Sizes 1/2" - 2" pressure rated to 235 psi @ 73°F, sizes 2-1/2" - 4" and all flanged to 150 psi @ 73°F
- NSF Certified for Potable Water Use
- Produced in IPS sizes 1/2" - 4" with Socket, Flanged or SR Threaded End Connectors
- Also available in PVC White



True Union 2000 Retrofit Valves or Kits



Easily converts any system over to all True Union 2000 style valves for consistent valve type and uniform maintenance. Special extended socket style End Connectors (2) allow retrofit replacement of other brand valves in existing piping systems with a new True Union 2000 valve. Simply cut out old valve according to specified dimension and install retrofit end connectors. End connectors are provided with either EPDM or genuine Viton® O-rings. Can be ordered as End Connector Kit or fully assembled Retrofit Valve.

3-Way Port Options

True Union 2000 Actuated Valves

Universal ISO Actuator Mounting Pattern Option

Spears® offers optional actuator mounting with standard ISO Mounting Pattern for user actuation of True Union 2000 Ball Valves.

Factory Actuated Valve Packages

Spears® Electric or Pneumatic Actuation Packages eliminate customer's having to determine proper valve and actuator mating. Pre-matched packages insure proper torque, coupling and mount for optimum performance - all factory installed and tested for proper alignment and operation. Actuation packages can be custom built to user specifications from Spears® wide selection of options, voltages and accessories. Contact Spears® for additional information.

Foot Valve Screens

- Easily converts Ball Check Valve to a Foot Valve.
- Standard IPS spigot connection fits slip-socket valve end connector.
- Enlarged screen provides open area equivalent to valve for optimum flow characteristics.
- Chemical and corrosion resistant PVC or CPVC construction.

Typical Application (VALVE NOT INCLUDED)

Split Nut Kit for True Union 2000 Valves & Union 2000 Schedule 80 Fittings

Split Nut Kits are designed to replace broken union nuts on Spears® True Union 2000 Ball Valves and Union 2000 Schedule 80 Unions. Kit includes SS316 Gear Clamp and 2-Split Nut halves. Can also be used if nut was not in place during end connector installation. Split Nut is fully serviceable to original valve pressure rating.

NOT FOR USE WITH COMPRESSED AIR OR GASES

Spears® Manufacturing Company DOES NOT RECOMMEND the use of thermoplastic products to transport or store compressed air or gas.

Viton® is a registered trademark of DuPont Dow Elastomers

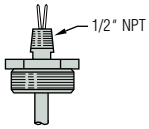
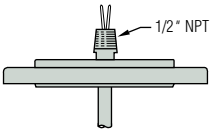
Large Size – Engineered Plastics

LS-800PVC Series – Our Most Economical Large Size Unit

- NSF Approved All-PVC Wetted Parts Available
- 1 to 7 Actuation Levels
- Lengths to 60 inches





Inexpensive, all-PVC LS-800PVC Series switches bring reliable level sensing to corrosive liquids. These durable, yet economical, switches use the same high-quality, dependable reed switches found in GEMS' most expensive models. NSF-approved wetted parts make the LS-800PVC suitable for potable water applications.

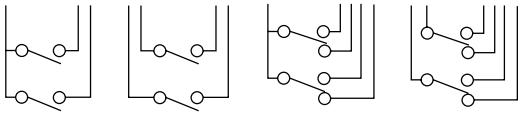
LS-800PVC Series – Continued



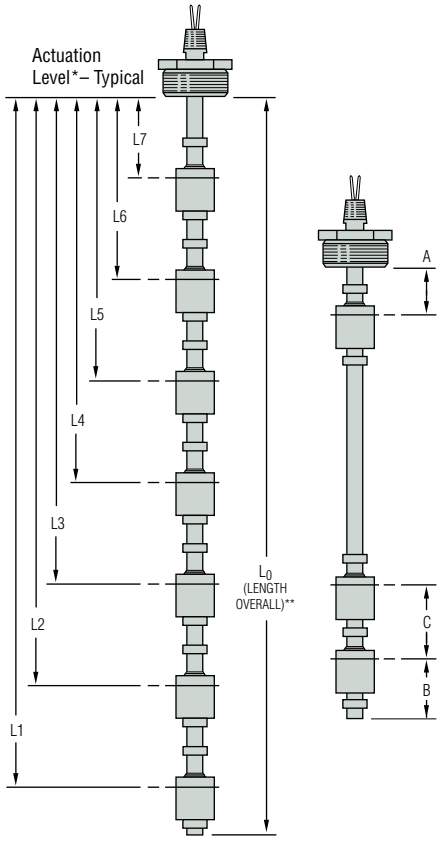
3. Number of Actuation Levels and Electrical Specifications

Typically, one float is required for each point at which you need a switch action to occur. The number of actuation levels available depends on type of wiring selected. See below.

Group I Wiring: 1 to 7 Actuation Levels
Group II Wiring: 1 to 4 Actuation Levels
Group III Wiring: 1 to 3 Actuation Levels
Group IV Wiring: 1 to 2 Actuation Levels
Switch (N.O. or N.C.):
SPST: 20 VA or 100 VA
SPDT: 20 VA
Lead Wires: #22 AWG, 24˝ L., PVC

Typical Wiring Diagrams
For clarity, only two actuation levels are shown in each group diagram.

GROUP I SPST | GROUP II SPST | GROUP III SPDT | GROUP IV SPDT



Wiring Color Code

SPST Switches				SPDT Switches 20 VA				
Wiring	**Group I**	**Group II**		**Group III**		**Group IV**		
Com. Wire	Black	None		Black		None		
	NO/NC	SW. Com.	NO/NC	NO	NC	SW. Com.	NO	NC
L1	Red	Red	Red	Red	Wh/Red	Red	Wh/Red	Wh/Blk/Red
L2	Yellow	Yellow	Yellow	Yellow	Wh/Yel	Yellow	Wh/Yel	Wh/Blk/Yel
L3	Blue	Blue	Blue	Blue	Wh/Blue			
L4	Brown	Brown	Brown					
L5	Orange							
L6	Gray							
L7	White							

Notes: See “Electrical Data” on Page X-5 for more information.

4. Actuation Level Dimensions

* Actuation level distances and L_0 (overall unit length) are measured from inner surfaces of mounting plug or flange.
** Length Overall (L_0) = L_1 + Dimension B. See Mounting Types for Maximum Length values.

Switch actuation levels are determined following the guidelines below.

A = 1-1/2˝ (38.1 mm) Minimum distance to highest actuation level.

B = 2˝ (50.8 mm) Minimum distance from end of unit to lowest actuation level.

C = 3˝ (76.2 mm) Minimum distance between actuation levels.

Notes:
1. Actuation levels are calibrated on descending fluid level, with water as the calibrating fluid, unless otherwise specified.
2. A and B dimensions based on a top mounted unit.
3. Float stops are permanently cemented in place.
4. Tolerance on actuation levels is ±1/8˝ (3.2 mm).
5. Dimensions based on a liquid specific gravity 1.0.

CL17 Chlorine Analyzer

Reliable, economical chlorine control

The Hach CL17 Chlorine Analyzer uses colorimetric DPD chemistry to continuously monitor water for free or total residual chlorine. This low-cost analyzer provides a dependable and economical alternative to instruments that rely on costly electrodes or complex procedures. Unaffected by even large swings of pH, the CL17 performs an analysis every 2.5 minutes, 24 hours a day.

The CL17 offers both an alarm for manual chlorine feed control and a 4-20 mA output for automatic control of chlorine feed pumps for drinking water, wastewater and other water applications. Set for manual control, the instrument notifies the operator of out-of-limit chlorine levels – and allows manual intervention in the disinfection process as needed. The CL17 can be set for automatic control of chlorine feed pumps using one of two methods:

1) *On-Off Control* – which turns the feed pumps on when chlorine levels fall too low for disinfection, off when levels rise above a pre-set limit;
2) *Proportional Control* – which controls the amount of chlorine in proportion to the strength of the CL17's output signal. This is done through the REC MIN and REC MAX keys. For automatic operation, the CL17 has one output control with a range of 4-20 mA, programmable over any portion of the instrument's 0-5 mg/L range.

The unit is housed in an ABS plastic case that is lightweight, shatterproof and corrosion-resistant. The case includes built-in mounting brackets that simplify installation. Two windows clearly show chlorine measurements, alarms and reagent levels. A hinged door allows quick access to internal components.

The CL17 is designed to operate continuously for up to 30 days without replacing reagents or cleaning the sample cell. Because of its low reagent use, low maintenance requirement and its ability to prevent overfeeding, the CL17 is exceptionally cost-efficient.

Applications – water, wastewater and more

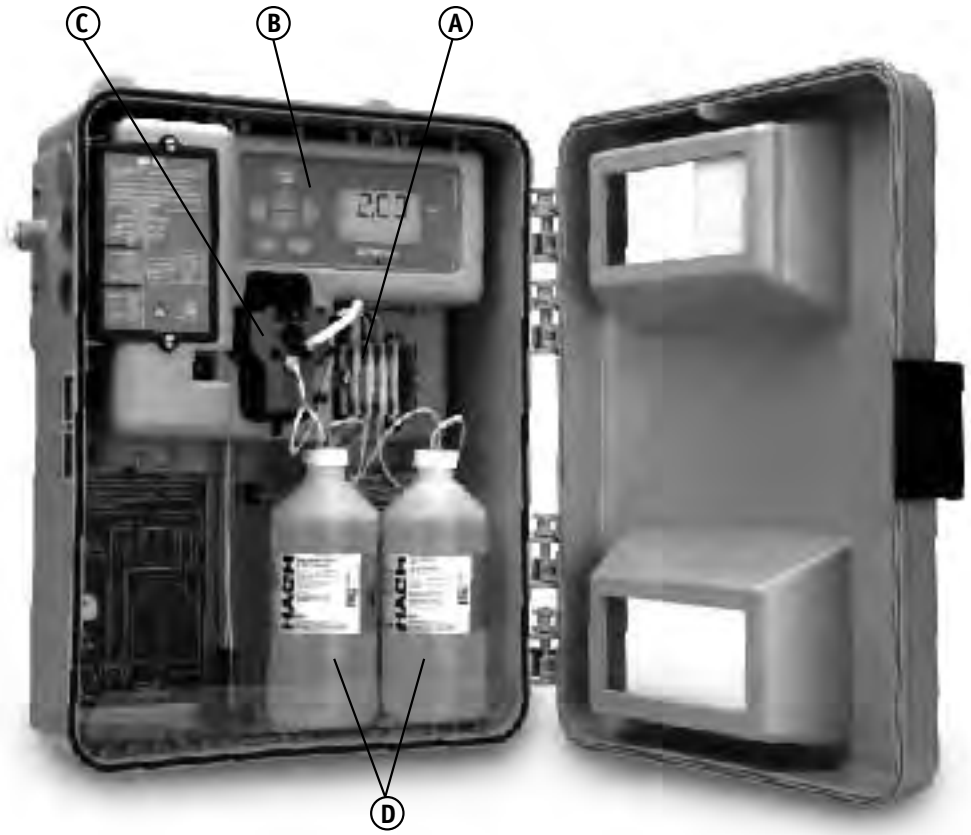
For drinking water applications, the CL17 can be used to monitor the raw water stage to facilitate preoxidation, disinfection and the control of taste and odor problems. It can also be used at the finished water stage, where residual chlorine levels must be maintained during the distribution phase. For wastewater applications, the CL17 has large tubing and fittings along with a Self-Cleaning By-Pass Y-Strainer Kit to ensure continuous operation without clogging.

Because it can be used to monitor disinfection – and help prevent biological build-up – the CL17 is also ideal for applications involving chemical or industrial process or feed water (e.g., textile and paper mills), heating and cooling water or food and beverage applications. In systems using reverse osmosis, the CL17 can help protect expensive cellulose acetate membranes through continuous monitoring of chlorine.

Fast, dependable operation

The CL17's internal pump, seal-free mixer and compact colorimeter combine to deliver reliable, low-maintenance operation – around the clock, seven days a week. The instrument's easy-to-clean sample cell and quick-access reagent chamber allow users to perform routine maintenance in 15 minutes or less per month (difficult samples may require more frequent cleaning). The CL17 is equipped with self-testing diagnostics and alarms that activate in the event of system problems or shut-down.

The Hach CL17 Chlorine Analyzer



- Colorimetric DPD chemistry – fast, reliable, economical
- Unattended operation up to 30 days
- Manual *or* automatic feed pump control
- Large tubing, strainer ideal for wastewater applications
- Low operating cost – no electrodes, minimal reagents, no risk of overfeeding

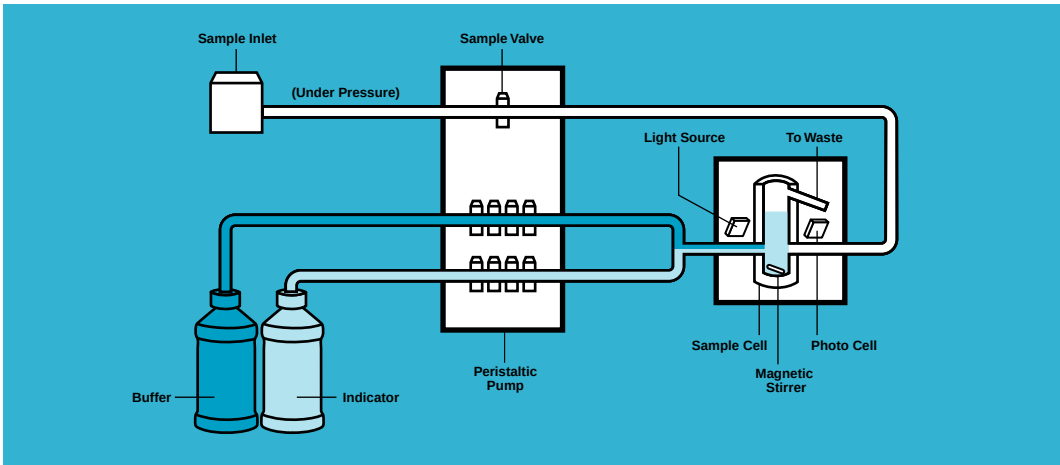
THERE'S ONLY ONE WAY TO BE SURE

Principle of operation

The CL17 Chlorine Analyzer consists of five main components – a linear peristaltic pump (A); a menu-driven LCD display that presents easy-to-read, scrolling messages explaining system status and operation (B); a colorimeter with a seal-free, solid-state mixing system* that includes a self-cleaning stir bar (C); and a one-month supply of reagents (D); all housed in a corrosion-resistant ABS, IP62 plastic case.

**Patent pending.*

Programming, set-up and manual diagnostics are simple with the CL17's keypad menu options. With a programmable 4-20 mA output, recorder options include the flexibility to set the limits to be output to a variety of devices such as a chart recorder, PLC or SCADA.



For further flexibility in data output, the CL17 is also available in an AquaTrend Network-ready configuration. (See How To Order for details.)

The linear peristaltic pump precisely controls the volume of incoming samples and reagents. The first sample is used to establish a zero reference point by measuring blank absorbance – compensating for the sample's color intensity and turbidity before the chlorine measurement is taken. Indicator and buffer reagents are added, a magnetic stirrer mixes the solution, and color development takes place. A compact colorimeter measures the light transmitted through the sample and compares the resulting color intensity to a reference standard.

The sample cell is then flushed with new sample, allowing the cycle to repeat itself every 2.5 minutes. An LED alarm can signal an out-of-limit sample concentration. The CL17's output can also be used to trigger external chlorine feed pumps, which automatically adjust chlorine injected into the system.

Method of analysis

The CL17 Chlorine Analyzer uses an aqueous buffered colorimetric indicator – N,N-diethyl-*p*-phenylenediamine (DPD) – to determine levels of chlorine. DPD turns a magenta color in response to the amount of free residual chlorine (as hypochlorous acid or hypochlorite ion). This reaction takes place at a buffered pH of 6.3 to 6.6. By simply changing reagents, the CL17 also measures *total* residual chlorine (free residual chlorine plus mono-, di- and trichloramines). This is done by adding potassium iodide to the sample – chloramines in the sample oxidize iodide to iodine, which then oxidizes the DPD indicator to the magenta color at a buffered pH of 5.1.

CL 17 Chlorine Analyzer Specifications*

Range
0 to 5 mg/L free or total residual chlorine

Accuracy
±5% or ±0.035 mg/L as Cl_2, whichever is greater

Precision
±5% or 0.005 mg/L as Cl_2, whichever is greater

Minimum Detection Limit
0.035 mg/L

Cycle time
One complete sample analysis every 2-1/2 minutes

Sample Conditioning
Inlet Pressure
1 to 75 psig

Sample Flow Required
200 mL per minute minimum flow rate required

Sample Temperature Range
5°C to 40°C

Operating Temperature
5°C to 40°C

Operating Maximum Humidity
90% at 40°C

Interferences
Other oxidizing agents such as bromide, chlorine dioxide, permanganate and ozone will cause a positive interference. Hexavalent chromium will cause a positive interference: 1 mg/L Cr6+ = approximately 0.02 mg/L as Cl_2
Hardness must not exceed 1,000 mg/L as $CaCO_3$

Recorder Outputs
One 4-20mA with an output span programmable over any portion of the 0 to 5 mg/L range
130 V isolation from earth ground

Alarms
Two alarms selectable for sample concentration alarm, analyzer system warning or analyzer system shut-down alarm; each is equipped with an SPDT relay with contacts rated for 5A resistive load at 230 VAC

Optional External Outputs
AquaTrend Network interface

Power
100-115/230 VAC 50/60 Hz (switch selectable), 90 VA maximum

Sample Inlet Connection
1/4-inch OD tube, quick-disconnect fitting

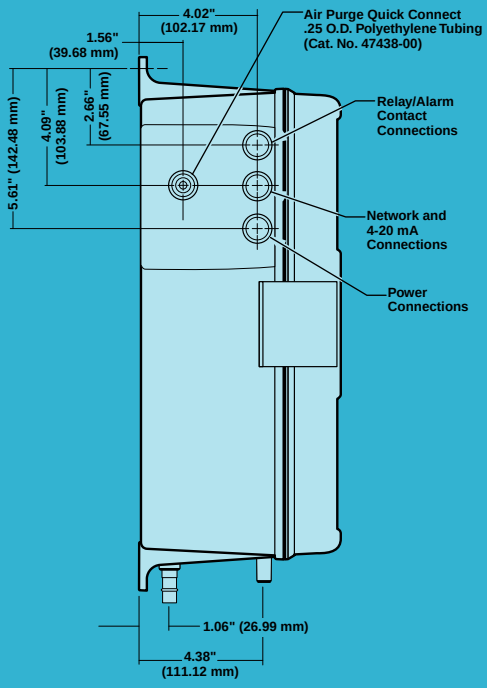
Drain Connection
1/2-inch ID flexible hose

Air Purge (optional)
1/4-inch OD tube, quick-disconnect fitting, 0.1 cfm instrument quality air at 20 psig maximum

Certification
CE approved
ETL listed to UL 1262
ETL certified to CSA 22.2 No. 142

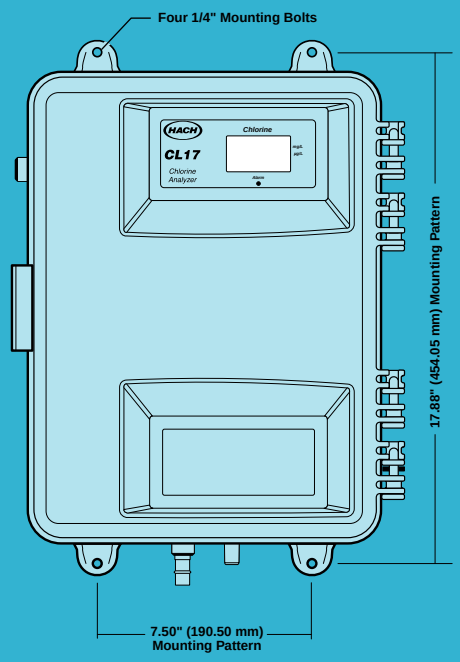
Enclosure
ABS plastic, IP62 enclosure rating with two clear polycarbonate windows

Dimensions
Approximately 16.5" tall, 12.5" wide, 7" deep



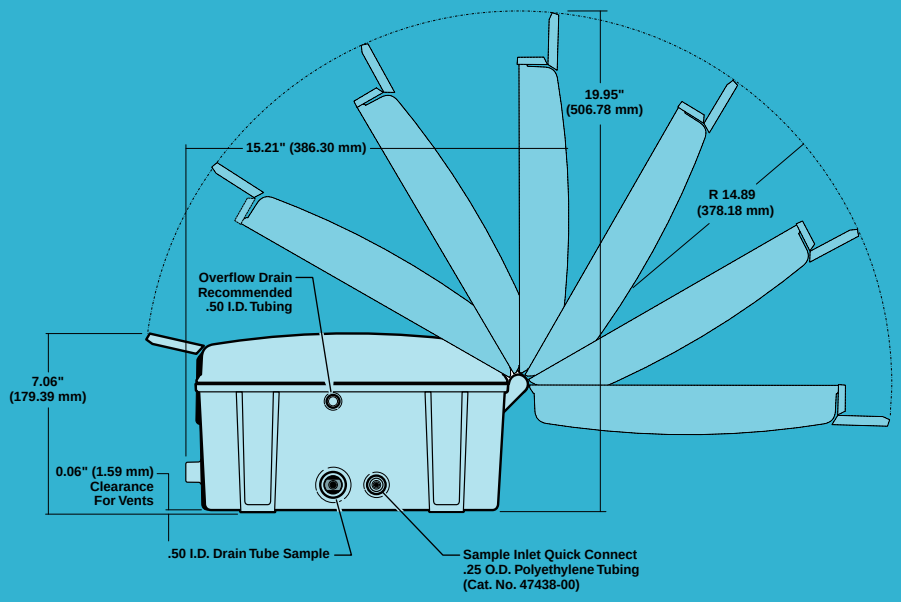
Mounting
Wall mount

Shipping Weight
25 lbs. (11.3 kg)



**Subject to change without notice.*

Installation



The CL17 is designed to be wall-mounted in minutes with four 1/4-inch screws. Adequate clearance must be left at the sides and bottom of the case for plumbing and electrical connections. The sample inlet connection is 1/4-inch quick-disconnect fitting and the drain connection is 1/2-inch I.D. flexible hose. Electrical connections are inside the instrument case. Holes for three 1/2-inch conduit fittings are provided.

How to Order

Hach CL17 Chlorine Analyzers are shipped with a one-month supply of reagents, spare pump tubing, a wall mounting kit and manual. The power cord is ordered separately.

Call Hach today to order the CL17 Chlorine Analyzer for your application.

Catalog #	CL17 Analyzer Model
54400-01	Model CL17 Free Residual Chlorine Analyzer
54400-02	Model CL17 Total Residual Chlorine Analyzer
54400-03	Model CL17 Free Residual Chlorine Analyzer with AquaTrend Network Capability
54400-04	Model CL17 Total Residual Chlorine Analyzer with AquaTrend Network Capability

Accessory

46964-00	Power Cord, 125V, 10A, 1.83 m (6')
47439-00	Power Cord, 230V, 10A, 1.83 m (6') Continental European plug
54443-00	Maintenance Kit* (1 year)
54443-01	Maintenance Kit with pre-assembled tubing* (1 year)
46436-00	Flow Meter with 1/4-inch OD tubing
44278-00	Serial I/O Kit (optional)

Additional Reagents

One unit each of three reagents (DPD indicator powder**, indicator and buffer solutions) is sufficient for 30 days of operation. Reagent sets include all three of the required reagents, sufficient for a 30-day operating period.

Catalog #	Reagent
25569-00	Reagent Set, Chlorine Free CL17
25570-00	Reagent Set, Chlorine Total CL17
22972-55	DPD Indicator Powder (free and total)
23140-11	Free Chlorine Indicator Solution, 473 mL
23141-11	Free Chlorine Buffer Solution, 473 mL
22634-11	Total Chlorine Indicator Solution, 473 mL
22635-11	Total Chlorine Buffer Solution, 473 mL

* Kit includes tubing, caps, funnel and fittings.
**DPD indicator powder is added to indicator solution.

Typical Proposal Specification

The chlorine analyzer shall employ a DPD colorimetric method of measurement using DPD indicator and a buffer solution and be capable of measuring free or total residual chlorine by changing the indicator and buffer solutions. A measurement shall be taken every 2.5 minutes and results displayed by a three digit LCD readout in the range of 0 to 5 mg/L. The analyzer shall be designed for 30-days unattended operation and use only 473 mL of each reagent per month.

Oper ating with an LED light source with a peak wavelength of 510 nm, the instrument shall be constructed to measure a sample blank before each sample measurement to provide automatic zero reference to compensate for sample color and turbidity and changes in light intensity due to voltage fluctuations or light source aging. The instrument shall provide a minimum detection limit of 0.035 mg/L or better, precision better than ±5% or 0.005 mg/L as Cl_2, accuracy better than ±5% or 0.035 mg/L as Cl_2.

The analyzer shall be microprocessor-controlled and provide a 4-20 mA recorder output as well as 2 alarms. Each alarm is user-selectable for sample concentration alarms (high or low), analyzer system warnings, or analyzer system shut-down alarms. The sample concentration alarms shall be fully adjustable through the entire range. The system warning shall activate for minor variations in analyzer performance. A system alarm shall activate for major variations in analyzer performance and it shall shut down the analyzer until corrective action is taken. The microprocessor also shall provide self-diagnostic functions accessible through an alphanumeric, menu-driven keyboard. Two SPDT normally open/normally closed dry contact relays rated at 5A resistive load at 230 VAC shall be provided.

Recorder outputs shall be a 4-20 mA. Recorder span minimum and maximum values shall be operator programmable at the menu-driven keypad over the entire operating range.

The chlorine analyzer shall be housed in an IP-62 rated, ABS plastic enclosure which is designed for wall mounting. The enclosure shall have two clear polycarbonate windows for viewing the measurement readout and reagent levels. Power requirements shall be 100-115/230 VAC, 50/60 Hz, switch selectable, 90 VA maximum.

Water Quality Guidelines

PAGE LEFT BLANK ON PURPOSE

MIOX ON-DEMAND CHEMISTRY

Water Quality Guidelines

Knowing what to look for when sizing a system will help remove hidden surprises after installation. Most of the items on the following list will be below the limits but should be checked nonetheless. Concentrations or measurements in brine feed water and/or treated water that are less than the stated limits are not anticipated to have the stated effect. These factors can affect the oxidant demand of each individual water system, the oxidant production of the MIOX system, or the life of the cell itself. It is important to use "worst case" measures since water quality can vary from season to season.

PARAMETER	MEASURE	LIMIT	WHAT IS IMPACTED		
			Oxidant Demand	Chlorine Production	Cell Life
Total Hardness **	grains/gal (or mg/L)	<3 grain (<51 mg/L)		•	•
Iron (Fe) **†	mg/L	<1 mg/L **	•		•
Manganese (Mn)	µg/L	<50 µg/L **	•	•	•
Fluoride (Fl)	mg/L	<1 mg/L			•
Silica (SiO_2)	mg/L	<80 mg/L		•	•
Bromide	mg/L	<50 mg/L			•
Cyanide	mg/L	<1 mg/L			•
Lead (Pb)	mg/L	<2 mg/L			•
Dissolved Sulfides (as H_2S)	mg/L	***	•		
Ammonia Nitrogen (NH_3-N)	mg/L	***	•		
Organic Nitrogen (Org-N)	mg/L	***	•		
Total Organic Carbon (TOC)	mg/L	***	•		
pH	-	5-9		•	•
Water Temperature Range ^	°F (or °C)	55-80 °F (12-27°C)		•	•

**Caution: water softeners will remove these components up to a limit. See references to maximum ferrous iron and manganese in water softener documentation. Total hardness affects cell life only in that higher hardness requires acid washing to remove carbonate deposits from the cell. Use of water softened to < 1 grain hardness should not require acid washing of the cell.

*** Oxidant demand is affected by any level of H_2S, ammonia or organic nitrogen, or TOC.

† Iron may deposit $Fe(OH)_3$ on the anode, causing an electrical "blind", which would increase the brine proportion pump signal voltage (brine proportion pump speed) needed for the system to reach the operating window. Chlorine production would remain the same, but salt conversion effi ciency will decrease. The same effect is true of silica on the cathode.

^ The system will operate with water temperatures outside this range; however, there will be a performance change. Follow the system specifications for absolute limits.

Salt Quality Guidelines

PAGE LEFT BLANK ON PURPOSE

MIOX SALT GUIDELINES

Revised June 17, 2014

SALT GUIDELINES FOR MIOX GENERATORS

General Information

MIOX Corporation (MIOX) places importance on the quality of salt used in operating on-site generation equipment. High quality salt minimizes expense and customer equipment maintenance issues while maximizing the quality of the water treated using MIOX equipment. MIOX recommends food grade salt to help optimize MIOX system performance. Because contaminants can vary widely, even within the same mine, it is vital to request the most recent site specific contaminant analysis. The contaminant analysis should document the date that quality control was performed and the physical location where the salt was mined and processed. MIOX recommends that our customers regularly request salt product data sheets from the manufacturer to ensure consistent quality control. A reputable supplier will include the date of the quality analysis on the specification sheet in addition to the salt mine location. Please note, higher quality salt alone will not ensure reduced maintenance. Water used by the MIOX system must be softened adequately as well.

Warranty

MIOX continually strives to review and address all warranty claims in an equitable manner. It is important for our customers to understand that the use of poor quality salt may impact warranty claims. MIOX does not accept liability for any salt selected by the customer for use in MIOX equipment. MIOX reserves the right to deny any claims that could be considered under warranty if the equipment or electrolytic cell is performing below specification or is damaged due to contamination caused by, but not limited to, calcium, magnesium and insoluble material in a salt selected by the customer. NOTE: self-cleaning MIOX systems require the use of salt with a purity of 99.5% NaCl or greater (typically food grade) as described in the “Salt Purity” section below or the warranty is void.

Salt Purity

For all **self-cleaning systems,** only salt with a purity greater than 99.5% may be used (typically food grade) or the warranty is void. For all **non-self-cleaning systems,** MIOX recommends salt with a purity level of 99.5% NaCl or greater. Below is a table depicting what MIOX recommends for **non-self-cleaning systems** and what MIOX requires to keep the warranty intact for **self-cleaning systems.**

Component	Percent Minimum
NaCl (dry)	99.5
Impurity	**Percent Maximum**
Calcium (in all forms)	0.01
Magnesium (in all forms)	0.01
Manganese	0.00002
Iron (as Fe)	0.0005
Insolubles	0.005
Additives	0.0001

For several reasons, salt quality is highly variable and MIOX cannot control the quality processes at salt manufacturing sites. Typically, salts with fewer contaminants are more expensive because of additional purification steps during processing. Salt manufacturers usually provide salt product data sheets that list contaminants of concern in each type of salt they sell. Customers assume that the delivered salt will meet the specifications provided by the manufacturers. However, not all contaminants of concern for a specific application will be listed. For example, bromide in salt used for electrolysis can elevate the concentration of bromate in the treated water. Bromate is a water quality concern in drinking water applications, but not necessarily industrial applications.

There are three primary contaminants commonly listed in a salt product data sheet that impact the electrolytic cell; calcium (Ca), magnesium (Mg) and insoluble material. High calcium and magnesium salt concentrations cause accumulation of calcium/magnesium carbonate and magnesium hydroxide in the electrolytic cell. Fouling by these deposits in the cell is the single largest cause of maintenance issues. Insoluble material or solids present in the salt that do not dissolve in water can also deposit in the cell along with carbonates. This co-deposition tends to reduce the effectiveness of acid to remove the carbonates. As a result, longer acid wash times and sometimes physical scrubbing of the cell plates is required to remove the deposit. Other contaminants, such as manganese (Mn) and iron (Fe), are known to affect cell performance by producing an oxide layer that increases the degradation rate of the plates. MIOX recommends that the manganese and iron concentrations in salt not exceed 20 parts per billion in the electrolyte solution entering the cell. Manganese and iron are not included in MIOX's salt specification maintenance worksheet because they are not often reported on salt product data sheets. However, low concentrations of Mg and Ca are associated with low concentrations of Mn and Fe.

MIOX's Salt Specification Maintenance Worksheet versus Salt Manufacturer's Product Data Sheets

Although MIOX makes recommendations on the ideal salt for use in the on-site generation process, it is the customer's responsibility to obtain a salt quality analysis (salt specification or product data sheet) from the supplier and determine its suitability for their situation, region and application.

The salt manufacturer's product data sheet should contain information regarding the amount of calcium, magnesium and insoluble material in the salt at a minimum. MIOX and its customers use this standard information to estimate the amount of maintenance that is associated with these contaminants. This salt specification maintenance table is shown below.

	Lower Limit	Upper Limit	Maintenance
Calcium (Ca) (%)	0	0.020%	Acid wash for 20 min at 3000 hrs / quarterly
	0.020%	0.05%	Acid wash for 20 min at 750 hrs / monthly
	0.050%	0.08%	Acid wash twice for 20 min each at 24 hrs / daily
	0.080%	---	Calcium too high
Magnesium (Mg) (%)	0	0.020%	Acid wash for 20 min at 3000 hrs / quarterly
	0.020%	0.05%	Acid wash for 20 min at 750 hrs / monthly
	0.05%	0.08%	Acid wash twice for 20 min each at 24 hrs / daily
	0.08%	---	Magnesium too high
Insolubles (%)	0	0.01%	Change brine filter at 750 hrs / monthly
	0.010%	0.05%	Change brine filter at 325 hrs / biweekly
	0.050%	0.1%	Change brine filter at 24 hrs / daily
	0.10%	---	Insolubles too high

Please note that the manufacturer's product data sheets do not always give these contaminant concentrations in a standard form and the listing may refer to a brand of salt sourced from different salt mines. Different salt mines have different quality parameters. Be sure to request the salt product data sheet that is specific to the salt you will use in the MIOX system, including the mine location. For drinking water applications, the amount of bromide that may be present in certain salts should be evaluated because bromide can be converted to bromate in the cell.

Additives

Most salts have four basic types of additives:

- Hardening agent (Sodium Hexametaphosphate or SHMP)
- Cleanser (Citric Acid based)
- Free flowing/anti-caking agent (Yellow Prussiate of Soda or YPS)
- Detergents/surfactants

MIOX does not recommend the use of salt with additives. However, some customers have successfully used salts with these additives. Note that detergents/surfactants in the salt may cause foaming in the oxidant tank and reduce the effectiveness of the hydrogen venting system due to foam. It may be necessary to increase the vent pipe size. Organic additives such as citric acid can also be a source for additional trihalomethanes and haloacetic acids.

Physical Salt Size

Salt that is coarse or extra coarse is preferred. Granular or pelletized salt can be used equally well but requires some extra attention. Pellets that are larger than about ½ inch in size dissolve

slowly and can contribute to poor brine concentration in the brine tank, particularly when the salt level is low in the tank. For this reason, it is important to keep the brine generator filled at all times. Also, pelletized salt is too heavy to be pneumatically blown into large bulk brine generators.

Brine Filtration

Higher purity salt is often table quality, or food grade salt, in granular form. While this salt will work well, it requires an adaptation for both types of brine generators sold by MIOX, including the ton-sized bulk brine generators and the smaller brine generators with up to 1,000 gallons capacity. The large bulk brine generators must be filled with a two-layer washed quartz rock bed to avoid clogging of the brine intake port. The bottom layer should be 7 inches of quartz rock deep, using rock sizes between ¼ and ½ inch. The top layer should be 5 inches of quartz rock deep, using rock sizes between 1/8 and ¼ inch in size.

For smaller brine generators that utilize granular (fine grain) salt, a special in-tank roughing filter assembly must be used. Contact MIOX for details on this filter assembly. External to the brine generator and prior to the MIOX on-site generator cabinet, a 5-micron filter is required. This usually takes the form of a 10-inch standard filter housing with a 5-micron pleated filter cartridge element. A dual filter housing arrangement is also available to facilitate filter change-out while the systems are operational.

NSF Standard 60 Salt

Several state regulatory agencies are now requiring that the source material feeding on-site generators (i.e., salt) must be NSF-60 listed to ensure that no hazardous materials ultimately enter the drinking water supply. NSF-60 ensures that chemicals in contact with drinking water are safe and non-toxic to the drinking water supply. For a list of salt suppliers that offer NSF-60 listed salt, refer to the NSF web site at www.nsf.org. Product and service listings may be found at http://www.nsf.org/business/search_listings/.

INTRODUCTION – GENERAL HYDROGEN SAFETY PRECAUTIONS

Introduction

All electrolytic cells that utilize water as a component of the electrolyte generate hydrogen gas in the cell. MIOX manages the risk associated with this hydrogen by engineering safety barriers into all phases of equipment design. These multiple safety barriers have been proven to significantly reduce hydrogen risk and ensure safety, reliability and cost-effectiveness. This document details the advantages of the engineered safety barriers designed to mitigate hydrogen by system component.

MIOX has an outstanding hydrogen safety record, and has been recognized by Hydrogen Safety, LLC as the leader in hydrogen safety for the On-Site Generator (OSG) market.

General Hydrogen Safety Precautions:

- HYDROGEN GAS IS PRODUCED IN ANY ELECTROLYTIC PROCESS AND SHOULD BE ASSUMED TO BE PRESENT IN THE OXIDANT TANK AND ROOM WHERE THE OXIDANT GENERATOR IS LOCATED.
- NO SMOKING OR IGNITION SOURCES IN VICINITY OF THE OXIDANT TANK.
- REMOVE THE OXIDANT TANK LID AND VENT THE TANK AT LEAST ONE HOUR PRIOR TO TANK MAINTENANCE. ENSURE ADEQUATE FACILITY VENTILATION.
- USE OSHA CONFINED SPACE PROCEDURES WHEN ENTERING ANY OXIDANT TANK.
- VERIFY INTEGRITY OF THE LIQUID BARRIER, DILUTION AIR, OR STANDPIPE SYSTEMS TO THE OUTSIDE OF BUILDING.
- THE DROP TUBE SYSTEM INSIDE THE OXIDANT TANK(S) MUST BE IN PLACE PRIOR TO SYSTEM OPERATION.
- HYDROGEN VENT PIPING SHALL HAVE NO VALVES, DROP LEGS (FOR ACCUMULATION OF LIQUID) OR OTHER BLOCKAGE AND SHALL BE ADEQUATELY SIZED TO AVOID BACKPRESSURE.
- IF THE ON-SITE GENERATOR IS MODIFIED OR EXPANDED, CONSULT MIOX OR TECHNICAL EXPERT TO ENSURE TANK VENT MEETS NEW SYSTEM CAPACITY.
- FOR MULTIPLE OXIDANT TANK SYSTEMS, ENSURE THE LIQUID BARRIER HYDROGEN VENT SYSTEM IS NOT CROSS VENTILATED BETWEEN TANKS .
- FOR THE DILUTION AIR VENTILATION SYSTEM, CROSS VENTILATION, OR SERIES VENTILATION, IS ACCEPTABLE. HOWEVER, DO NOT CROSS CONNECT THE LIQUID BARRIER VENT SYSTEM WITH THE DILUTION AIR SYSTEM. THE VENT SYSTEMS MUST BE VENTED SEPARATELY TO THE OUTSIDE OF THE FACILITY.
- DO NOT ADD CHEMICALS OTHER THAN OXIDANT TO THE OXIDANT TANK.
- ENSURE INSTALLATION AND FACILITY DESIGN IS IN CONFORMANCE WITH STATE AND NATIONAL BUILDING AND SAFETY CODES.

GENERAL HYDROGEN FACTS

Hydrogen has flammability limits which are considerably wider than for most other flammable gasses. The lower explosive limit (LEL) of hydrogen is 4.1% by volume in air. A concentration of hydrogen in air less than 4.1% will not be explosive because it is too "lean" in fuel. Likewise, the upper explosive limit (UEL) of hydrogen is 74.2% by volume in air. Therefore a mixture of air containing greater than 74.2% hydrogen will not be explosive, it is too "rich" in fuel. The energy to ignite hydrogen in air is also very low at .017 mJ.

Hydrogen gas (H_2) is the lightest of the gases with a vapor density of 0.069 (relative to that of air taken to be 1.0), and smallest in molecular size, making hydrogen gas difficult to contain. As such, hydrogen gas will tend to rise rapidly in a normal room atmosphere, seek the highest point in a room or container, and tend to diffuse through most materials of building construction.

For an electrolytic cell, the calculated hydrogen generation rate is 6.96 milliliter per amp-minute for each active anode electrode at standard temperature (0 ^{o}C) and pressure (1 atmosphere pressure).

MIOX CELL DESIGN MITIGATES HYDROGEN RISK

MIOX Corporation's electrolytic cells are designed for minimum cell dead volume. Excess space in the cell provides space for hydrogen gas to accumulate. By keeping the available gas volume to a minimum, the risk of creating an explosive condition is minimized. Figure 1 shows the relative gas volumes available in MIOX cells versus conventional circular cell design configurations.

All MIOX cells are designed for low rupture pressure. The cells are typically operated at 15 psi or less and each cell is leak tested to 25 psi. By keeping the rupture pressure of the cell relatively low, less pressure can develop before a cell breach occurs should a hydrogen incident happen. To ensure a low pressure system, a rupture disk is located on the cell inlet. When cell pressure exceeds 28 psi the rupture disk will fail and the system will fault. This failure provides a release path for built up pressure in the cell, greatly decreasing the severity of an overpressure event in the cell.

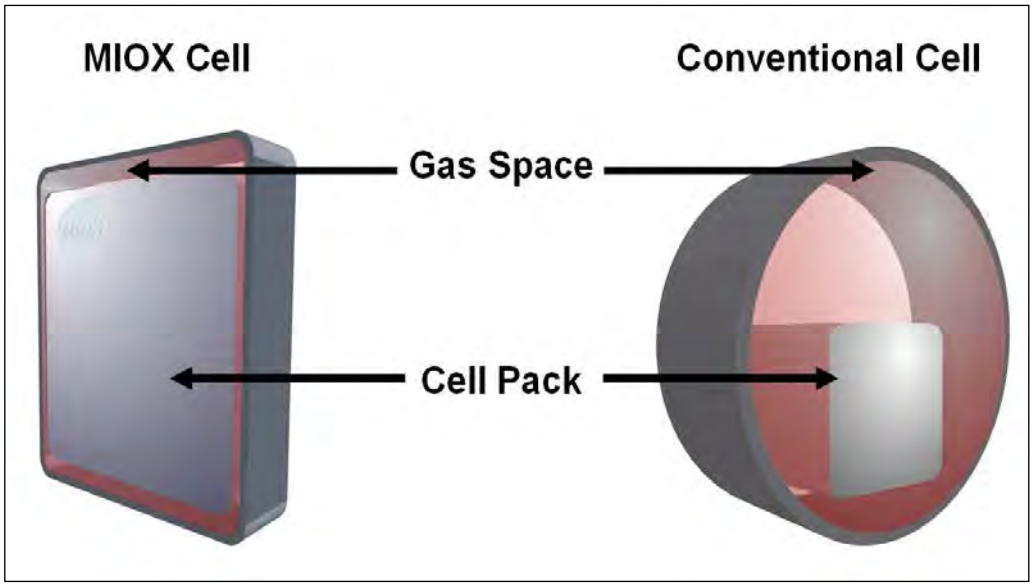

Figure 1. Gas Volume Space in MIOX vs. Conventional Circular Cells.

MIOX OSG ENCLOSURES LOWER HYDROGEN RISK

The RIO Enclosure (Applies to RIO M1-M5 and H1-H5 systems)

To protect operators from a hydrogen or pressure event that may occur within the cell, the larger MIOX systems (whether mixed-oxidant or sodium hypochlorite generators) are housed in an aluminum frame structure combined with rotational-molded, double-walled, linear polyethylene close-out panels that are attached on all sides using ¼-20 stainless-steel fasteners. No latches are employed on the cell compartment access panels. The cell is positioned on a rotational-molded tray that provides downward impact resistance due to the material flexibility. The panels are configured to be hollow with 1/8 inch thick wall sections that are spaced variously (wall to wall spacing) up to 3.00 inches providing flexibility and overpressure expansion allowance to contain any loose components that may be ejected from a ruptured cell. The panels not only provide double wall flexible impact resistance, but the windows in the cell compartment are polycarbonate (Lexan) to provide additional flexibility and safety, and are adhesive bonded to the inner window frame section. The upper cell close-out panel includes a vented window that is attached from the outside with nylon cap-head screws to provide an immediate blow-out path. The removable panels incorporate vent holes within the panels to exhaust gases that may be ejected in a cell detonation event. To verify the integrity of this design concept, the system was rigorously safety tested.

Figure 2 – RIO Enclosure

Stainless Steel Mid and Large Series Enclosures

(Applies to MIOX-25X, MIOX-50X, MIOX-100X, MIOX-250X MIOX-500X, HYPO-50X, HYPO-100X, HYPO-200X, HYPO-500X)

As discussed in the previous section, to protect operators from a hydrogen event that may occur within the cell, the larger MIOX systems (whether mixed-oxidant or sodium hypochlorite generators) are enclosed in stainless steel cabinets (See Figure 3). The front doors of the cabinets are double latched and incorporate internally mounted Lexan® windows that will contain any loose components that may be ejected from a ruptured cell.

The backs of the cabinets have removable panels for rear access. The removable panels incorporate vent holes within the panels to exhaust gases that may be ejected in a cell detonation event. In some systems, the rear panel is a plastic see-through panel held in place with plastic screws. In the case of a cell detonation event, the plastic panel acts as a blast panel to the rear of the cabinet. To verify the integrity of this design concept, the system was rigorously safety tested.

Figure 3 – Stainless Steel Enclosure

LIQUID BARRIER HYDROGEN VENT SYSTEM

The Liquid Barrier Hydrogen Vent (LBS) system (see Figure 3) uses a gas trap system to prevent hydrogen gas produced during the electrolysis process from entering the oxidant storage tank. Each oxidant tank is equipped with a drop tube in the oxidant tank that hydraulically locks the oxidant solution similar to a "P-trap" system in household plumbing. The hydraulic lock creates a liquid barrier preventing hydrogen gas from entering the oxidant storage tank.

The materials of construction for Oxidant Tank Vent and the Liquid Barrier Hydrogen Vent must be CPVC piping as specified by MIOX, and they should be run at least 12" clear of any heat or electrical sources, such as overhead lights or control boxes. No metal piping material may be used for these vents.

The generally accepted limit for hydrogen accumulation is 25% of the LEL, or 1% hydrogen by volume. These limits are easily maintained with the Liquid Barrier Hydrogen Vent System, and have been validated through rigorous testing.

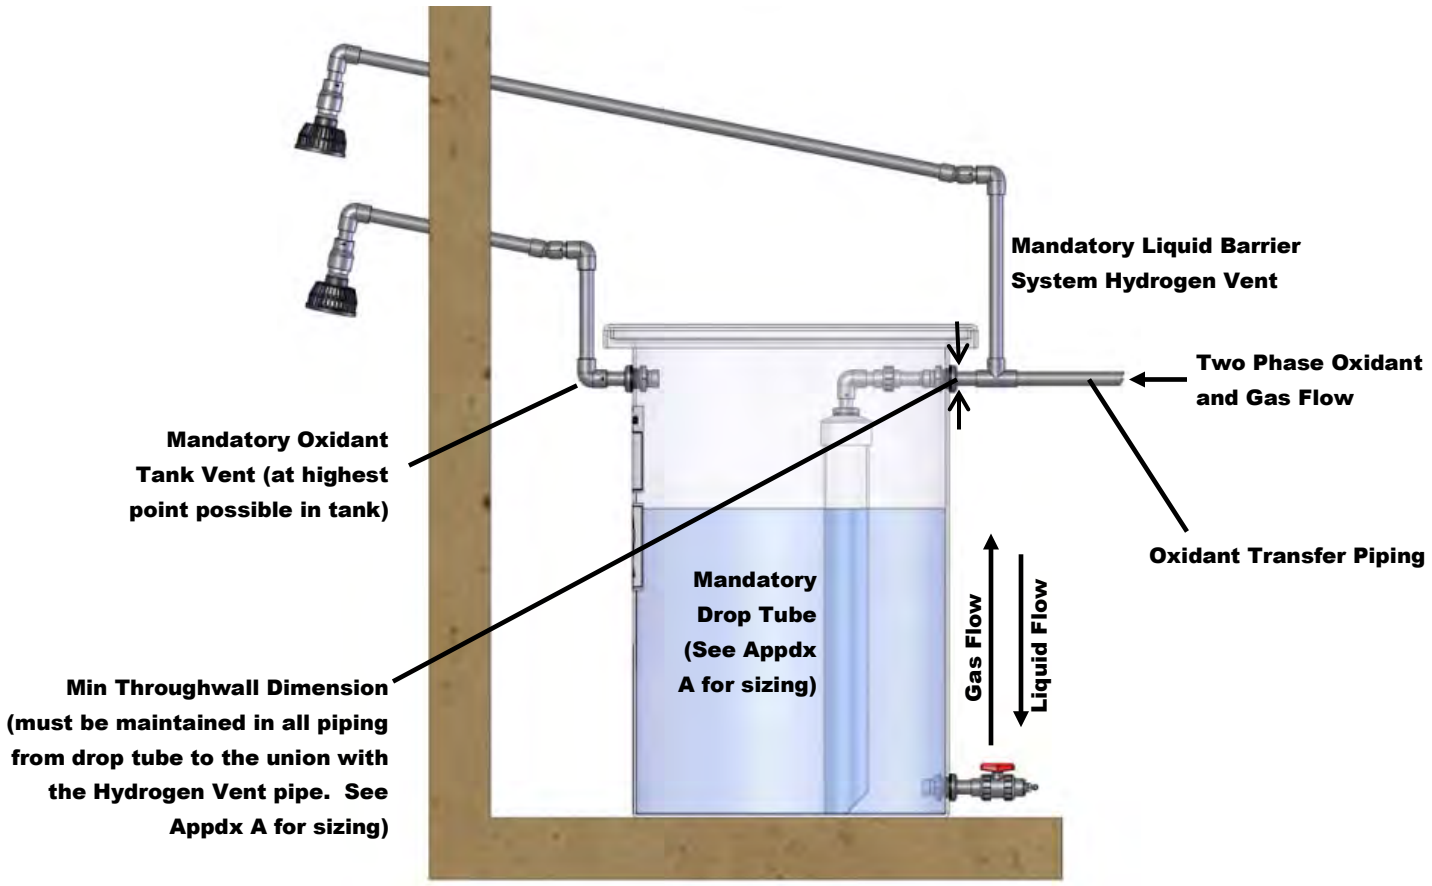

Figure 3. Liquid Barrier Hydrogen Vent System

Drop Tubes

The drop tubes are sized for each system to ensure hydrogen gas separation. The drop

tube diameter must be of adequate volume to ensure that the downward velocity of fluid is slower than the upward flow of bubbles in the liquid stream (See Appendix A for proper sizing). Additional new oxidant generation capacity will increase the volume of fluid entering the drop tube. This may require that the drop tube diameter be increased to ensure effectiveness of the system. The drop tube in the oxidant tank rests on the bottom of the tank. The bottom of the drop tube requires a notch with a 45 degree cut half way to the center of the pipe. The highest point in the drop tube notch must not extend more than 3 to 4 inches above the bottom of the tank to ensure that hydraulic "lock" occurs at a low liquid level in the bottom of the oxidant tank. The drop tube diameter should be maintained within the oxidant tank, through the penetration in the tank and just to the outside of the tank. The oxidant feed line from the on-site generator, as well as the liquid barrier system hydrogen vent lines, need to be plumbed into the larger diameter drop tube piping on the outside of the oxidant tank. This design allows the larger diameter drop tube piping external to the oxidant tank to act as a stagnation chamber for better separation of the liquid oxidant from the hydrogen gas. Most of the hydrogen gas will be trapped and vented through the liquid barrier system hydrogen vent that discharges external to the building.

Oxidant Tank Vent

During initial startup the drop tube system will not be hydraulically "locked" until the bottom of the drop tube is sufficiently covered by liquid. During this period, some residual hydrogen may enter the oxidant tank. Also, a very small amount of hydrogen will be dissolved in the oxidant solution; the amount is a function of the temperature of the oxidant. Over time, this dissolved hydrogen will evolve from the solution into the oxidant tank space. For these reasons, a separate oxidant tank vent connected to the oxidant tank at the highest point in the tank is required. This oxidant tank vent line should be routed separately to the outside of the facility to avoid any possibility of cross ventilation between the drop tube and hydrogen vent systems. On multiple oxidant tank systems, the vent systems from each tank should be routed separately to the outside of the facility. In this manner, a tank that has been drained for service or cleaning will not have a common hydrogen vent header that could possibly allow hydrogen from the active oxidant tank to be transferred through common vent piping to the tank that is drained for service.

In general, the oxidant transfer piping between the on-site generator and the oxidant storage tank must be adequately sized to maintain a reasonably low velocity of the two-phase flow of fluid and gas within the piping to the oxidant storage tank. The piping diameter must be adequately sized for the flow from all of the cell modules tied to the manifold, whether or not all of the cell modules are intended to be operated at the same time (see Appendix A for details). Improperly sized oxidant transfer piping can cause backpressure in the system that can adversely affect the pressure within the cell as well as the proper flow rate in the cell. This can lead to cell damage. Improper oxidant transfer piping size can also cause high velocities within the piping that can entrain liquids into the hydrogen vent piping. The result is that liquid is carried out of the hydrogen vent piping which can cause oxidation damage to facilities and/or vegetation where the liquid drips from the end of the hydrogen vent piping outside the facility. This problem is particularly evident when water softener salt pellets are used in the system bring generator. Water softener salt pellets typically contain surfactants that can cause bubbles in the oxidant piping.

Oxidant Transfer Piping

It is usually desirable to have a sample port in the oxidant transfer piping in order to obtain oxidant samples for analysis. MIOX provides special OPEN-CENTER three-way ball valves with each cell module for this purpose. In addition, special Viton seat diaphragm check valves are supplied with all of the larger cell modules (25 pound per day production and greater) to prevent back flow of oxidant to the cell module when the specific cell module is in standby and other cell modules on the same oxidant manifold are operational.

To avoid shutoff of oxidant from the electrolytic cell during operation, it is important that no two-way valves or dead center three-way valves be installed in any portion of the oxidant transfer piping. This includes air or solenoid operated valves. Inadvertent closure of these valves during cell operation can cause immediate cell damage. Special open-center three way valve configurations can be assembled to allow selective transfer of oxidant from the oxidant manifold to any of several oxidant tanks. Consult MIOX Corporation for details.

Liquid Barrier System Hydrogen Vent

Liquid Barrier Hydrogen Vent piping (See Figure 3) must be properly sized to prevent high velocity liquid flow within the piping (See Appendix A). High velocity flow will prevent gas from separating from liquid in the drop tube, reducing the efficacy of the Liquid Barrier system. High velocities within the vent piping can cause backpressure and can decrease the effectiveness of the overall system. Liquid Barrier Hydrogen Vent piping must not incorporate any restrictions to flow in the pipe or flow restrictions at the discharge of the pipe (See Figure 4 and 5). No valves of any type are permitted in the vent piping. In addition, the hydrogen or dilution air vent piping must be routed to avoid any liquid traps in the plumbing. If the piping includes low points, liquid can accumulate in the low points and act as a hydraulic lock to prevent free flow of gases. Under cold weather conditions oxidant vapor or liquid in the vent pipe could freeze and block flow. In freezing climates, the exit of the vent stack outside the facility should be evaluated to ensure that it is not subject to blockage from cold weather conditions. Vent piping should be routed straight up out of the facility or at a high point through a wall. The hydrogen vent piping should slope back towards the oxidant tank so that liquids can run back to the oxidant tanks.

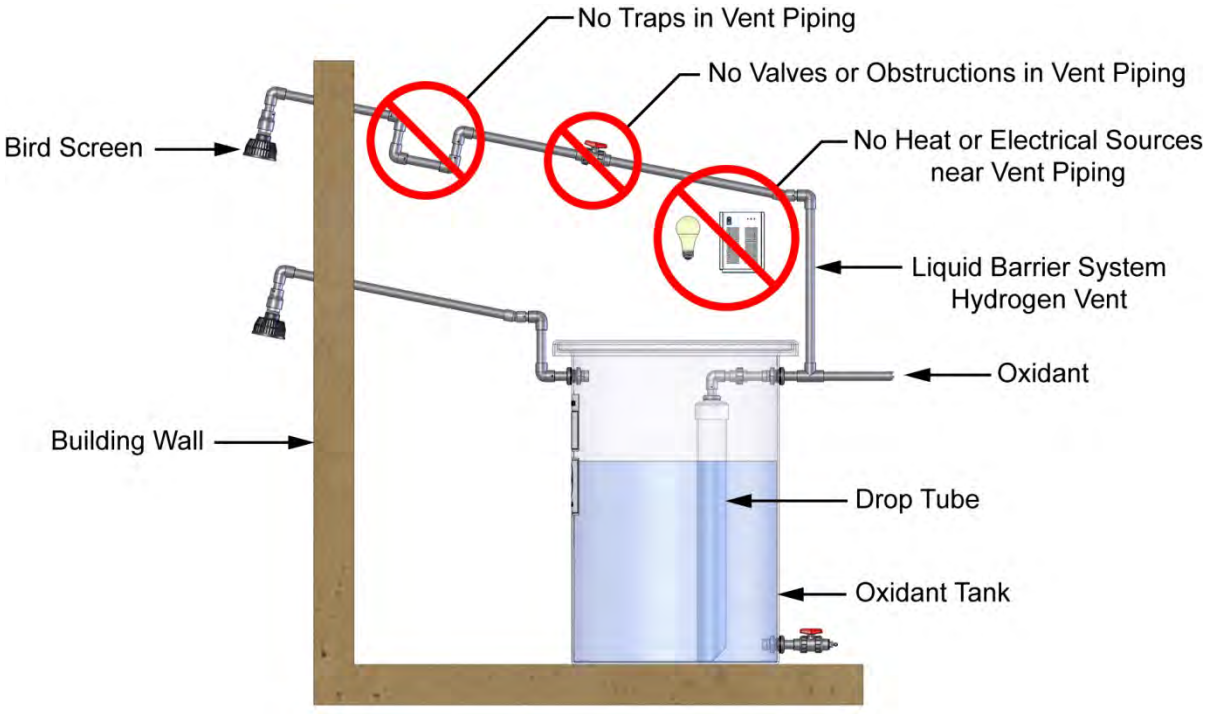

Figure 4 – Liquid Barrier Hydrogen Vent Piping "Don'ts"

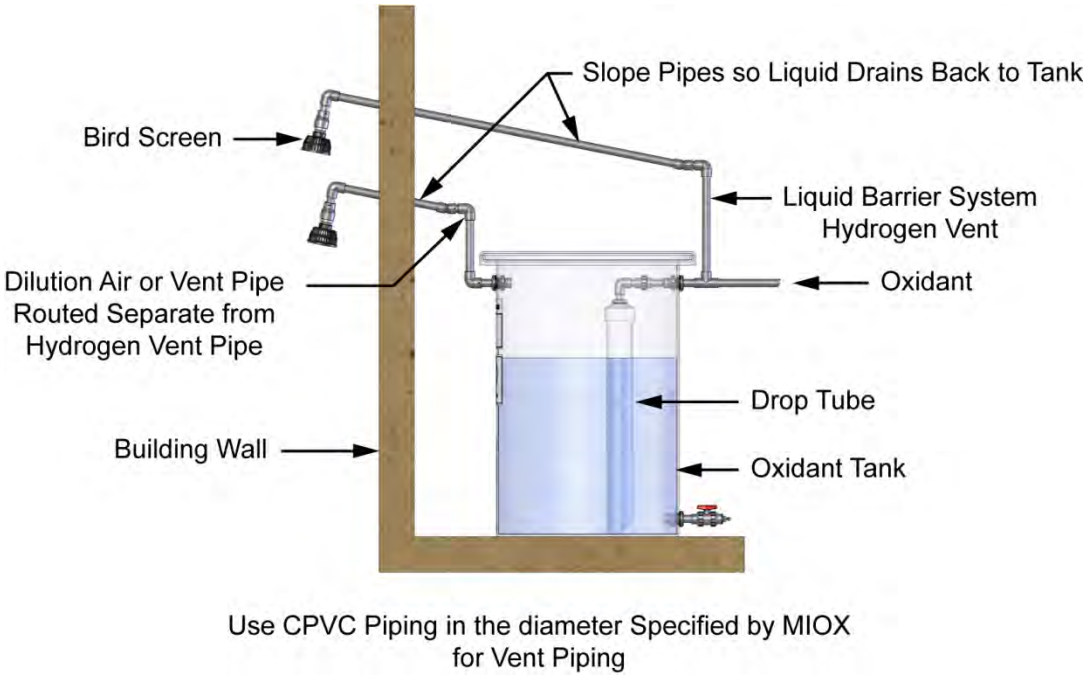

Figure 5. Liquid Barrier Hydrogen Vent Piping "Do's"

DILUTION AIR VENTILATION SYSTEMS

Dilution Air Vent System Principles.
Dual fan-driven Dilution Air Ventilation systems are offered as a supplement to the standard Liquid Barrier Hydrogen vent system. All dilution air systems utilize redundant fans which blow air into the oxidant tank. The flow of the air into and out of the oxidant tank is enough to dilute the hydrogen concentration in the oxidant tank below 25% of the LEL. Thus, the gas in the oxidant tank would not ignite even in the presence of an ignition source. To provide discharge ventilation for the dilution air system, the oxidant tank incorporates a separate vent pipe (separate from the drop tube hydrogen vent pipe) at the top of the oxidant tank that is routed separately to the outside of the building.

By necessity, all dilution air vent systems operate under positive air pressure within the oxidant tank. Due to these conditions, the oxidant tank must be sealed. Many oxidant tanks come with vented covers. These vents must be sealed to prevent dilution air from exiting the oxidant tank. In addition, oxidant tanks may incorporate oxidant overflow ports. These ports may represent a source of dilution air discharge from the oxidant tank. To avoid this situation and still maintain the overflow, the overflow piping can incorporate a drop tube inside the oxidant tank. Internal to the oxidant tank, the overflow port should be plumbed with an elbow fitting and pipe extending down to the bottom of the oxidant tank. The end of the drop pipe should have a 45 degree angle cut in order to allow free flow of liquid in the pipe.

External Dilution Air Ventilation System
The External Dilution Air Ventilation system is configured as a dual fan system with check valves and an air flow switch to provide indication of loss of air flow, and alternate backup fan. The air flow switch is installed in the discharge piping downstream for the oxidant storage tanks just before the piping exits the facility. With the air flow switch located downstream, a leak in the oxidant tank or piping (such as a tank cover being removed) is indicated, and the system will shut down to prevent hydrogen accumulation inside the facility.

The external air vent system utilizes a separate air fan duct and plenum located external to the oxidant tank and low to the ground. The fan is a normal industrial fan that can be configured in most common electrical power arrangements. With the fan low to the ground and external to the duct, the possibility of introducing an electrical arc as an ignition source for hydrogen in the oxidant tank is minimized. The dilution air duct runs up the side of the oxidant tank and enters the oxidant tank near the top edge of the tank or on a “flat” on the top dome of the tank, or in the case of FRP tanks, in to the appropriate flange connection on the top of the tank. Information regarding Dilution Air Sizing can be found in Appendix B.

Dilution Air Ventilation systems are sized for the size of the installation, and therefore are available in a variety of ductwork pipe diameters. The duct size for the dilution air blower system is a function of pressure loss in the ductwork. As backpressure increases, blower output volume decreases. As such, backpressure must be minimized in order to maintain flow volume. An on-line program that can calculate the pressure loss in PVC ducting is located at:

http://www.freecalc.com/gasfram.htm

MIOX Corporation has selected the minimum size duct based on the appropriate flow rate and assumes 100 feet (33m) of duct piping, 6 long sweep ells, and air flow check valves. More complex duct routing systems may need to be evaluated for the specific application. A graphical representation of both the Liquid Barrier Vent System and External Dilution Air vent system is shown in Figure 6.

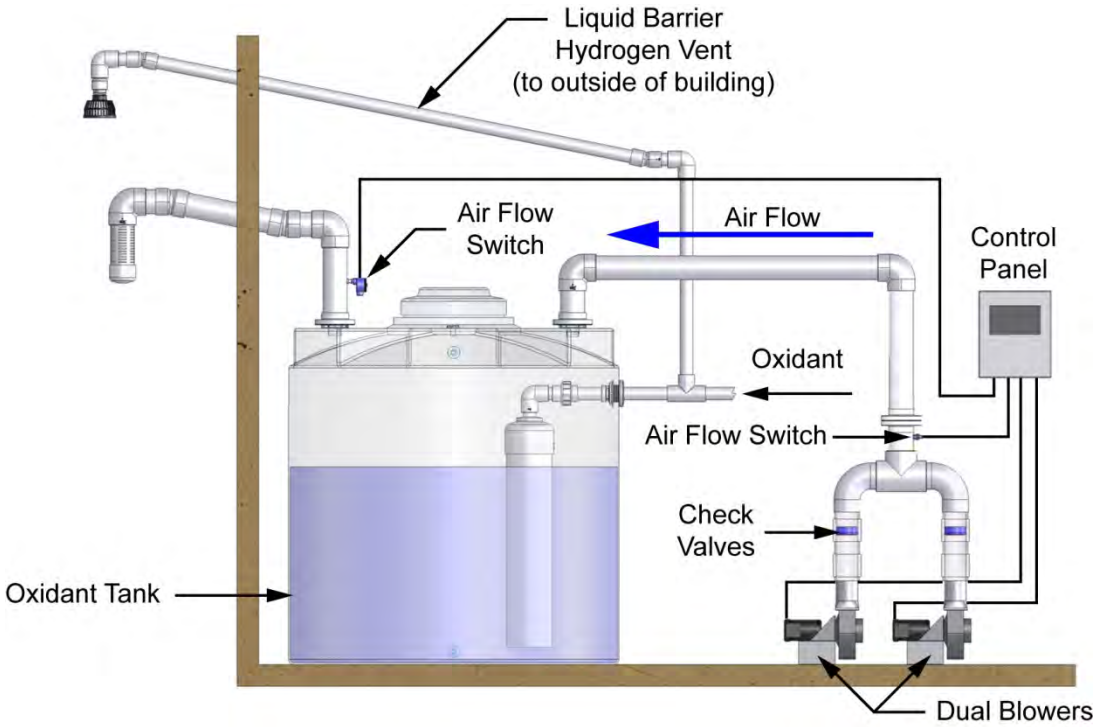

Figure 6. Dilution Air Vent System with Liquid Barrier System

External Dilution Air Vent Controls

The MIOX external dilution air control system consists of a stainless steel control cabinet and a separate blower manifold with dual blowers. The control cabinet is designed to be utilized for all size systems. Slightly different versions of the control cabinet are available for different fan motor voltages. Models available include 110VAC 1phase, 240VAC 3 phase and 480 3 phase. The dilution air system blower and duct sizes are chosen based upon the size and configuration of the particular system.

The control panel incorporates the following functions:

- On first time power up, it performs a test to determine if each blower is operational. Also, during operation the control panel monitors the selected blower. If a blower fails, it is deactivated and the other blower is selected. Failure is detected by the absence of flow from a flow switch installed in the blower manifold.
- Upon detection of a failed blower, a fail light is lit on the front panel of the control panel for the corresponding blower. If both blowers fail both fail indicator lights will flash off and on.
- In addition to the fail indication lights, two relay outputs are provided, one that cycles off and on to indicate a single blower failure or on continuously indicating both blowers failed. This output could be used to drive a two tone buzzer or switch a remote light. The other relay turns on only when both blowers have failed. It could be used to shut down the on-site generator in the event of a double failure or switch a light or alarm. Alternatively these signals could be connected to a SCADA system for remote monitoring. The MIOX RIO system supports direct connectivity to the external Dilution air control system and will automatically suspend operation if a failure is detected. The RIO system provides the run command and three failure inputs, one for the dilution air controller and two optional inputs to support other vent system sensors where required.
- All alarm outputs have dual relay contacts and normally open and normally closed contacts to support different system interface requirements.
- The blower is turned on by applying 24v to the run input.
- The control panel has additional terminal block capacity to support a single point connection to SCADA from other possible hydrogen vent system sensors (i.e. flow switches, etc… as required)
- The system controller has a dip switch with selectable blower shutdown delay from 0 minutes to 45 minutes in 3 minute intervals. This allows the blowers to continue to run after the on-site generator is shut down to assure all hydrogen is purged from the oxidant tanks. The default setting is 15 minutes. The switch is located inside the system controller box.
- The control system randomly selects which blower to turn on each time

the command to run is received, to prevent one blower from wearing faster than the other.

- The system incorporates a manual override for maintenance and service functions. This override allows the user to select a blower. In manual mode the control module is bypassed so alarm outputs are inactive

STANDPIPE HYDROGEN MITIGATION SYSTEM

For larger installations (see Appendix C for specific installation sizes), MIOX requires a Standpipe Hydrogen Mitigation System. A depiction of this system is shown below in Figure 8. In this configuration, a relatively small external standpipe to the oxidant tank is utilized similar to the drop tube in a Liquid Barrier system. Hydrogen gas is separated from oxidant in the standpipe, and then is diluted below its lower explosive limit with a Dilution Air Blower and blown outside the building. Contact MIOX for more details on this system.

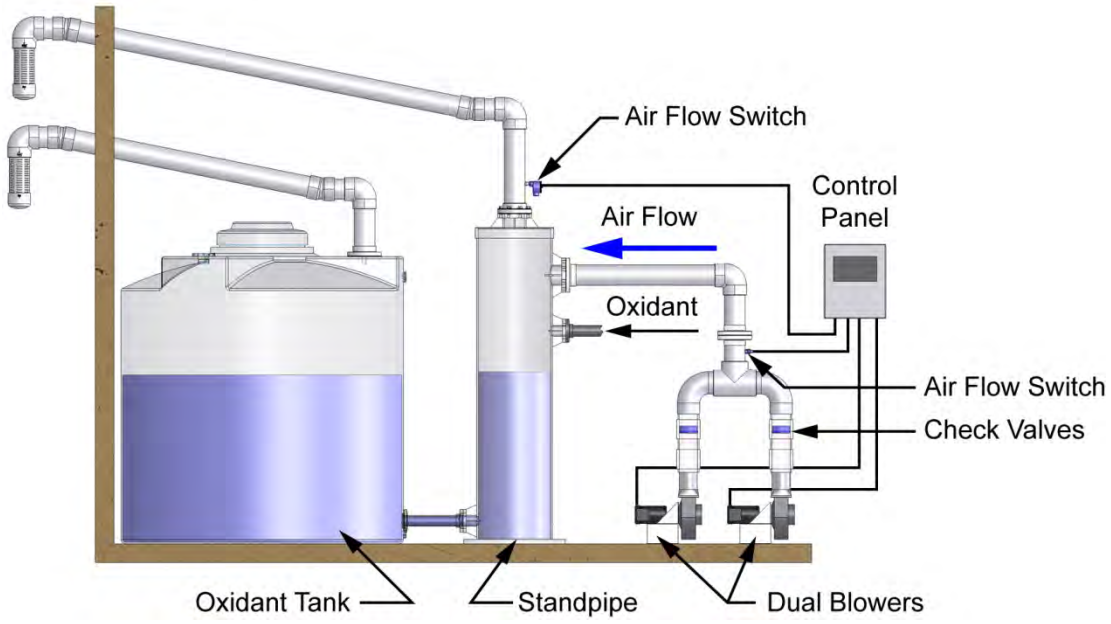

Figure 7. Dilution Air Vent System with Liquid Barrier System

RIO ZUNI SERIES - LIQUID BARRIER HYDROGEN VENT SYSTEM

In 2011, MIOX began to offer for sale the Rio Zuni series of On-Site Generators. On a relative basis, the Rio Zuni series of On-Site Generators generate a small amount of hydrogen. Thus, it is approved to route and connect the Oxidant Tank Vent to the Liquid Barrier System Hydrogen Vent. This is only approved on single Rio Zuni On-Site generator feeding single oxidant tank systems. In the case of multiple oxidant tank and/or multiple on-site generator systems, each tank must be vented independently. In all cases, all other requirements described in earlier in the section "LIQUID BARRIER HYDROGEN VENT SYSTEM" must be met.

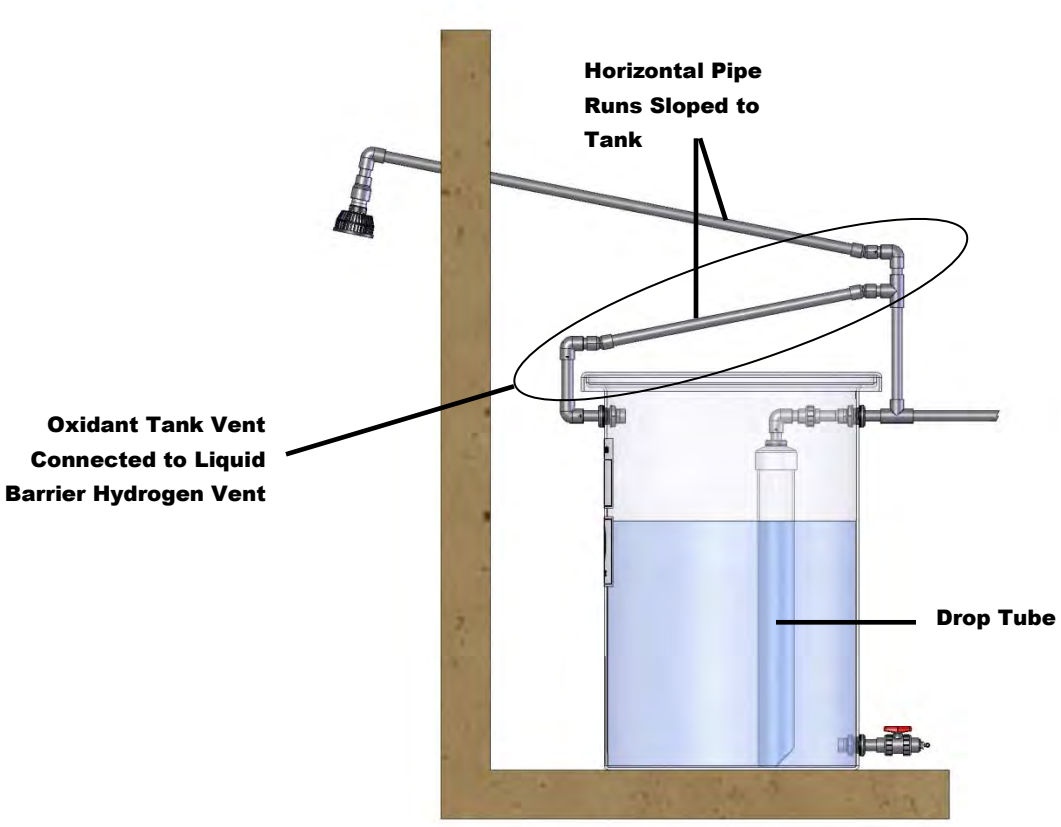

Figure 7. Liquid Barrier Hydrogen Vent System Approved for Single Rio Zuni Single Oxidant Tank Installations.

ADDITIONAL HYDROGEN RISK MITIGATION OPTIONS

HYDROGEN MONITOR

MIOX Corporation offers Mine Safety Appliance (MSA) hydrogen monitors as an optional accessory to detect and alarm the presence of hydrogen within the facility. These systems provide contact closure or 4-20 ma outputs to SCADA or other monitoring systems depending on the desired control configuration. The sensor component of the hydrogen monitor should be mounted high in the facility ceiling in an area where hydrogen gas could be trapped.

LABELING REQUIREMENTS

Safety labels and No Smoking Signs are required ON ALL OXIDANT TANKS as well as ALL HYDROGEN VENTS (Liquid Barrier Hydrogen Vents, Dilution Air Vents, and Oxidant Tank Vents) OPENINGS external to the building. These labels identify safety issues specific to on-site generated solution, as well as no smoking signs. These labels are available from MIOX Corporation, but examples are shown below in figure 9. Oxidant Tanks and Hydrogen Vents must be labeled such that the labels are clearly visible in all directions. More details on this requirement can be found in the installation guide.

CAUTION

- NO SMOKING, OPEN FLAMES, OR ANY OTHER IGNITION SOURCES IN THE VICINITY OF THIS TANK OR VENT
- PERMIT REQUIRED CONFINED SPACE, USE CONFINED SPACE PROCEDURES PER OSHA STANDARD 1910.146
- DO NOT ADD OTHER CHEMICALS TO THE TANK OR VENT
- REFER TO MIOX OPERATOR'S MANUAL FOR OTHER SAFETY RELATED PRECAUTIONS

This Tank or Vent May Contain	Statement of Hazards
• Hydrogen Gas with a Hazard Rating Identification of (0-4-0-Null)	• Flammable Gas present • Fire & Explosion Hazard present • Simple Asphyxiate Gas present
• Dilute (<1% by volume) Sodium Hypochlorite Solution with a Hazard Rating Identification of (1-0-0-Null)	• Moderate Health Hazard present • Incompatible and/or hazardous reactions can occur with addition of other chemicals, such as strong acids, strong reducing agents, amines, ammonium salts, metals, methanol, phenylacetonitrile, formic acid, and ammonia

CODE COMPLIANCE

All on-site generation equipment produces hydrogen gas which is normally contained in the piping and vent systems. Classification of facilities housing on-site generation equipment is determined by the authority having jurisdiction (AHJ). The AHJ may be a state, county, or city agency responsible for safety issues in the community. **MIOX Corporation does not make a determination of the classification for any particular installation**. This is the responsibility of the local authority having jurisdiction. Local engineering firms familiar with the codes and standards in their region are responsible for being sure that local codes are followed in their designs. Selected excerpts from The National Electrical Code, 2008 Edition are included below:

500.5 Classifications of Locations.

(A) Classification of Locations: *Locations shall be classified depending on the properties of the flammable gas, flammable liquid-produced vapor, combustible-liquid produced vapors, combustible dusts ,or fibers/flyings that may be present, and the likelihood that a flammable or combustible concentration or quantity is present…*

(2) Class I, Division 2. *A Class I, Division 2 location is a location*

(1) In which volatile flammable gases, flammable liquid-produced vapors, or combustible liquid-produced vapors are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems or in case of abnormal operation of equipment, or

(2) In which ignitable concentrations of flammable gases, flammable liquid-produced vapors, or combustible liquid-produced vapors are normally prevented by positive mechanical ventilation and which might become hazardous through failure or abnormal operation of the ventilating equipment, or ……..

FPN No. 1: This classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used but that, in the judgment of the authority having jurisdiction, would become hazardous only in case of an accident or of some unusual operating condition. The quantity of flammable material that might escape in case of accident, the adequacy of ventilating equipment, the total area involved, and the record of the industry or business with respect to explosions or fires are all factors that merit consideration in determining the classification and extent of each location.

ADDITIONAL INFO

UPSIZING CAPACITY

Since the Liquid Barrier Hydrogen vent, Dilution Air vent, and Stand-Pipe systems are sized based on the capacity of the on-site generator system, the size of the hydrogen containment systems, liquid barrier or dilution air, need to be re-evaluated if modifications are made to the system, particularly if system capacity is increased either by scaling up the electrolytic cell size or adding additional cell modules to the system.

OXIDANT TANKS

It is mandatory that the engineering parameters defined in this document in terms of hydrogen vent piping be complied with by customers and/or contractors during installation of oxidant storage tanks to ensure personnel safety.

Safety labels are also required on all oxidant tanks and vents (see above section) in addition to the labels normally provided by the tank suppliers. These labels identify safety issues specific to on-site generated solution, as well as no smoking signs. These labels are available from MIOX Corporation.

OXIDANT TANK MAINTENANCE

Periodically, oxidant tanks may need to be cleaned out, or the tank may need maintenance for leaks. Do not use any cleaning or pumping devices that can act as an ignition source to gases that may be in the oxidant tank. When tank entry is required, comply with requirements for Occupational Safety and Health Administration (OSHA) section 1910.146, Permit-required Confined Space. OSHA Section 1910.146, Appendix A has a decision tree for the requirements for entry into confined spaces. Refer to the OSHA web site:
http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=STANDARDS&p_id=9797

SECTION L

MIOX Generated Solution Safety Data Sheet

PAGE LEFT BLANK ON PURPOSE

Safety Data Sheet
MIOX Corporation

SECTION 1- CHEMICAL PRODUCT AND COMPANY INFORMATION

Product Name: On-Site Generated Mixed Oxidant Solution or On-Site Generated Sodium Hypochlorite Solution.
Synonyms: Hypochlorite Solution, Mixed Oxidant Solution
Manufacturer's Name: MIOX Corporation
Address: 5601 Balloon Fiesta Parkway, Albuquerque, New Mexico
Product Information Phone Number: 1-866-MIOX-HLP (1-866-646-9457)
Emergency Contact: 1-866-MIOX-HLP (1-866-646-9457)
Recommended Use: Product is generated as needed with minimal storage. Potable, recreational, and industrial water treatment and disinfection; surface sanitation.

SECTION 2- HAZARDS IDENTIFICATION

Pictogram:
Signal Word: CAUTION.
Hazard Statements:
H303 May be harmful if swallowed.
H316 Causes mild skin irritation.
H320 Causes eye irritation.
H402 Harmful to aquatic life
Precautionary Statements:

P264	Wash skin thoroughly after handling.
P273	Avoid release to the environment.
P280	Wear protective gloves/protective clothing/eye protection/face protection.
P301+P330+P331	If SWALLOWED: Rinse mouth. Do not induce vomiting
P302+P362+P353	If ON SKIN: Take off contaminated clothing and wash before reuse. Rinse skin with water/shower.
P304+P340	If INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing.
P305+P351+P338	If IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
P313	Get medical advice/attention.
P391	Collect spillage.
P501	Dispose of content/container to an approved waste disposal plant.

Other Hazards: Hazards associated with On-Site Generation of chemicals are largely associated with the hydrogen gas that is generated during the electrolytic process. Please consult MIOX for more information on hydrogen safety, as it is outside the scope of this document.

SECTION 3- COMPOSITION INFORMATION

Chemical Name	Common Name	Percent by Weight	CAS Number
Sodium Chloride	Salt	< 3%	7647-14-5
Sodium hypochlorite	Bleach	< 0.9%	7681-52-9
Other oxidants	N/A	Trace	N/A
Water	N/A	Balance	7732-18-5

Trade Secret Statement: The exact percentage of each component has been withheld as this information is considered a trade secret.

SECTION 4- FIRST AID MEASURES

Inhalation: If chlorine vapors are inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, provide oxygen and get medical attention immediately.
Ingestion: If swallowed, do not induce vomiting. Give large quantities of water. Never give anything by mouth to an unconscious person. Get medical attention immediately.
Skin Contact: Immediately remove clothing from affected area and wash skin with flowing water. Clothing should be discarded or washed before reuse. Obtain medical attention if irritation persists. Do not instruct person to neutralize affected skin area.
Eye Contact: Immediately flush eyes with plenty of water for at least 15 minutes, while holding eyes open. Contacts should be removed before or during flushing. Do not instruct person to neutralize. Get medical attention if irritation persists.
Note to Physician: Dilute sodium hypochlorite solutions such as these products are mildly alkaline but potentially corrosive to the digestive tract. For exposure by ingestion, do not use emesis, lavage or acid antidotes. Dilute immediately by giving milk, melted ice cream, beaten egg white, starch paste or antacids such as milk of magnesia, aluminum hydroxide gel, or magnesium trisilicate gel. Avoid sodium bicarbonate because of carbon dioxide release. Sodium thiosulfate solution may prove beneficial by reducing unreacted material.

SECTION 5- FIRE FIGHTING MEASURES

Fire Fighting Procedures: Use self-contained breathing apparatus and full protective equipment. Acid contamination will produce irritating chlorine fumes.
Fire and Explosion Hazards: This product is non-flammable and non-combustible. Vigorous reaction is possible with organic materials or strong reducing agents that may result in fire.
Hazardous Products of Thermal Decomposition and/or Combustion: Oxygen and chlorine are hazardous products of decomposition of sodium hypochlorite.
Special Information: If the solution is accidentally mixed with strong acids, chlorine vapors will be released.
NFPA Ratings: Health- 1 Flammability- 0 Reactivity- 0 Other- None.

SECTION 6- ACCIDENTAL RELEASE MEASURES

Collect liquid in an appropriate container or absorb with an inert material (i.e. dry sand, vermiculite, earth). Ventilate area of leak or spill, and prevent contact with incompatibles. Clean up spills immediately and wear appropriate personal protective equipment as specified in Section 8. Isolate hazard area. Keep unnecessary and unprotected personnel from entering. Contain and recover liquid when possible, and dispose of in compliance with all Federal, Local, and Provincial laws and regulations (Regulations may vary in different locations). Do not allow to enter streams, rivers, lakes, or similar bodies of water. Chlorine content of the product can be neutralized by sprinkling sodium metabisulfite or sodium bisulfite on the spilled material.

SECTION 7- HANDLING AND STORAGE

Handling: Wear appropriate protective equipment. Avoid contact with materials that are incompatible or prone to corrosion. Avoid breathing vapor, mist, or gas. Prevent contact with eyes, on skin, or on clothing. Do not ingest or inhale. Use with adequate ventilation.
Storage: Store in a cool, dry, well-ventilated area away from incompatible substances. Do not store near chemicals that may react if spillage/leakage occurs. Keep container tightly closed.
Other Comments: This substance can decompose on heating or contact with acids or reducing materials, producing corrosive gases including chlorine. This substance is a strong oxidant.

SECTION 8- PERSONAL PROTECTION/EXPOSURE CONTROL

Exposure Limits: No exposure limits have been developed for sodium chloride or sodium hypochlorite.
Personal Respirator: Non required under normal use conditions. Use NIOSH/MSHA approved organic vapor-acid-gas respirator with filter (qualified to wear respirator) during large spill clean-up or other conditions that might produce irritating chlorine-like fumes (e.g. reactions with incompatibles).
Skin Protection: Wear latex, neoprene, or rubber gloves and other protective clothing as appropriate to prevent skin contact.
Eye Protection: Safety glasses with face shield are recommended.
Ventilation Protection: Use local exhaust at points of vapor emission.
Other Protection: Safety showers and eye wash fountains, or other means of washing eyes with a gentle flow of cool to tepid tap water should be readily available in all areas where this material is handled or stored.

SECTION 9- PHYSICAL AND CHEMICAL PROPERTIES

Appearance and Odor: Colorless to light yellow-green liquid with slight chlorine odor.
Vapor Pressure and Density: Not determined.
Boiling Point: Approximately 100^{o}C.
Melting Point: Approximately 0^{o}C.
Specific Gravity: 1.03 at 25^{o}C.
Solubility in Water: Complete.
Volatile Percentage: Not applicable.

pH: 8-10.
Flash Point/Method: Not Applicable.
Evaporation Rate: Not applicable.
Auto Ignition Temperature: Not Applicable.
Decomposition Temperature: Sodium hypochlorite decomposes above 110^{o}C.
Upper/Lower Explosion Limit: Not Applicable.
Viscosity: Not applicable (Approximately that of water).

SECTION 10- STABILITY AND REACTIVITY

Stability: Stable under normal pressures and temperatures. Slowly decomposes on contact with air. Decomposition rate increases with concentration, decreased pH, and elevated temperature. Exposure to sunlight and heavy metals also accelerates decomposition.
Hazardous Decomposition Products: Oxygen and Chlorine gas.
Hazardous Polymerization: None expected.
Incompatibilities: This material is incompatible with strong oxidizing agents, acids, heavy metals, reducing agents, organics, ether, and ammonia. Extended exposure to the product causes corrosion of many metals including stainless steel.
Conditions to Avoid: Avoid using combustible material to absorb large spills. Avoid excessive heat or light exposure and contact with incompatibles. Avoid mixing with acids; lowering the pH of the solution may result in release of chlorine vapors.

SECTION 11- TOXICOLOGICAL INFORMATION

Inhalation- Acute: Inhalation of chlorine vapors causes coughing and choking, burning sensation, labored breathing, shortness of breath, severe respiratory tract irritation, and pulmonary edema.
Inhalation- Chronic: No chronic inhalation effects of this product are known.
Skin Contact- Acute: Skin contact may cause irritation, redness, blisters, and dermatitis.
Skin Contact- Chronic: Repeated or prolonged skin contact may cause skin sensitization.
Eye Contact- Acute: Eye contact causes severe irritation with redness and pain.
Ingestion- Acute: Ingestion may cause pain and inflammation of the mouth, pharynx, esophagus, and stomach; erosion of mucous membranes; vomiting; hemorrhage; circulatory collapse; cold and clammy skin; cyanosis and shallow respiration; confusion; delirium; coma; edema of pharynx; glottis and larynx with stridor and obstruction; and perforation of esophagus and stomach.
Ingestion- Chronic: No chronic ingestions effects of this product are known.
Carcinogenicity/Mutagenicity: Not listed by ACGIH, IARC, NIOSH, NTP, or OSHA.
Reproductive Effects: No reproductive effects for this product are known.
Neurotoxicity: None are known.
Other Effects: None are known.
Target Organs: Skin, eyes, respiratory tract, and digestive system.

SECTION 12- ECOLOGICAL INFORMATION

Ecotoxicity: This product is toxic to aquatic organisms. Do not allow to enter streams, lakes, etc.

SECTION 13- DISPOSAL CONSIDERATIONS

Material that cannot be used or reprocessed for use, and empty containers should be disposed of in accordance with all applicable Federal, State, Local, and Provincial regulations. Product containers should be thoroughly emptied before disposal. NOTE: state and local regulations may be more strict than federal regulations.

SECTION 14- TRANSPORTATION INFORMATION

D.O.T. Shipping Information: See product label and Bill of Lading.

SECTION 15- REGULATORY INFORMATION

CERCLA SECTION 103 (40CFR302.4): yes CAS# 7681-52-9 RQ: 100 lbs.
SARA SECTION 302 (40CFR355.30): No.
TSCA SECTION 304 (40CFR355.40): No.
SARA SECTION 313 (40CFR372.65): No.
OSHA PROCESS SAFTEY (29CFR1910.119): No.
CALIFORNIA PROPOSITION 65: No.
RCRA (40CFR261 Subpart C): If this product becomes a waste, it does not meet the definition of a characteristic waste, and no other EPA hazardous waste codes are applicable.

SECTION 16- OTHER INFORMATION

Disclaimer: MIOX Corporation provides the information contained herein in good faith but makes no representations as to its comprehensiveness or accuracy. This document is intended only as a guide to the appropriate precautionary handling of the material by a properly trained person using this product. Individuals receiving the information must exercise their independent judgment in determining its appropriateness for a particular purpose. It is the buyer's and/or users responsibility to make sure that its activities comply with federal, state, provincial, and local laws. MIOX CORPORATION MAKES NO REPRESENTATIONS OR WARRANTIES, EITHER EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION ANY WARRANTIES OR MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE WITH RESPECT TO THE INFORMATION SET FORTH HEREIN OR THE PRODUCT TO WHICH THE INFORMATION REFERS. ACCORDINGLY, MIOX CORPORATION WILL NOT BE RESPONSIBLE FOR DAMAGES RESULTING FROM USE OF OR RELIANCE UPON THIS INFORMATION.
Issue Date: 22 July 2015
NFPA Ratings: Health- 1 Flammability- 0 Reactivity- 0 Special Notice Key- None.
HMIS Ratings: Health- 1 Flammability- 0 Reactivity- 0 Protective Equipment- B (Protective eyewear, gloves).

DAILY REPORTS

McKeage, Kevin

From: McKeage, Kevin
Sent: Thursday, August 23, 2018 4:55 PM
To: Moayyad, Behnaum CIV USARMY CESPA (US); Amy.E.Cordova@usace.army.mil; Phaneuf, Mark J CIV USARMY CESPA (US); Linda Dreeland; Salazar, Carlos F SPA
Cc: Jercinovic, Devon; Curley, Tyler; Becker, Lee
Subject: Kirtland BFF - Activity Report for Hypochlorite Generator Installation 23AUG18
Attachments: 001 CQM Report 23AUG18.pdf; Photographic_Log_23AUG18.pdf

Issues Today 23AUG18:

None

Resolution of Issues:

NA

Work Performed Today:

- Delivery, inspection, and acceptance of the sodium hypochlorite generator

Installation Completion to Date: 0%

Work Planned for Monday 27AUG18:

- Mark equipment installation locations
- Move hypochlorite generator and supporting equipment into position
- Begin extending water and power utilities to the hypochlorite generator and supporting equipment
- Ultra-pure salt to be delivered

Regards,
Kevin McKeage, E.I.
Engineer

Attachments: 002 CQM Report 27AUG18.pdf; Photographic_Log_27AUG18.pdf

Issues Today 27AUG18:

None

Resolution of Issues:

NA

Work Performed Today:

- Began installation of the sodium hypochlorite generator
- Fastened the hypochlorite generator to the wall of the GWTS
- Delivery and inspection of the water and oxidant piping supplies and electrical conduit

Installation Completion to Date: 5%

Work Planned for Tuesday 28AUG18:

- Begin installation of water and oxidant piping
- Begin installation of electrical conduit

Please let me know if you have any questions.

Issues Friday 28SEP18:

None

Resolution of Issues:

NA

Work Performed Today:

- Installed free chlorine analyzers
- Completed retrofit of existing injection pumps to accept new oxidant supply
- Grouted vent lines
- Final shakedown of the sodium hypochlorite generator

Installation Completion to Date: 100%

Shakedown Completion to Date: 100%

Work Planned for the week of 01OCT18:

- None, installation complete

Remaining Items:

- Final Walkthrough and Acceptance by USACE

Please let me know if you have any questions.

Issues Wednesday 17OCT18:

None

Resolution of Issues:

NA

Work Performed Today:

There were two punch list items identified during the USACE final walkthrough and acceptance on 05OCT18 that were completed today.

- Installed caution tape onto drain lines
- Wrapped up excess communication cable

Installation Completion to Date: 100%

Shakedown Completion to Date: 100%

Work Planned for the week of 22OCT18:

- None, all installation punch list items complete

EA will submit a final letter report to USACE regarding the installation of the sodium hypochlorite generator.

Please let me know if you have any questions.

System Serial #	:	**3318-VM25ABN-0012**
System Part #	:	**000-00172-05**
Cell Serial #	:	**3218-CH25N-0015**
Cell Part #	:	**201-01321-02**

A. FOLLOWUP ACTION ITEMS

a. None

B. SUMMARY

a. A Vault H25 (25#/day) on-site generating system was installed, started and commissioned. This is a non-self-cleaning system.

C. BACKGROUND

a. A startup service trip was scheduled for the week of September 17, 2018

D. ACTION/OBSERVATIONS

a. A sample was taken of the inlet water hardness – results approximately 9 grains per gallon.

b. The outlet of the water softener was sampled for hardness – results 1 grain or less. As a result, a #2 metering disk was installed. The softener cut sheet shows that a #2 metering disk will handle up to 40 grains per gallon.

c. Installed a hose adapter fitting on the sample port of the 3-way valve.

d. The brine tank float was set to operate at the very bottom of the tank. The float assembly was removed and reset so that the float maintains tank liquid level at approximately 50 % full.

e. The regulator for the water supply to the OSG was installed before the water softener. Moved that to just before the OSG (where it belongs) so that the water softener regeneration operation does not affect supply pressure to the OSG. Adjusted inlet pressure to the OSG to 30 psi.

f. The check valve on the OSG solution discharge lines was installed before the 3-way valve. This is not a show-stopper but is normally installed after the 3-way valve.

E. DISCUSSION

a. System was started without any major issues.

F. Data

System Parameters	OSG01
Supply Voltage - phase-to-phase	238 VAC
Supply Voltage – phase-to-ground	119/119 VAC
Control Voltage	24.4 VDC
Operating Parameters	**OSG01**
Cell current – indicated (amps)	80
Cell current – actual (amps)	82.4
Cell voltage – indicated (VDC)	29

Cell voltage – actual (VDC)	29.5
System current draw (amps)	11.8
Cell PS current draw (amps)	11.2
Brine pump control voltage (VDC)	1.09
Water inlet temperature	75
Oxidant outlet temperature	105
Differential temperature	31
Water Pressure – psi (indicated)	31
Water flow - gph (indicated)	21
Cell pressure (psi)	4.5 to tank; 3.5 to sample
System Flow – gph (actual)	20 gph
Solution concentration (ppm)	7550
Production (lbs/day) GPH x PPM x 0.0002	29.91

WARRANTY

MIOX Terms & Conditions of Purchase 08/01/2012

1. ACCEPTANCE: The terms and conditions contained herein constitute the sole terms and conditions governing the purchase by the buyer ("Buyer") stated on the face hereof of the equipment and other items specified on the face hereof ("Equipment"). Buyer shall be deemed to have accepted and agreed to these Terms and Conditions by its receipt of the Equipment or placement of a purchase order. Any terms and conditions different from or in addition to those contained herein, including any contained in Buyer's purchase order or in any other document furnished by Buyer, shall be of no force or effect in connection with the sale of the Equipment and MIOX hereby objects to and rejects in their entirety all such terms and conditions, as MIOX's agreement to sell the Equipment is expressly made conditional upon the use of these Terms and Conditions. No variation to these terms, nor any other terms and conditions by you, shall be of any effect unless such variation or terms are expressly accepted in writing, signed on behalf of MIOX.
2. TRANSPORTATION: For domestic shipments, the terms are F.O.B. MIOX dock, unless the quotation provides otherwise. For international shipments, the terms are EXW MIOX dock, unless the quotation provides otherwise. In either situation, all freight charges and other shipping costs shall be paid by Buyer. MIOX prices do not include freight charges and other shipping costs. Shipping of Equipment returned to MIOX shall be at Buyer's expense.
3. RISK OF LOSS: For domestic shipments, the risk of loss or damage to Equipment in transit shall be upon Buyer, with title to Equipment transferring to Buyer at point when the Equipment is at the disposal of the Buyer. For international shipments, risk of loss and damage shall pass to the Buyer at the point when the Equipment is at the disposal of the Buyer. Title shall pass to the Buyer only when MIOX has received payment in full.
4. RELEASE OF OBLIGATION: No payment, whether final or otherwise, shall operate to release Buyer from any obligations arising as a result of this order. Orders cannot be cancelled by Buyer without MIOX written consent, and then only upon terms that will compensate MIOX for lost profits and all costs and expenses (including any engineering and/or fabrications charges) applicable to the cancelled order.
5. INDEMNITY: Buyer shall defend and indemnify MIOX against all damages, liabilities, claims, losses, and expenses (including, without limitation, reasonable attorney's fees) arising out of or resulting in any way from any act or omission of Buyer, its agents, employees or subcontractors.
6. BUYER'S INSOLVENCY: If Buyer becomes bankrupt or insolvent, or if a petition in bankruptcy or insolvency is filed against Buyer, or if a receiver, trustee, or assignee for the benefit of creditors is appointed for Buyer, MIOX shall have the right, at its sole election, to treat such occurrence as a breach hereof.
7. REMEDIES: In the event of a breach of any one or more of the provisions of this order, MIOX shall have all the rights available to it at law and equity including, but not limited to, (a) to retain any money paid up to an amount which MIOX determines is adequate to cover all damages resulting from Buyer's breach, (b) to assert any claim for damages and any expenses whatsoever, including, without limitation, reasonable attorney's fees, which may be incurred by MIOX by reason of such breach, and (c) to terminate this order immediately upon written notice to Buyer. Such rights shall be in addition to any other remedies provided herein or provided by law or in equity, such remedies to be cumulative and not alternative.
8. PROPRIETARY INFORMATION: Any specifications, drawings, designs, manufacturing data or other information that may be transmitted to Buyer by MIOX in connection with this order are the property of MIOX and are disclosed in confidence upon the condition that they are not to be reproduced or copied or used in furnishing information or equipment to others, or for any purpose detrimental to the interest of MIOX. MIOX shall retain or be entitled to assignment of all intellectual property rights (including copyrights, trademark rights, patent rights, trade secret rights and mask work rights) in any items, features, adaptations, or modifications of Equipment.
9. WAIVER: No waiver by MIOX of any conditions appearing herein shall be deemed to constitute a waiver of any other conditions with regard to subsequent transactions or subsequent parts of the same transaction. No waiver of a breach of any provision of this order shall constitute a waiver of any other breach or of such provisions.
10. FORCE MAJEURE: In the event of a disruption of MIOX business in whole or in part by reason of governmental actions, acts of God, fires, strikes, floods, storms, earthquakes, epidemics, quarantines, wars, insurrections, riots, strikes, acts of civil or military authorities, transportation embargoes, shortages, wrecks, severe weather, labor shortages, computer viruses, other malware, or crashes, Buyer acts or omissions, deliveries of components and materials, or delays by MIOX suppliers, or other causes beyond MIOX's control, MIOX shall have the option of canceling delivered orders in whole or in part. If cancelled by MIOX, any deposits made in conjunction with such order shall be refunded in full to Buyer. Such cancellation shall not constitute a breach of these Terms and Conditions.
11. LICENSE: Subject to the terms and conditions provided in this Agreement, MIOX hereby grants to Customer a nonexclusive, non-sublicenseable, non-transferable license to use all patents, designs, trade secrets, copyrights, or trademarks applying to all Equipment manufactured by MIOX or its contractors either in whole or in part to the Buyer's specifications.
12. TERMS OF PAYMENT: Buyer shall be responsible for payment to MIOX, in full, of the amount invoiced, by pre-payment, or C.O.D., unless credit terms are agreed to in writing and signed by MIOX prior to shipment. If MIOX has granted credit terms to in writing and signed by MIOX prior to shipment.
If MIOX has granted credit terms to the Buyer, all payments must be made on or before the stipulated date unless otherwise agreed to in writing. Failure to pay on or before said date shall constitute a breach of this order,
12 (continued), and MIOX may in addition to all other remedies;
   a. Require Buyer pay interest at a rate of 18% per annum, or at the maximum legal rate if lower.
   b. Suspend any further or other deliveries under any contact with Buyer.

MIOX reserves the right to change terms of payment and discontinue further shipments without prejudice to any other lawful remedy until past due payments are made, or if MIOX, in its sole discretion, deems Buyer to be non-credit worthy. MIOX prices for the Equipment are exclusive of all sales, use, excise and similar taxes and duties and any such taxes and duties shall be the sole responsibility of Buyer.
13. RETURNS: No Equipment will be accepted for return without the prior written approval of MIOX. Buyer shall pay a restocking fee equal to twenty-five percent (25%) of the purchase price for any Equipment accepted for return.
14. INSPECTION AND DEFICIENT PARTS: All inspection or re-inspection performed by Buyer is at Buyer's own expense. Claims for defective material or workmanship, or for missing material, must be submitted to MIOX within fourteen days of receipt of Equipment by Buyer, and must be verified by an authorized agent of MIOX. In such cases, MIOX liability is limited to the replacement or repair of such part or parts as MIOX may decide. Shipping of parts returned as deficient shall be done at Buyer's expense
15. HEADINGS: Headings are inserted for convenience only. In the event any provision of these Terms and Conditions is not enforceable, such unenforceability does not affect the remainder of this order, as the remainder of this order shall remain in full force and effect.
16. APPLICABLE LAW: These Terms and Conditions shall be governed by and shall be construed according to the laws of the State of New Mexico.
17. WARRANTY: MIOX warrants that the MIOX Products when properly installed and operated in accordance with MIOX Products' Operation Manual, will work in accordance with the Technical Specifications and any other specifications defined in the Agreement. This warranty is non-transferrable.
MIOX warrants the MIOX Products against any defects in design, workmanship or material in accordance with the following conditions:
Any defective MIOX Products ("the Defective Product") will be repaired or replaced by MIOX in accordance with the following warranty conditions:
The warranty period varies based on the item and product and is as follows:
   a) All On-Site Generator Enclosures will be warranted for two (2) years starting from the date of shipment from MIOX. Only for the RIO Zuni, the integrated brine tank is considered a part of the enclosure.
   b) All Cells excluding the RIO Zuni Cells will be warranted for five (5) years starting from the date of shipment from MIOX. The RIO Zuni Cell is warrantied for two (2) years starting from the date of shipment from MIOX.
   c) Peripherals and MIOX Products Spare Parts (excluding Cells) will be warranted for one (1) year from the date of shipment from MIOX or by the supplying manufacturer's warranty, whichever is greater.

The warranty shall be void if the MIOX Products, Peripherals or MIOX Products Spare Parts:
   d) have been modified without the express written authorization of MIOX; or
   e) have been damaged, improperly used or subjected to an adverse operating environment, outside of their intended uses and/or environment; or
   f) are repaired or modified by anyone other than MIOX approved personnel; or
   g) have been used in a manner contrary to the MIOX Products Operation Manual or other written instructions provided by MIOX, including but not limited to performing below specification or damaged due to contamination caused by, but not limited to, calcium, manganese, magnesium and insolubles.

THIS WARRANTY IS EXPRESSLY IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OR MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, AND/OR ANY OTHER OBLIGATION OR LIABILITY ON THE PART OF MIOX. The sole and exclusive remedy for breach of any warranty, express or implied, and the only obligation of MIOX thereunder, shall be the repair or replacement of defective products or, at MIOX's sole option, refund of the purchase price or substitution with a new replacement product. MIOX shall in no way be responsible for any consequential damages, of any kind or nature whatsoever, resulting from the breach of any warranty, express or implied.
18. LIMITATION OF LIABILITY. IN NO EVENT SHALL THE LIABILITY OF MIOX HEREUNDER, WHETHER FOR BREACH OF WARRANTY OR CONTRACT, TORT (INCLUDING NEGLIGENCE), PATENT, COPYRIGHT OR OTHER INFRINGEMENT OR OTHERWISE, EXCEED THE PURCHASE PRICE OF THE EQUIPMENT OR PART OR COMPONENT THEREOF WHICH ALLEGEDLY CAUSED THE DAMAGE. IN NO EVENT SHALL MIOX HAVE ANY LIABILITY FOR SPECIAL, INDIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES.
19. NON-ASSIGNMENT. Buyer shall not assign any of its rights or obligations hereunder.
20. ENTIRE AGREEMENT. These Terms and Conditions, the provisions on the face hereof and any other documents incorporated by reference on the face hereof are the sole and exclusive statement of the agreement between the parties concerning the purchase and sale of the Equipment and supersede any prior agreements, orders, quotations, demonstration, samples, proposals or understandings in connection therewith. These Terms and Conditions may only be amended, modified, waived or revoked by a written instrument executed by both parties hereto.

Date Transmitted: **05/11/2018**	Prev. Transmittal Date:		

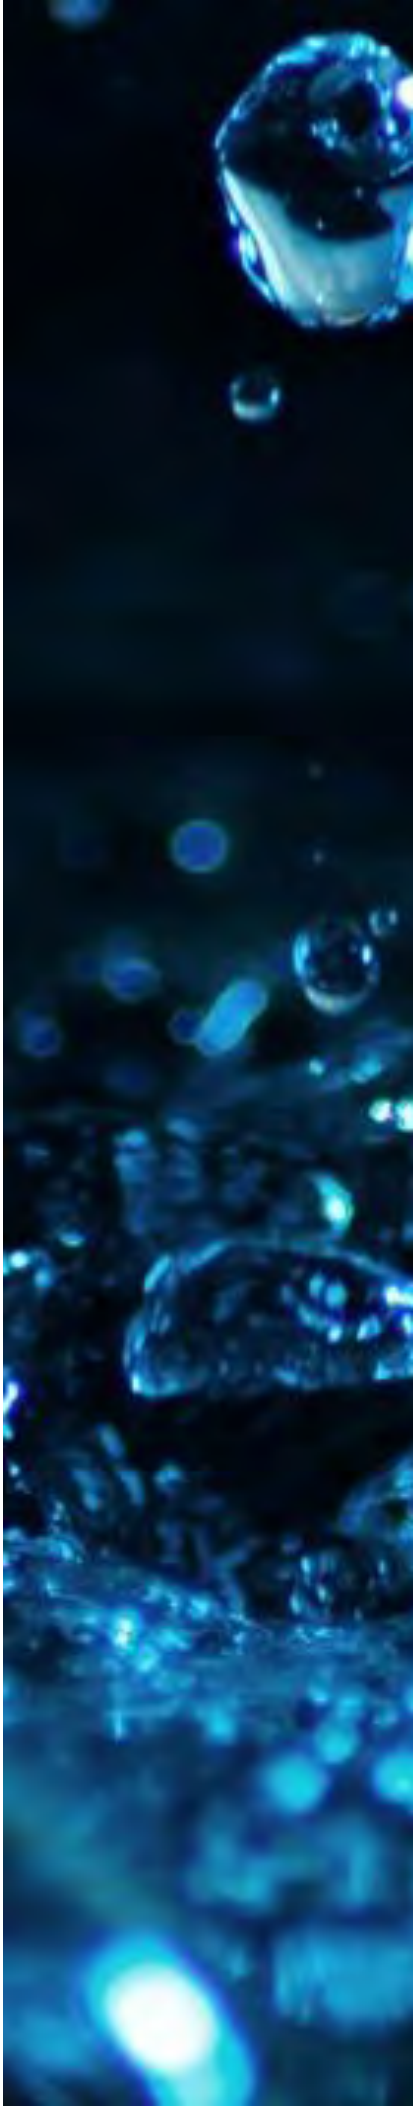
Item No.	No. Copies	Description	Manufacturer	Mfg/Vendor Dwg or Detail	Action Taken*
1	1	Sodium hypochlorite generator and fittings	MIOX and Others	See Attached	**A**

The Action Designated Above is in Accordance with the Following Legend:

A – Furnish as Submitted
B – Furnish as Noted
C – Revise and Re-submit
1. Not enough information for review.
2. No reproducible submitted.
3. Copies illegible.
4. Not enough copies submitted.
5. Wrong sequence number.
6. Wrong resubmittal number.
7. Wrong Spec. Section.
8. Wrong form used.
9. See Comments.

D – Rejected
E – Engineer's Review not Required
1. Submittal not required.
2. Supplemental Information. Submittal retained for Information purposes only.
3. Information reviewed and approved on prior submittal.
4. See Comments.

Review is for general compliance with Contract Documents. No responsibility is assumed for correctness of dimensions or detail. Contractor is required to specify deviations from contract requirements. Lack of exceptions noted by Engineer does not waive Contractor's obligation to comply with Drawings and Specifications.



Comments:
Items reviewed and confirmed to meet requirements
Issues in Bold

Sodium hypochlorite generator exceeds minimum production requirements and fittings are comprised of materials compatible with influent and effluent solutions.

MIOX STANDARD TERMS AND CONDITIONS OF PURCHASE AND WARRANTY INFORMATION

PAGE LEFT BLANK ON PURPOSE

MIOX Terms & Conditions of Purchase 08/01/2012

1. ACCEPTANCE: The terms and conditions contained herein constitute the sole terms and conditions governing the purchase by the buyer ("Buyer") stated on the face hereof of the equipment and other items specified on the face hereof ("Equipment"). Buyer shall be deemed to have accepted and agreed to these Terms and Conditions by its receipt of the Equipment or placement of a purchase order. Any terms and conditions different from or in addition to those contained herein, including any contained in Buyer's purchase order or in any other document furnished by Buyer, shall be of no force or effect in connection with the sale of the Equipment and MIOX hereby objects to and rejects in their entirety all such terms and conditions, as MIOX's agreement to sell the Equipment is expressly made conditional upon the use of these Terms and Conditions. No variation to these terms, nor any other terms and conditions by you, shall be of any effect unless such variation or terms are expressly accepted in writing, signed on behalf of MIOX.

2. TRANSPORTATION: For domestic shipments, the terms are F.O.B. MIOX dock, unless the quotation provides otherwise. For international shipments, the terms are EXW MIOX dock, unless the quotation provides otherwise. In either situation, all freight charges and other shipping costs shall be paid by Buyer. MIOX prices do not include freight charges and other shipping costs. Shipping of Equipment returned to MIOX shall be at Buyer's expense.

3. RISK OF LOSS: For domestic shipments, the risk of loss or damage to Equipment in transit shall be upon Buyer, with title to Equipment transferring to Buyer at point when the Equipment is at the disposal of the Buyer. For international shipments, risk of loss and damage shall pass to the Buyer at the point when the Equipment is at the disposal of the Buyer. Title shall pass to the Buyer only when MIOX has received payment in full.

4. RELEASE OF OBLIGATION: No payment, whether final or otherwise, shall operate to release Buyer from any obligations arising as a result of this order. Orders cannot be cancelled by Buyer without MIOX written consent, and then only upon terms that will compensate MIOX for lost profits and all costs and expenses (including any engineering and/or fabrications charges) applicable to the cancelled order.

5. INDEMNITY: Buyer shall defend and indemnify MIOX against all damages, liabilities, claims, losses, and expenses (including, without limitation, reasonable attorney's fees) arising out of or resulting in any way from any act or omission of Buyer, its agents, employees or subcontractors.

6. BUYER'S INSOLVENCY: If Buyer becomes bankrupt or insolvent, or if a petition in bankruptcy or insolvency is filed against Buyer, or if a receiver, trustee, or assignee for the benefit of creditors is appointed for Buyer, MIOX shall have the right, at its sole election, to treat such occurrence as a breach hereof.

7. REMEDIES: In the event of a breach of any one or more of the provisions of this order, MIOX shall have all the rights available to it at law and equity including, but not limited to, (a) to retain any money paid up to an amount which MIOX determines is adequate to cover all damages resulting from Buyer's breach, (b) to assert any claim for damages and any expenses whatsoever, including, without limitation, reasonable attorney's fees, which may be incurred by MIOX by reason of such breach, and (c) to terminate this order immediately upon written notice to Buyer. Such rights shall be in addition to any other remedies provided herein or provided by law or in equity, such remedies to be cumulative and not alternative.

8. PROPRIETARY INFORMATION: Any specifications, drawings, designs, manufacturing data or other information that may be transmitted to Buyer by MIOX in connection with this order are the property of MIOX and are disclosed in confidence upon the condition that they are not to be reproduced or copied or used in furnishing information or equipment to others, or for any purpose detrimental to the interest of MIOX. MIOX shall retain or be entitled to assignment of all intellectual property rights (including copyrights, trademark rights, patent rights, trade secret rights and mask work rights) in any items, features, adaptations, or modifications of Equipment.

9. WAIVER: No waiver by MIOX of any conditions appearing herein shall be deemed to constitute a waiver of any other conditions with regard to subsequent transactions or subsequent parts of the same transaction. No waiver of a breach of any provision of this order shall constitute a waiver of any other breach or of such provisions.

10. FORCE MAJEURE: In the event of a disruption of MIOX business in whole or in part by reason of governmental actions, acts of God, fires, strikes, floods, storms, earthquakes, epidemics, quarantines, wars, insurrections, riots, strikes, acts of civil or military authorities, transportation embargoes, shortages, wrecks, severe weather, labor shortages, computer viruses, other malware, or crashes, Buyer acts or omissions, deliveries of components and materials, or delays by MIOX suppliers, or other causes beyond MIOX's control, MIOX shall have the option of canceling delivered orders in whole or in part. If cancelled by MIOX, any deposits made in conjunction with such order shall be refunded in full to Buyer. Such cancellation shall not constitute a breach of these Terms and Conditions.

11. LICENSE: Subject to the terms and conditions provided in this Agreement, MIOX hereby grants to Customer a nonexclusive, non-sublicenseable, non-transferable license to use all patents, designs, trade secrets, copyrights, or trademarks applying to all Equipment manufactured by MIOX or its contractors either in whole or in part to the Buyer's specifications.

12. TERMS OF PAYMENT: Buyer shall be responsible for payment to MIOX, in full, of the amount invoiced, by pre-payment, or C.O.D., unless credit terms are agreed to in writing and signed by MIOX prior to shipment. If MIOX has granted credit terms to in writing and signed by MIOX prior to shipment.

If MIOX has granted credit terms to the Buyer, all payments must be made on or before the stipulated date unless otherwise agreed to in writing. Failure to pay on or before said date shall constitute a breach of this order,

12 (continued), and MIOX may in addition to all other remedies;

a. Require Buyer pay interest at a rate of 18% per annum, or at the maximum legal rate if lower.
b. Suspend any further or other deliveries under any contact with Buyer.

MIOX reserves the right to change terms of payment and discontinue further shipments without prejudice to any other lawful remedy until past due payments are made, or if MIOX, in its sole discretion, deems Buyer to be non-credit worthy. MIOX prices for the Equipment are exclusive of all sales, use, excise and similar taxes and duties and any such taxes and duties shall be the sole responsibility of Buyer.

13. RETURNS: No Equipment will be accepted for return without the prior written approval of MIOX. Buyer shall pay a restocking fee equal to twenty-five percent (25%) of the purchase price for any Equipment accepted for return.

14. INSPECTION AND DEFICIENT PARTS: All inspection or re-inspection performed by Buyer is at Buyer's own expense. Claims for defective material or workmanship, or for missing material, must be submitted to MIOX within fourteen days of receipt of Equipment by Buyer, and must be verified by an authorized agent of MIOX. In such cases, MIOX liability is limited to the replacement or repair of such part or parts as MIOX may decide. Shipping of parts returned as deficient shall be done at Buyer's expense

15. HEADINGS: Headings are inserted for convenience only. In the event any provision of these Terms and Conditions is not enforceable, such unenforceability does not affect the remainder of this order, as the remainder of this order shall remain in full force and effect.

16. APPLICABLE LAW: These Terms and Conditions shall be governed by and shall be construed according to the laws of the State of New Mexico.

17. WARRANTY: MIOX warrants that the MIOX Products when properly installed and operated in accordance with MIOX Products' Operation Manual, will work in accordance with the Technical Specifications and any other specifications defined in the Agreement. This warranty is non-transferrable.

MIOX warrants the MIOX Products against any defects in design, workmanship or material in accordance with the following conditions:

Any defective MIOX Products ("the Defective Product") will be repaired or replaced by MIOX in accordance with the following warranty conditions:

The warranty period varies based on the item and product and is as follows:

a) All On-Site Generator Enclosures will be warranted for two (2) years starting from the date of shipment from MIOX. Only for the RIO Zuni, the integrated brine tank is considered a part of the enclosure.
b) All Cells excluding the RIO Zuni Cells will be warranted for five (5) years starting from the date of shipment from MIOX. The RIO Zuni Cell is warrantied for two (2) years starting from the date of shipment from MIOX.
c) Peripherals and MIOX Products Spare Parts (excluding Cells) will be warranted for one (1) year from the date of shipment from MIOX or by the supplying manufacturer's warranty, whichever is greater.

The warranty shall be void if the MIOX Products, Peripherals or MIOX Products Spare Parts:

d) have been modified without the express written authorization of MIOX; or
e) have been damaged, improperly used or subjected to an adverse operating environment, outside of their intended uses and/or environment; or
f) are repaired or modified by anyone other than MIOX approved personnel; or
g) have been used in a manner contrary to the MIOX Products Operation Manual or other written instructions provided by MIOX, including but not limited to performing below specification or damaged due to contamination caused by, but not limited to, calcium, manganese, magnesium and insolubles.

THIS WARRANTY IS EXPRESSLY IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OR MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, AND/OR ANY OTHER OBLIGATION OR LIABILITY ON THE PART OF MIOX. The sole and exclusive remedy for breach of any warranty, express or implied, and the only obligation of MIOX thereunder, shall be the repair or replacement of defective products or, at MIOX's sole option, refund of the purchase price or substitution with a new replacement product. MIOX shall in no way be responsible for any consequential damages, of any kind or nature whatsoever, resulting from the breach of any warranty, express or implied.

18. LIMITATION OF LIABILITY. IN NO EVENT SHALL THE LIABILITY OF MIOX HEREUNDER, WHETHER FOR BREACH OF WARRANTY OR CONTRACT, TORT (INCLUDING NEGLIGENCE), PATENT, COPYRIGHT OR OTHER INFRINGEMENT OR OTHERWISE, EXCEED THE PURCHASE PRICE OF THE EQUIPMENT OR PART OR COMPONENT THEREOF WHICH ALLEGEDLY CAUSED THE DAMAGE. IN NO EVENT SHALL MIOX HAVE ANY LIABILITY FOR SPECIAL, INDIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES.

19. NON-ASSIGNMENT. Buyer shall not assign any of its rights or obligations hereunder.

20. ENTIRE AGREEMENT. These Terms and Conditions, the provisions on the face hereof and any other documents incorporated by reference on the face hereof are the sole and exclusive statement of the agreement between the parties concerning the purchase and sale of the Equipment and supersede any prior agreements, orders, quotations, demonstration, samples, proposals or understandings in connection therewith. These Terms and Conditions may only be amended, modified, waived or revoked by a written instrument executed by both parties hereto.

LEGENDS AND SYMBOLS

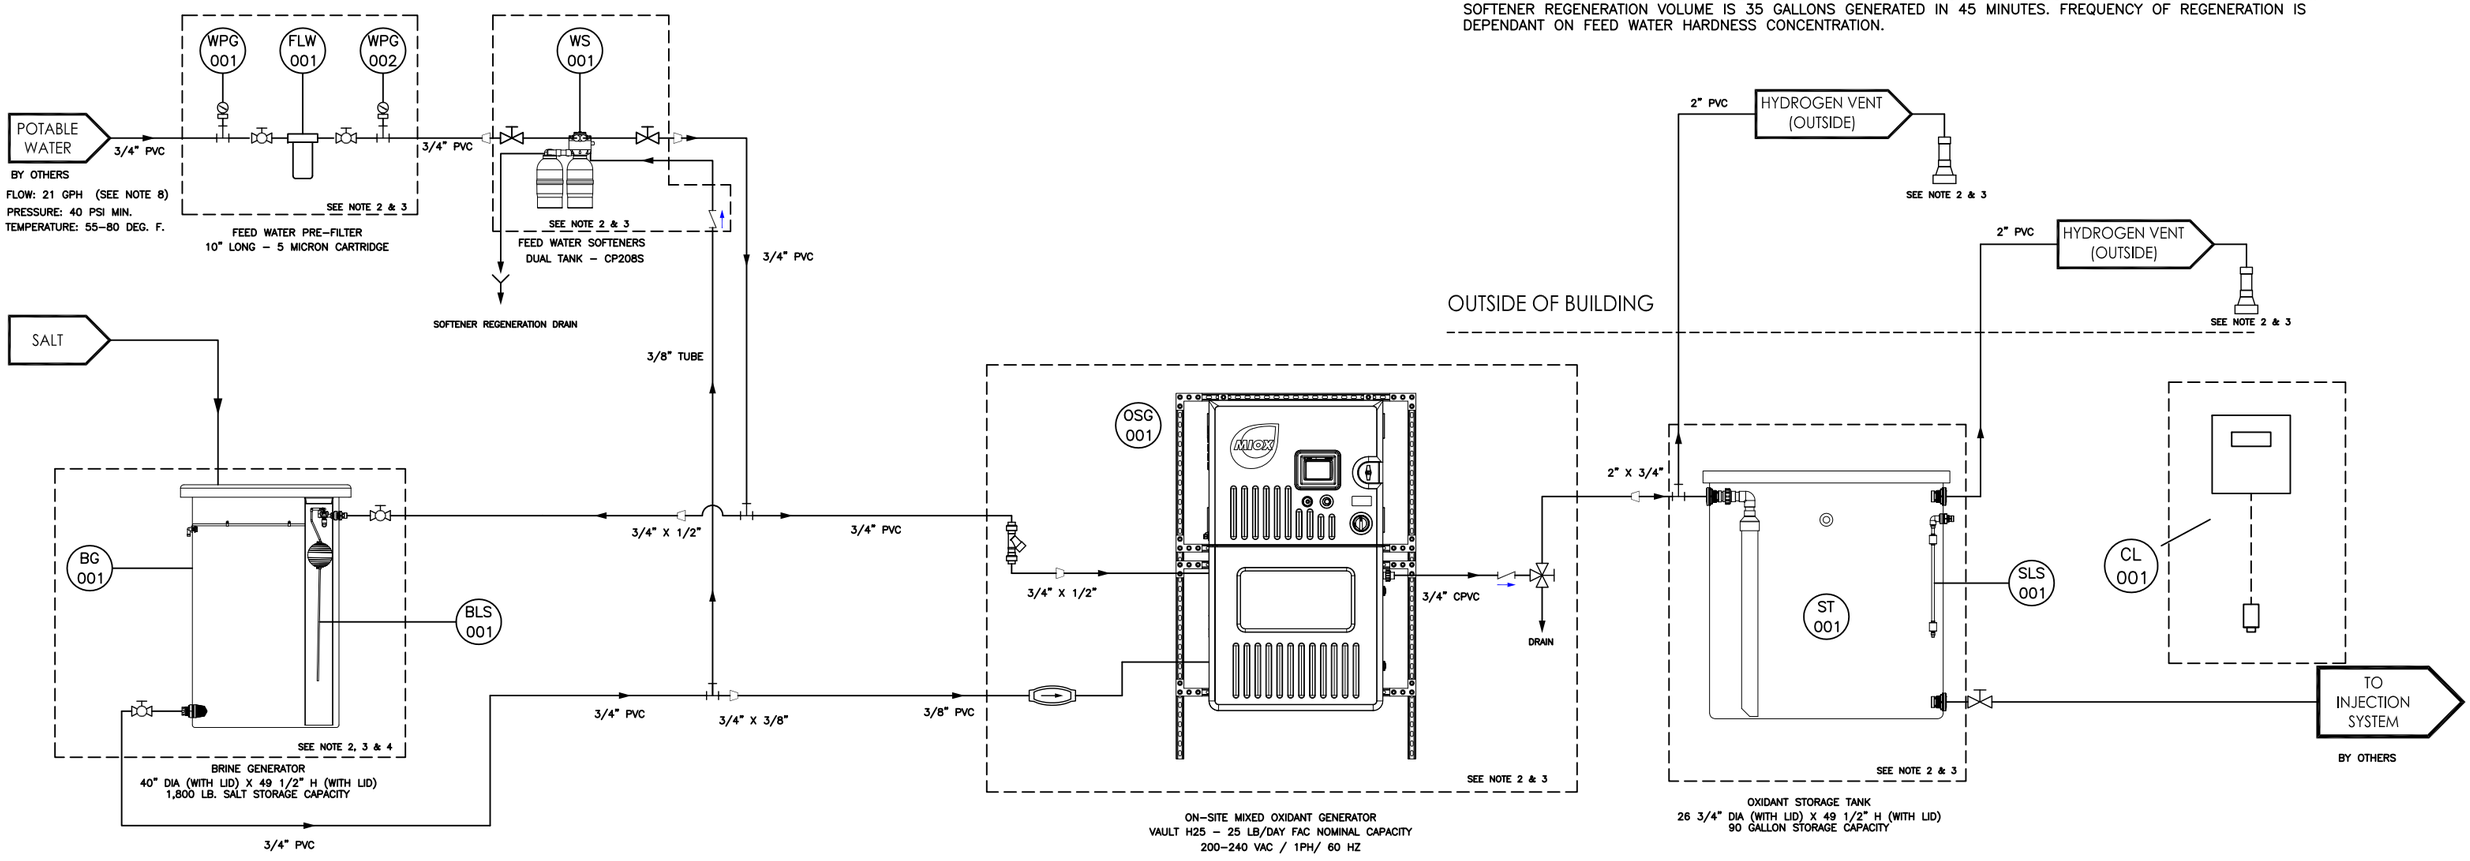
DESIGNED BY:	M. BOTROS	DATE: 05/08/18	SHEET: T-2
APPROVED BY:	M. BOTROS	DATE: 05/08/18	

NOTES:

NOTE 1: THIS DRAWING IS PRELIMINARY PROVIDED FOR INFORMATION PURPOSES ONLY AND SHOULD NOT BE USED FOR CONSTRUCTION.

NOTE 2: EQUIPMENT AND VALVES SHOWN WITHIN THE DASHED BOUNDARY LINES ARE SUPPLIED BY MIOX CORPORATION AND ARE SHIPPED LOOSE FOR INSTALLATION BY CONTRACTOR/OWNER.

NOTE 3: ALL INTERCONNECT PIPING SHOWN WITHIN THE DASHED BOUNDAY LINES TO BE SUPPLIED AND INSTALLED BY CONTRACTOR/OWNER.



NOTE 4: BRINE LOW LEVEL FLOAT SHALL BE SET ABOVE BRINE FILTER INLET TO ENSURE FLOODED SUCTION. NO SECTION OF BRINE LINE SHALL RISE ABOVE FILTER INLET OR A BRINE BOOST PUMP MAY BE REQUIRED.

NOTE 5: ALL EQUIPMENT, VALES, FITTING AND INTERCONNECT PIPING SHOWN ON THIS DRAWING OUTSIDE OF THE DASHED BOUNDARY LINES TO BE SUPPLIED AND INSTALLED BY CONTRACTOR/OWNER.

NOTE 6: SIZES ARE MINIMUM RECOMMENDATIONS. PIPE CONFIGURATIONS ARE SITE DEPENDENT. THIS DRAWING IS INTENDED AS A GUIDE AND MAY NOT ACCOUNT FOR ALL PIPE FITTINGS AND REQUIRED CONNECTIONS.

NOTE 7: RECOMMENDED PIPE MATERIAL OF CONSTRUCTION IS SCHEDULE 80 PVC UNLESS OTHERWISE SPECIFIED.

NOTE 8: FEED WATER FLOW RATE DOES NOT ACCOUNT FOR WATER SOFTENER REGENERATION WATER. SOFTENER REGENERATION VOLUME IS 35 GALLONS GENERATED IN 45 MINUTES. FREQUENCY OF REGENERATION IS DEPENDANT ON FEED WATER HARDNESS CONCENTRATION.

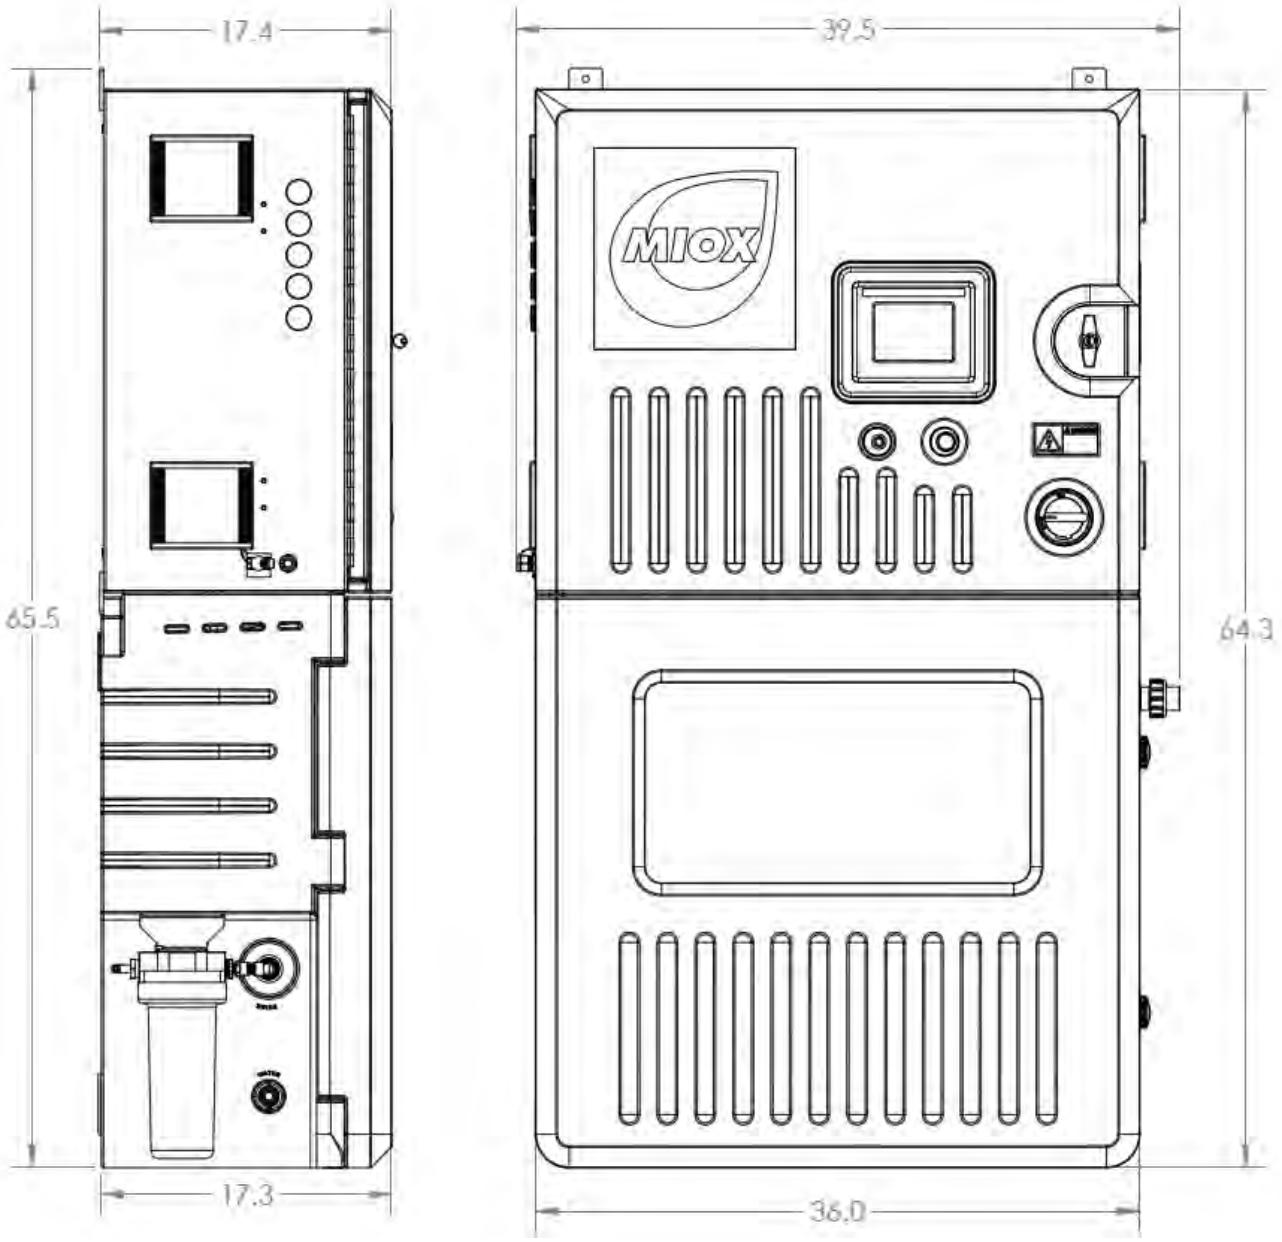
Vault™ Standard HYPO Specifications



The MIOX Vault™ on-site generator is designed for high efficiency, low lifecycle cost, durability and reliability. The Vault standard hypo configuration features self-adjusting flow control and an easy-to-upgrade cell to convert between sodium hypochlorite and advanced mixed oxidant. Expandable capacity offers ultimate flexibility. With over 40% improved salt and energy efficiencies, the Vault is built for cost-effective operation. Using just salt and power to generate a dilute chlorine-based solution eliminates the storage and handling of hazardous disinfection chemicals while providing chlorine residual.

	H Vault 25	H Vault 50	H Vault 75	H Vault 100
Rated FAC Capacity	25 lbs/day 11.3 kg/day	50 lbs/day 22.7 kg/day	75 lbs/day 34 kg/day	100 lbs/day 45.4 kg/day

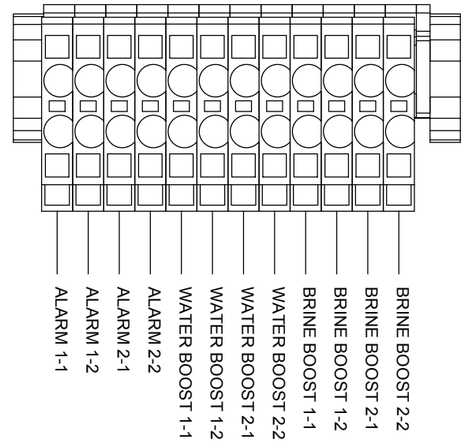
AUXILIARY POWER CONN



THE AUXILIARY POWER CONNECTOR PROVIDES FIELD CONNECTION POINTS TO SUPPLY POWER FOR A HYDROGEN DETECTOR OR TO PROVIDE 24V POWER TO AUXILARY RELAYS. CURRENT IS LIMITED TO 1 AMP AND IS FUSED INTERNALLY.

CONNECTION NAME	CONNECTION DESCRIPTION
+24V DC	24 VOLTS DC POWER
24V RETURN	RETURN CONNECTION FOR 24VDC POWER
PE	PHYSICAL EARTH CONNECTION

AUXILIARY RELAY CONN

THE AUXILIARY RELAY CONNECTOR PROVIDES FIELD CONNECTION POINTS FOR THE AUXILIARY RELAY CONTACTS. THERE ARE THREE AUXILIARY RELAYS: ALARM, WATER BOOST AND BRINE BOOST. EACH RELAY HAS TWO SETS OF NORMALLY OPEN CONTACTS. THE RELAY CONTACTS ARE RATED FOR 277V AC @ 15 AMPS OR 28 V DC @15 AMPS.

CONNECTION NAME	CONNECTION DESCRIPTION
ALARM	CONTACT CLOSE WHEN SYSTEM SHUTS DOWN FOR A HARD FAULT
WATER BOOST	CONTACTS CLOSE WHEN SYSTEM STARS UP (RUNNING)
BRINE BOOST	CONTACTS CLOSE WHEN SYSTEM STARTS UP (RUNNING)

PROPRIETARY AND CONFIDENTIAL
THIS DRAWING AND DESIGN IS THE PROPERTY OF MIOX CORPORATION. IT MAY NOT BE USED FOR ANY PURPOSE OTHER THAN BY THE OWNER. MIOX CORPORATION DOES NOT AUTHORIZE THE REPRODUCTION OR CONVEYANCE OF ANY INFORMATION CONTAINED HEREIN.

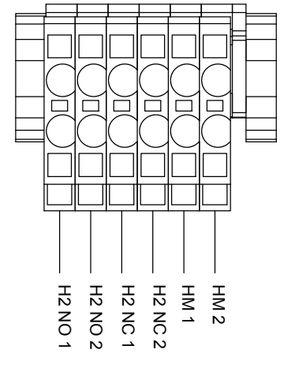
DILUTION AIR CONN



THE AUXILIARY RELAY CONNECTOR PROVIDES FIELD CONNECTION POINTS FOR AN AUXILIARY DILUTION AIR SYSTEM AND/OR ASSOCIATED EXTERNAL DILUTION AIR SYSTEM SENSORS. THE CONNECTIONS SUPPORTED ARE MIOX EXTERNAL DILUTION AIR SYSTEM ENABLE AND MIOX EXTERNAL DILUTION AIR SYSTEM FAILURE INPUT. TWO OTHER FAILURE INPUTS CAN BE CONNECTED TO EXTERNAL DIFFERENTIAL PRESSURE SWITCHES OR AN EXTERNAL FLOW SWITCH.

CONNECTION NAME	CONNECTION DESCRIPTION
DAE +24V DC	24V DC, ENABLE FOR MIOX EXTERNAL DA SYSTEM, TURNS ON AT START UP
DAE RETURN	RETURN FOR ENABLE
DAS FAIL 1-1	FAILURE INPUT (24V DC OK -OVER DC FAIL)
DAS FAIL 1-2	POS +24V DC (SOURCE OF FAILURE INPUT 1)
DAS FAIL 2-1	FAILURE INPUT (24V DC OK -OVER DC FAIL)
DAS FAIL 2-2	POS +24V DC (SOURCE OF FAILURE INPUT 2)
DAS FAIL 3-1	FAILURE INPUT (24V DC OK -OVER DC FAIL)
DAS FAIL 3-2	POS +24V DC (SOURCE OF FAILURE INPUT 3)

H2 / HARDNESS CONN

THE H2 / HARDNESS CONNECTOR PROVIDES FIELD CONNECTION POINTS FOR AN EXTERNAL HARDNESS MONITOR AND/OR AN EXTERNAL HYDROGEN MONITOR. THE HYDROGEN MONITOR INPUTS REQUIRE BOTH NORMALLY CLOSED AND NORMALLY OPEN CONTACTS. THE HARDNESS MONITOR INPUT ONLY REQUIRES NORMALLY CLOSED DRY CONTRCTS.

CONNECTION NAME	CONNECTION DESCRIPTION
H2 NO 1	NORMALLY OPEN INPUTS
H2 NO 2	NORMALLY OPEN INPUTS
H2 NC 1	NORMALLY CLOSED INPUTS
H2 NC 2	NORMALLY CLOSED INPUTS
HM 1	HARDNESS MONITOR INPUT
HM 2	+24V DC SOURCE OF HRDS MON INPUT

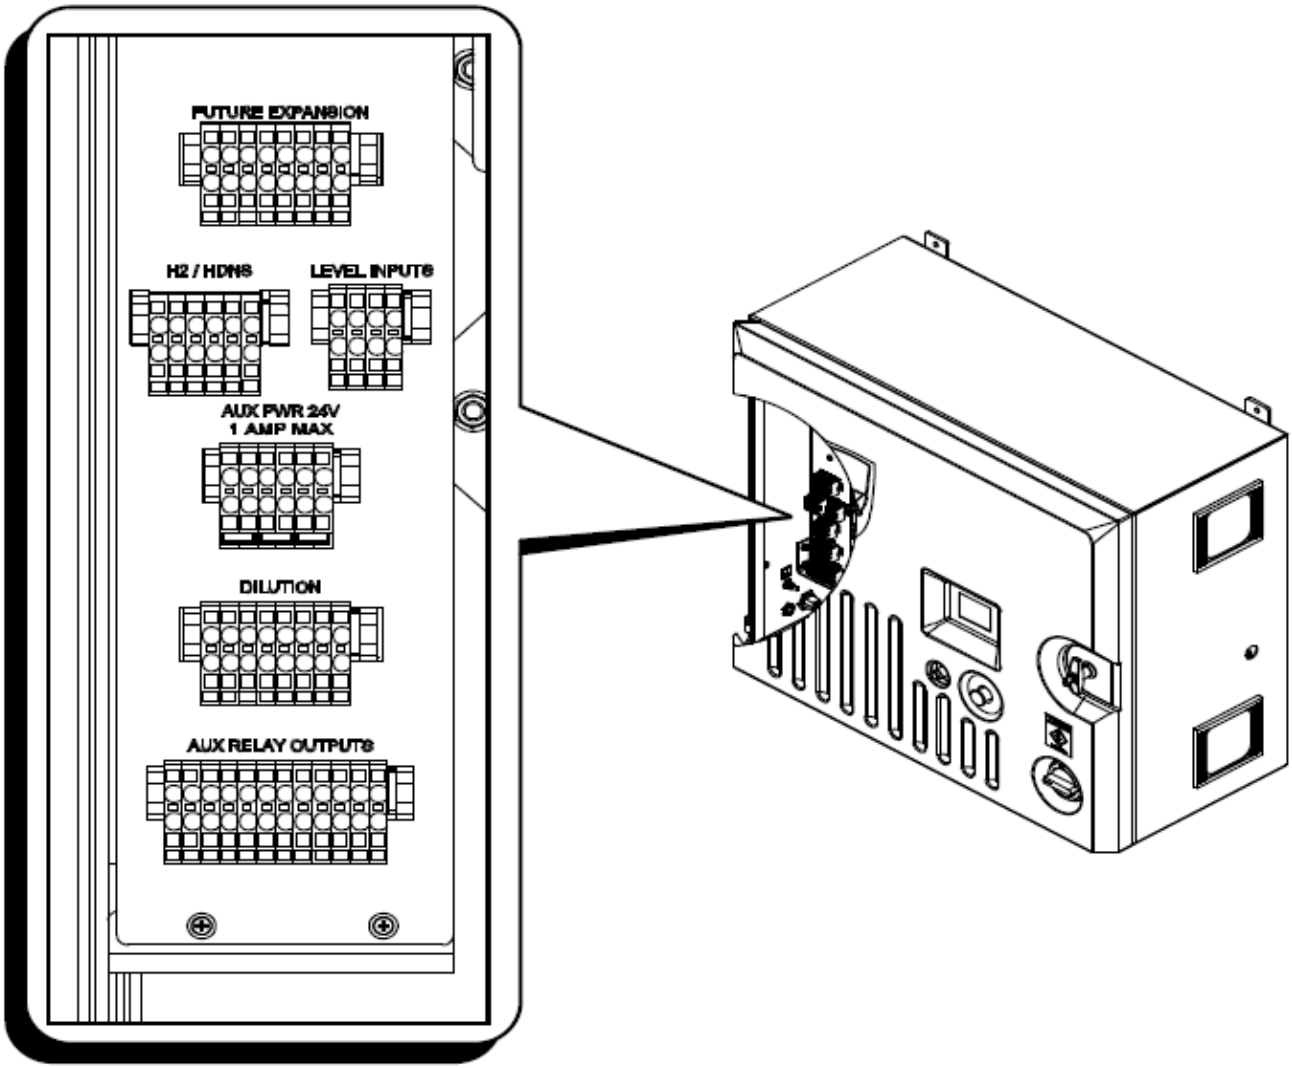
PAGE LEFT BLANK ON PURPOSE

VAULT Controls



The VAULT Series on-site generator cabinet houses the Process Controller, Operator Interface, Ethernet Interface, and I/O Interface Module.

The VAULT Series PLC is an Allen Bradley MicroLogix 1400 Programmable Logic Controller with a 4-Channel Analog Input card included. The control enclosure is located in the upper cabinet behind the color touch-screen interface. The power supply for this equipment is also located in the upper cabinet and all is accessible by opening the hinged enclosure door.

If multiple OSG's are to be used in a single installation, various operating configurations are possible. Individual OSG's can be selected for alternating operation by using the touch-screen interface.

Main Display Screen (Example for documentation purposes only)

Rear Panel Connections

MicroLogix 1400

Small Programmable Logic Controller

Allen-Bradley

Features and Benefits

- Expand your application capabilities with up to 7 expansion I/O modules for a maximum of 256 discrete I/O
- Up to 6 embedded 100 kHz highspeed counters (on controllers with dc inputs)
- 2 Serial ports with DF1/ DH485/ Modbus RTU/DNP3/ASCII protocol support
- Ethernet port provides you with EtherNet/IP, DNP3 over IP and Modbus TCP/IP protocol support as well as web server and email capabilities
- Built-in LCD with backlight allows you to view controller and I/O status, and provides a simple interface for messages, bit / integer monitoring and manipulation

Product Description

The Allen-Bradley® MicroLogix™ 1400 from Rockwell Automation complements the existing MicroLogix family of small programmable logic controllers. MicroLogix 1400 combines the features you demand from MicroLogix 1100, such as EtherNet/IP, online editing, and a built-in LCD, plus provides you with enhanced features, such as: higher I/O count, faster High Speed Counter/PTO and enhanced network capabilities

Take advantage of the built-in LCD with back lighting to set the Ethernet network configuration, display floating point values on a user configurable display, display OEM logos at startup and read or write any binary, integer and long file elements in the data table.

Three embedded communication ports provide you with excellent communications capabilities. MicroLogix 1400 offers an isolated RS232C/ RS485 combination port; a non-isolated RS232C port; and an RJ-45 port for 10/100 Mbps EtherNet/IP peer-to-peer messaging, DNP3 over IP and Modbus TCP/IP protocol.

Similar to the rest of the MicroLogix family, MicroLogix 1400 is programmed with RSLogix 500 programming software (Version 8.1 and above) as well as RSLogix Micro programming software.

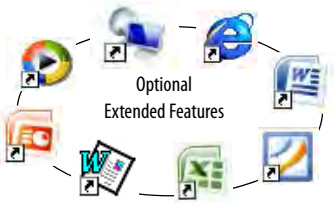
PanelView Plus 6 - 400 and 600 Terminals

The next generation PanelView Plus 6 - 400 and 600 terminals combine the display, logic, communication, and power into one base unit:



- The 400 model has a 3.5-in. color graphic display with keypad or combination key and touch input, or a grayscale display with keypad input.
- The 600 model has a 5.7-in. color or grayscale graphic display with keypad, touch screen, or combination keypad/touch-screen input.

For a complete listing of catalog number selections, refer to the Visualization Solutions Selection Guide, publication VIEW-SG001.

This new generation of terminals runs Windows CE 6.0 operating system similar to the 700...1500 terminals. The terminals run HMI applications but they also provide the ability to access the desktop. For users with more complex application requirements, the 600 color terminals can be ordered with optional, extended features and file viewers.

Table 6 - Terminal Features

Features	Description
High memory capacity	256 MB RAM, 512 MB nonvolatile memory (approx. 73 MB free user memory)
Power input	AC or DC
Communication ports	Units are available with one of these communication options: • RS-232 • Ethernet and RS-232 Separate communication modules are not supported.
USB ports	• 1 USB host ports for connecting a USB mouse, keyboard, printer, and USB flash drives that are hot swappable • 1 USB device port for connecting a host personal computer
Secure Digital (SD) card slot	Hot-swappable card slot supports 1784-SD*x* SD cards for transferring files, upgrading firmware, or logging data
Operating system 	All terminals run the Windows CE 6.0 operating system (OS) providing OS functionality that is needed for most users needs: • FTP server • VNC client/server • PDF reader • Active X controls • Third-party device support Additional functionality is available for the 600 terminals by ordering terminals with these optional, extended features: • Internet Explorer web browser • Media player • Microsoft file viewers for PowerPoint, Excel, and Word • WordPad text editor
FactoryTalk View software	• FactoryTalk View Machine Edition runtime, version 6.10 or later, is preloaded and activated on each terminal • HMI applications are developed with FactoryTalk View Studio for Machine Edition software, which is purchased separately
Reset and default switches	Provide easy access to diagnostic and repair operations

Technical Specifications

Table 7 provides technical specifications for PanelView Plus 6 - 400 and 600 terminals.

The SAFEST WATER In The World

VAULT System Status Parameters

All VAULT systems provide an Ethernet interface to Plant control systems through the Red Lion modular controller interface.

The interface is designed for **monitoring** of the VAULT system status **only**.

The following system parameters can be read from the following memory locations:

PARAMETER	DATA TYPE	RANGE OR STATUS
CELL CURRENT	ANALOG	0-999.9
CELL VOLTAGE	ANALOG	0-99.9
BRINE PUMP VOLTS	ANALOG	0-4.999
SYSTEM HOURS	ANALOG	0-999999.9
WATER PRESSURE	ANALOG	0-999.9
CELL HOURS	ANALOG	0-999999.9
WATER TEMPERATURE	ANALOG	0-999.9
OXIDANT TEMPERATURE	ANALOG	0-999.9
OPERATION WINDOW	ANALOG	1=OP WINDOW
UPPER LEVEL SWITCH	DIGITAL	0= UP; 1= DOWN
LOWER LEVEL SWITCH	DIGITAL	0= UP; 1= DOWN
WATER PRESSURE SWITCH	DIGITAL	0= NOT OK; 1 = OK

Soft Fault – The system shuts down if a soft fault condition is present and will return to function normally without manual intervention when the soft fault input returns to the non-fault state. Exception- the Run/Stop switch must be manually operated.

The following soft fault conditions can be monitored remotely:

Soft Fault Type	Cause
Run/Stop	Run/Stop switch is in the Stop position
Oxidant Tank Full	Tank is full
Undefined Tank Level Inputs	Tank level inputs are invalid inspect float operation and connections.

5601 Balloon Fiesta Parkway, Albuquerque, NM 87113 I 1690 Sumneytown Pike, Suite 150, Lansdale, PA 19446

Hard Fault – The system shuts down if a hard fault condition occurs and will require manual intervention (power cycle) to reset the fault.

The following soft fault conditions can be monitored remotely:

Hard Fault Type	Cause
Low Cell Current	Cell current is inadequate
Rupture Disk Failure	Rupture disk burst
Very High Cell Current	Current reached an excessive level
Low Cell Voltage	Cell voltage is inadequate
Very High Ox Temp	Oxidant temperature is too high
High Brine Pump Voltage	Pump is providing too much brine
Low Pump Voltage	Pump cannot meet demand for brine
Low Water Pressure	Inlet water pressure is inadequate
Low Feed Water Temp	Inlet water temperature is too low
Cell Current Variation	Current imbalance exists in cell
Hardness Monitor	Optional External Hardness Monitor indicates softener failure.
Hydrogen Monitor	Optional External Hydrogen Monitor indicates Hydrogen in sensor area
Dilution Air Failure	Optional External DA system shows a failure
High Water Pressure	Inlet water pressure is too high
Low Feed Water Flow Rate	Feed water flow rate is inadequate
High Feed Water Flow Rate	Feed water flow rate is too high

MIOX VAULT OSG to SCADA COMMUNICATIONS - MODBUS TCP/IP DETAILS

The MIOX Vault OSG system parameters are being transferred via Modbus TCP/IP to a remote device.
The remote device is expected to be able to receive Modbus data in the form of word, long and real data types.

AB Micrologix 1400 PLC Attributes:

PLC Version Compatibility: 3.2.0 and higher

Driver: Modbus TCP/IP Slave

IP Address:	Configurable/Site provided
Mask:	Configurable/Site provided
Gateway:	Configurable/Site provided

Driver Settings
TCP Port: 502
Session Limit: 2

Data Format: All variables are provided in the format of integer. Floating point numbers are multiplied by a base 10 scaling factor, where applicable, to maintain resolution. The received integers will need to be divided but the appropriate value to accurately receive the floating point number.

Please note: Modbus is an open communications standard. Given the many different manufacturers of equipment, the flexibility to interpret and create variations upon the standard makes providing a 'one size fits all configuration', difficult.

Sequence of commands to remotely control Vault OSG.

1. Local Vault OSG:
    a. Place system in Remote mode from front panel display. (Network configuration page).
        i. 40013 will become 1.
    b. Enable Watchdog (Network configuration-Change Settings page).
        i. 00016 will become 1.
2. Remote SCADA:
    a. Place a 1 in 00000 (REMOTE START STOP) to start system.
    b. The register 00032 (WATCHDOG RESET) must be toggled at least every ~5 seconds, otherwise the system will soft fault and shut down.
    c. The heartbeat value is readable at 40004.
    d. The watchdog can also be enabled remotely by placing a 1 in 00016 (WATCH DOG ENABLE).
    e. Remote SCADA: Place a 0 in 00000 (REMOTE START STOP) to stop system.

PAGE LEFT BLANK ON PURPOSE

The SAFEST WATER In The World

VAULT Electrolytic Cell

The VAULT MIOX electrolytic cell is a proprietary membraneless electrolytic cell manufactured by MIOX Corporation that produces sodium hypochlorite. Cell housings for the VAULT series cells are constructed from clear Acrylic. The VAULT series electrolytic cells operate on 30 VDC.

Each electrolytic cell is fully enclosed in machined Acrylic plastic. Electrode plates are constructed of titanium with a proprietary catalytic coating. A diluted brine solution is fed at the bottom of the cell and the sodium hypochlorite is withdrawn from cell exit port at the top of the electrolytic cell.

The MIOX Corporation sodium hypochlorite cell does not produce disinfectant in a batch process. Rather it uses a continuous generation process that delivers a steady stream of disinfectant solution to the storage tank until the on-site generation system receives a signal from the solution tank level switch that the tank is full. When the solution tank low level switch is activated, the on-site generator is reactivated delivering a steady stream of sodium hypochlorite to the solution day tank.

For safety reasons, gas volume in the electrolytic cell is minimized by a rectangular cell design, and each electrolytic cell is housed in a corrosion resistant plastic enclosure. Cell leads are equipped with guards to protect and isolate the operator from accidental shock. Cells are pressure tested to 25 psi.

5601 Balloon Fiesta Parkway, Albuquerque, NM 87113 I 1690 Sumneytown Pike, Suite 150, Lansdale, PA 19446
P: 505-343-0090 888-646-9420 F: 505-343-0093 E: info@miox.com W: www.miox.com www.twitter.com/miox

PAGE LEFT BLANK ON PURPOSE

The feed water connection to the VAULT™ Series OSG comes from the water softener. For optimal efficiency, the recommended feed water temperature range is from 55F to 80F (12-27°C). The allowable feed water temperature range is from 40F to 95F (5-35°C). Feed water temperature must be within the allowable range to avoid damage to the electrolytic cell. The feed water connection is ½" Schedule 80 PVC union. A ¾" Y-strainer is provided in the Operations Kit that must be installed on the inlet plumbing prior to entering into the pluming box. Two ¾" x ½" reducer bushings are also provided to make proper connections with ½" pipe, or maintain ¾" pipe inlet to Y-strainer inlet (site specific). Refer to Figure 11 for details on water inlet connection. Before connecting the water supply to the OSG, flush water through the softener until the water is clean and clear making sure no pipe shavings enter the plumbing manifold.

IPEX RV Sediment Strainers protect critical pipeline components by removing solids and suspended impurities. Clear PVC construction allows for inspection of the screen while in service, whereas the bottom-entry design permits maintenance on the valve while in-line. This Y-pattern strainer is also available in Corzan® CPVC. RV RV Sediment Strainers are part of our complete systems of pipe, valves, and fittings, engineered and manufactured to our strict quality, performance, and dimensional standards.

Valve Availability

Body Material:	PVC, CPVC
Size Range:	1/2" through 4"
Pressure:	232 psi (1/2" to 1"), 150 psi (1-1/4" to 2"), 60 psi (3" to 4")
Seals:	EPDM, or Viton® (FPM)
End Connections:	Socket (IPS), Threaded (FNPT), Flanged (ANSI 150)

RV Series Sediment Strainers

Sample Specification

1.0 Sediment Strainers - RV

1.1 Material

- The valve body, end connectors, and unions shall be made of PVC compound which shall meet or exceed the requirements of cell classification 12454 according to ASTM D1784.

or The valve body, end connectors, and unions shall be made of Corzan® CPVC compound which shall meet or exceed the requirements of 23447 according to ASTM D1784.

- These compounds shall comply with standards that are equivalent to NSF Standard 61 for potable water.

1.2 Seals

- The o-ring seals shall be made of EPDM which shall comply with standards that are equivalent to NSF Standard 61 for potable water.

or The o-ring seals shall be made of Viton® (FPM) which shall comply with standards that are equivalent to NSF Standard 61 for potable water.

1.3 Mesh Screen

- The mesh screen shall be made of PVC compound which shall meet or exceed the requirements of cell classification 12454 according to ASTM D1784.

or The mesh screen shall be made of stabilized PP homopolymer compound, also containing a RAL 7032 pigment, which shall meet or exceed the requirements of Type I Polypropylene according to ASTM D4101-86.

or The mesh screen shall be made of corrosion resistand 304 stainless steel.

1.4 All other wetted and non-wetted parts of the valves shall comply with standards that are equivalent to NSF Standard 61 for potable water.

2.0 Connections

2.1 Socket style

- The IPS socket PVC end connectors shall conform to the dimensional standards ASTM D2466 and ASTM D2467.

or The IPS socket CPVC end connectors shall conform to the dimensional standard ASTM F439.

2.2 Threaded style

- The female NPT threaded PVC end connectors shall conform to the dimensional standards ASTM D2464, ASTM F1498, and ANSI B1.20.1

or The female NPT threaded CPVC end connectors shall conform to the dimensional standards ASTM F437, ASTM F1498, and ANSI B1.20.1.

RV Series Sediment Strainers

Sample Specification (cont'd)

2.3 Flanged style

- The ANSI 150 flanged PVC end connectors shall conform to the dimensional standard ANSI B16.5.

or The ANSI 150 flanged CPVC end connectors shall conform to the dimensional standard ANSI B16.5

3.0 Design Features

- Strainers shall be Y-pattern in style.
- Sizes 1/2" through 2" shall have true union ends.
- Sizes 3" and 4" shall have solid threaded or socket ends.
- It shall be possible to service the valve without removing it from the line.
- PVC strainers shall have a transparent body for evaluation of filter screen condition.
- The filter screens shall be available in ASTM 18, 30, 35, and 50 mesh sizes.

3.1 Pressure Rating

- PVC valve sizes 1/2" through 1" shall be rated at 232 psi at 73°F.
- CPVC valve sizes 1/2" through 2" shall be rated at 232 psi at 73°F.
- PVC valve sizes 1-1/4" through 2" shall be rated at 150 psi at 73°F
- PVC valve sizes 3" through 4" shall be rated at 60 psi at 73°F.
- All sizes of flanged valves shall be rated at no greater than 150 psi at 73°F.

3.2 Markings

- All valves shall be marked to indicate size, material designation, and manufacturers name or trade mark.

3.3 Color Coding

- All PVC valves shall have transparent bodies with end connections color-coded dark gray.

or All CPVC valves shall be color-coded light gray.

4.0 All valves shall be Xirtec® 140 or Corzan® by IPEX or approved equal.

RV Series Sediment Strainers

Technical Data (cont'd)

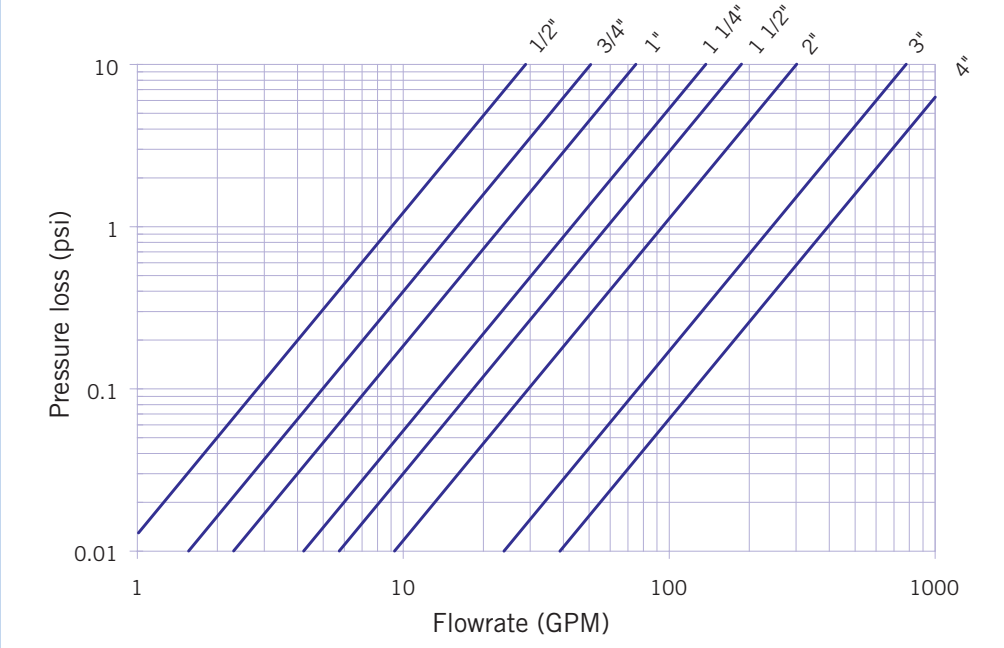
flow coefficients

The flow coefficient (C_V) represents the flow rate in gallons per minute (GPM) at 68°F for which there is a 1 psi pressure drop across the valve in the fully open position. These values are determined from an industry standard testing procedure which uses water as the flowing media (specific gravity of 1.0). To determine specific flow rate and pressure loss scenarios, one can use the following formula:

$$f = sg \times \left(\frac{Q}{C_V}\right)^2$$

Where,

f is the pressure drop (friction loss) in psi,



sg is the specific gravity of the fluid,

Q is the flow rate in GPM,

C_V is the flow coefficient.

Size	C_V
1/2	2.80
3/4	4.90
1	7.21
1-1/4	13.2
1-1/2	17.9

RV Series Sediment Strainers

Installation Procedures

True Union Style

1. For socket and threaded style connections, remove the union nuts (part #11 on previous pages) and slide them onto the pipe. For flanged connections, remove the union nut / flange assemblies from the valve.
2. Please refer to the appropriate connection style sub-section:
   a. For socket style, solvent cement the end connectors (10) onto the pipe ends. For correct joining procedure, please refer to the section entitled, *"Joining Methods – Solvent Cementing"* in the IPEX Industrial Technical Manual Series, *"Volume I: Vinyl Process Piping Systems"*. **Be sure to allow sufficient cure time before continuing with the valve installation.**
   b. For threaded style, thread the end connectors (10) onto the pipe ends. For correct joining procedure, please refer to the section entitled, *"Joining Methods – Threading"* in the IPEX Industrial Technical Manual Series, *"Volume I: Vinyl Process Piping Systems"*.
   c. For flanged style, join the union nut / flange assemblies to the pipe flanges. For correct joining procedure, please refer to the section entitled, *"Joining Methods – Flanging"* in the IPEX Industrial Technical Manual Series, *"Volume I: Vinyl Process Piping Systems"*.
3. Ensure that the valve is in the correct orientation (the bonnet should be suspended in a downward direction), and that the socket o-rings (9) are properly fitted in their grooves. Carefully place the valve in the system between the two end connections.
4. Tighten both union nuts and the lock nut (7). Hand tightening is typically sufficient to maintain a seal for the maximum working pressure. **Over-tightening may damage the threads on the valve body and/or the nut, and may even cause the nut to crack.**

Non True Union Style

2. Please refer to the appropriate connection style sub-section:
   a. For socket style, ensure that the valve is in the correct orientation (the bonnet should be suspended in a downward direction) then solvent cement the end connections of the valve body (1) to the pipe ends. For correct joining procedure, please refer to the section entitled, "Joining Methods – Solvent Cementing" in the IPEX Industrial Technical Manual Series, "Volume I: Vinyl Process Piping Systems". **Ensure that no excess solvent runs into the body as this would cause severe damage to internal components and render the strainer inoperative. Be sure to allow sufficient cure time before continuing with the valve installation.**
   b. For threaded style, ensure that the valve is in the correct orientation (the bonnet should be suspended in a downward direction) then thread the pipe ends into the valve body (1). For correct joining procedure, please refer to the section entitled, *"Joining Methods – Threading"* in the IPEX Industrial Technical Manual Series, *"Volume I: Vinyl Process Piping Systems"*.
   c. For flanged style, ensure that the valve is in the correct orientation (the bonnet should be suspended in a downward direction) then join to the pipe flanges. For correct joining procedure, please refer to the section entitled, *"Joining Methods – Flanging"* in the IPEX Industrial Technical Manual Series, *"Volume I: Vinyl Process Piping Systems"*.
3. Ensure that the bonnet (3, size 3") or lock nut (7, size 4") is sufficiently tightened. Hand tightening is typically sufficient to maintain a seal for the maximum working pressure. **Over-tightening may damage the threads on the valve body and/or the nut, and may even cause the nut to crack.**

RV Series Sediment Strainers

Valve Maintenance

disassembly

1. If removing the valve from an operating system, isolate the valve from the rest of the system. **Be sure to depressurize and drain the isolated branch and valve before continuing.**
2. For true union style, loosen both union nuts (11) and drop the valve out of the line. If retaining the socket o-rings (9), take care that they are not lost when removing the valve from the line.
3. For sizes 1/2" through 2" and 4":
   a. Loosen the lock nut (7) – bonnet (3) assembly and remove from the valve body (1).
   b. Remove the split ring (8) to separate the lock nut from the bonnet.
   c. Remove the retaining ring (6) and slide the screen mesh (2) out of the screen support (4).
   d. Remove the o-ring seal(s) (5) from the bonnet.
4. For size 3":
   a. Loosen the bonnet (3) and remove from the valve body (1).
   b. Remove the retaining ring (6) and slide the screen mesh (2) out of the screen support (4).
   c. Remove the o-ring seal(s) (5) from the groove on the valve body.
5. The valve components can now be checked for problems and/or replaced.

assembly

Note: Before assembling the valve components, it is advisable to lubricate the o-rings with a water soluble lubricant. **Be sure to consult the "IPEX Chemical Resistance Guide" and/or other trusted resources to determine specific lubricant-rubber compatibilities.**

1. For sizes 1/2" through 2" and 4":
   a. Properly fit the o-ring seal(s) (5) onto the bonnet (3).
   b. Insert the screen mesh (2) into the screen support (4) and fasten with the retaining ring (6).
   c. Place the lock nut (7) over the bonnet then fit the split ring (8) in the groove to lock in position.
   d. Insert the screen and lock nut – bonnet assembly into the valve body (1) and tighten.
2. For size 3":
   a. Properly fit the o-ring seal (5) onto the bonnet (1).
   b. Insert the screen mesh (2) into the screen support (4) and fasten with the retaining ring (6).
   c. Insert the screen assembly into the valve body.
   d. Tighten the bonnet (3) into the valve body.
3. For true union style, ensure that the socket o-rings (9) are properly fitted in their grooves, place the end connectors (10) into the union nuts (11), then tighten onto the valve body.

RV Series Sediment Strainers

Testing and Operating

The purpose of system testing is to assess the quality of all joints and fittings to ensure that they will withstand the design working pressure, plus a safety margin, without loss of pressure or fluid. Typically, the system will be tested and assessed in sub-sections as this allows for improved isolation and remediation of potential problems. With this in mind, the testing of a specific installed valve is achieved while carrying out a test of the overall system.

An onsite pressure test procedure is outlined in the IPEX Industrial Technical Manual Series, *"Volume I: Vinyl Process Piping Systems"* under the section entitled, *"Testing"*. The use of this procedure should be sufficient to assess the quality of a valve installation. **In any test or operating condition, it is important to never exceed the pressure rating of the lowest rated appurtenance in the system.**

Important points:

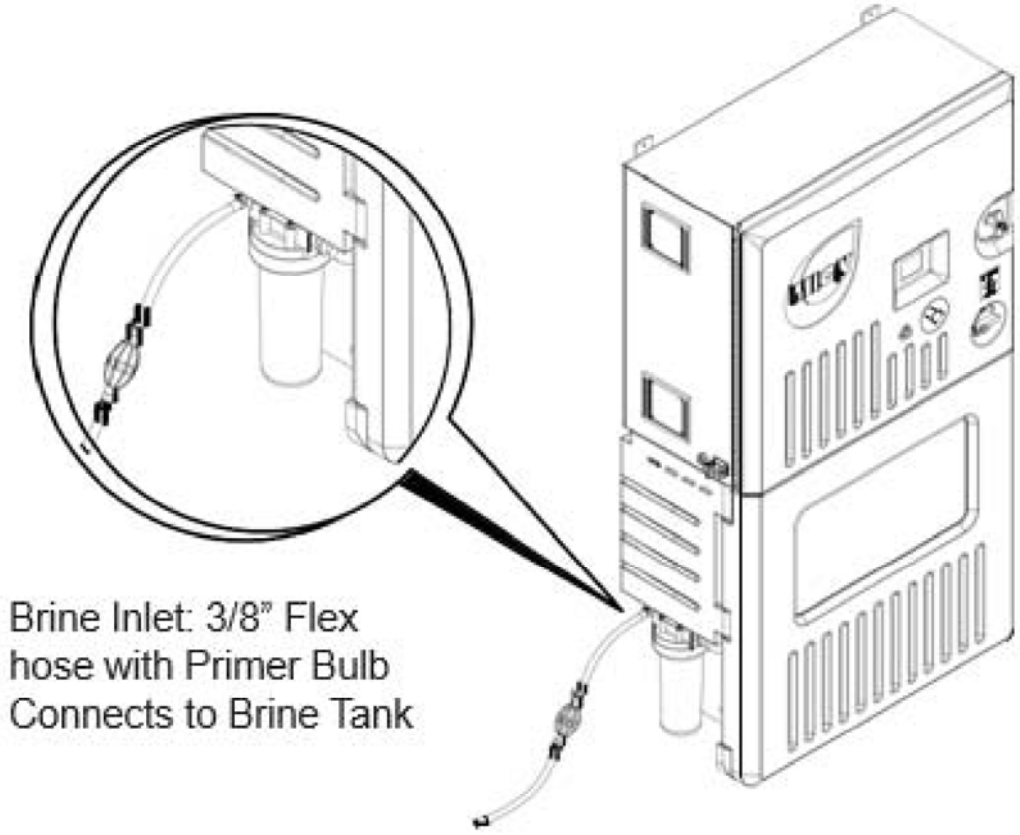
- Never test thermoplastic piping systems with compressed air or other gases including air-over-water boosters.
- When testing, do not exceed the rated maximum operating pressure of the valve.
- Avoid the rapid closure of valves to eliminate the possibility of water hammer which may cause damage to the pipeline or the valve.
- **To eliminate any possible damage to the filter screen, the design of the system should ensure that reverse flow conditions cannot occur.**
- **Transparent PVC strainers:**
  - **Allow light into the process flow facilitating the growth of micro-organisms.**
  - **Are not protected against UV radiation, reducing its lifetime in open air use.**
  - **Must be protected against vibrating stresses in proximity to pumping stations.**
- **Always check the cleanliness of the filtering screen.**

Please contact IPEX customer service and technical support with regard to any concern not addressed in this data sheet or the technical manual.

PAGE LEFT BLANK ON PURPOSE

Brine Feed Connection

The brine feed connection to the VAULT™ Series OSG is 3/8" tube with the appropriate adapter fitting. The OSG is equipped with a 3/8" barb fitting on the inlet of the brine filter assembly. Connection to the barb fitting is made with 3/8" ID x 5/8" OD flexible clear tubing supplied in the operations kit. A primer bulb is also included in the operations kit and should be placed in-line upstream of filter assembly but as close to the unit as possible. The primer bulb will aid in removing air bubbles for brine delivery to the cell. (Figure 12)



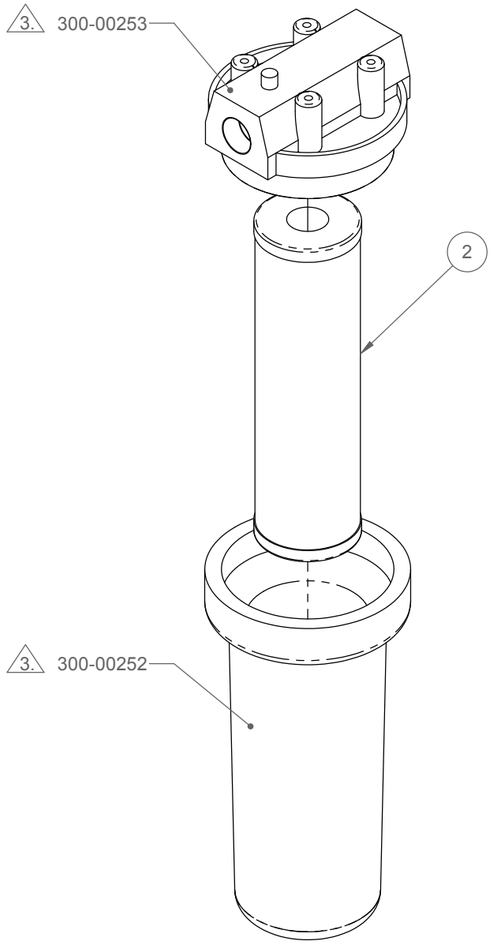


Figure 12 Brine Feed Connection

Note: On initial start-up, cell replacement or when brine plumbing connections are modified, air is introduced to the brine line. This air must be removed for proper operation of the brine pump. Air locks in the brine line will prohibit consistent brine flow to the cell.

FILTRATION
SYSTEMS

PENTEK® Standard

Filter Housings

Pentek Standard Filter Housings are manufactured with reinforced polypropylene housings have excellent chemical resistance and are ideal for many residential, commercial and industrial applications.

Standard Filter Housings are manufactured of a durable polypropylene or clear FDA-compliant Styrene-Acrylonitrile (SAN). All are equipped with 3/4" NPT inlet and outlet ports. Standard filter housings are available in both 10" and 20" lengths and will accommodate a wide range of 2-1/2" to 2-7/8" diameter cartridges.

The reinforced polypropylene cap and offers an optional pressure-relief button on the inlet side to relieve pressure inside the housing when changing filter cartridges.

Opaque Standard Filter Housings offer outstanding chemical compatibility and are ideal for use in a variety of low-flow applications. These applications include many residential, commercial and industrial filtration requirements.

Clear Standard Filter Housings offer on-site examination of flow, performance, and cartridge life. They are also ideal for a variety of applications.

Manufactured of clear, Styrene-Acrylonitrile (SAN), the sumps are annealed to relieve stress, adding clarity and strength.

Product Features

- Ideal for a wide range of applications, including residential, commercial and industrial
- Available in 10" and 20" lengths
- Optional pressure-relief/bleed button on inlet side of cap
- Thick walls for increased strength
- Leak-proof sealing with top-seated Buna-N o-ring
- Available with clear or opaque sumps

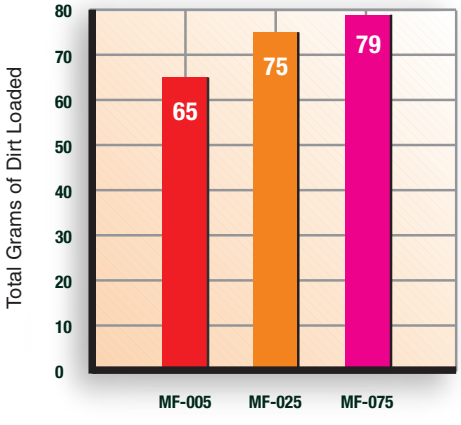
Innovative Solutions. Clear Results.

The New Vorex
FILTER CARTRIDGE

The new and improved VOREX FILTER CARTRIDGE is designed for higher efficiency and fewer changeouts. The extensive research invested in the development of this filter has resulted in a superior filter cartridge that works better and lasts longer. The exclusive manufacturing process thermally bonds pure polypropylene microfibers. Lower density fibers are at the surface and sequentially higher density fibers are used toward the center, therefore particles are trapped more evenly throughout the entire cross section.



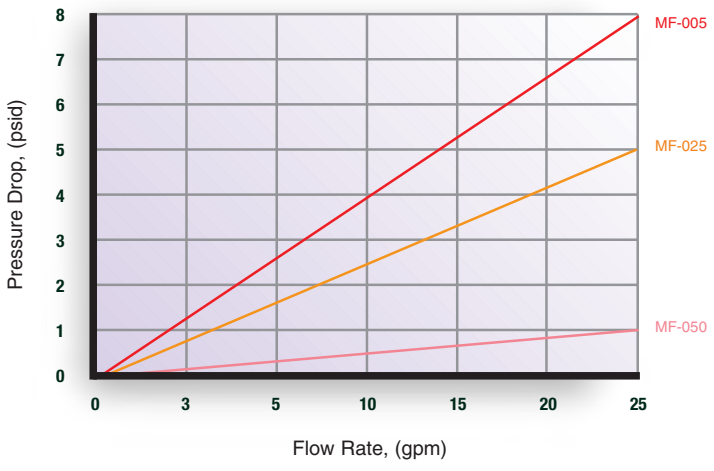
The Vorex is a nominally rated filter that works well as either a pre-filter or final filter in a wide range of applications including industrial, chemical process, food/beverage, cosmetics and water applications. *Meets FDA requirements.

Vorex
FILTER CARTRIDGE

The Vorex Advantage

- *Greater dirt holding—longer life*
- *Fewer filter changeouts*
- *No fiber migration*
- *100% polypropylene*
- *High flow rates with lower pressure drops*
- *Easy disposal (incinerates to non-volatile trace ash)*
- *Supports a wide range of industrial and chemical applications*
- *Very competitive economical pricing*

Dirt Holding Capacity



Many factors can influence cartridge life, like the type of solids loading, viscosity, etc,. For specific applications contact a FSI representative.

Vorex Filters trap contaminants throughout the entire cross section for improved dirt holding capacity and longer life.

Standard microfiber cartridges offer less volume for holding contaminants.

Clear Water Pressure Drop

This chart shows the Vorex filter cartridge life span as related to pressure drop. Results may vary in actual service.

Vorex Filter Cartridges

*Standard lengths listed. Custom lengths available.

I.D. 1.06" O.D. 2.5"

FDA Compliant, NSF Certified Materials The Vorex filter cartridge complies with the appropriate U.S. Food and Drug Administration guidelines, as outlined in the Code of Federal regulations,Title 21, Sections 177.1520 (a), (1) and Section 177.1520 (c), (1.1). This filter is certified by NSF International under ANSI/NSF Standard 42.

The Vorex filter cartridge meets the requirements of a USP Plastic Class VI as demonstrated by USP Biological Reactivity Tests, In Vivo.

There are no expressed or implied warranties given with respect to this product and/or claims of performance. All test results are conducted under standard industry conditions, and actual results may very based on specific applications.

Filter Specialists, Inc. is a leader in filtration products. FSI offers custom cartridge design and manufacturing.

Oxidant Discharge

The standard oxidant discharge connection from the VAULT™ Series OSG is 3/4" union which is provided to connect directly to the oxidant tank via the CPVC pipe. A 2" oxidant (CPVC) transfer pipe, ¾" check valve and ¾" 3-way valve (for sampling) should be included in the plumbing from OSG to Oxidant Tank.

⚠WARNING Do not use any valves in the mixed-oxidant or sodium hypochlorite lines other than the 3-way valve provided by MIOX. These valves have an open center configuration that prevents the blockage of flows from the cell. Failure to use MIOX supplied three-way valves may void the system and cell warranty.

Drain

The plumbing compartment is the only area in the OSG that has the potential for a water leak. The compartment is equipped with low point drains that will drain directly to the floor. The drain from this compartment should only flow in the event of a malfunction that will be evident from liquid underneath the enclosure. If this condition is noticed, immediately shut down the system, diagnose, and correct the leak.

PVC & CPVC TRUE UNION 2000 VALVES

TU2000-2-0605

One of the Most Versatile, Compact Valve Designs Available

Spears® True Union 2000 Ball Valves, 3-Way Ball Valves and Ball Check Valves provide maximum versatility with fully interchangeable valve cartridges. Provides for easier system design modifications and upgrades in multiphase projects, or anywhere changes in valve types are desired. Simply exchange any True Union 2000 valve in-line using existing union nuts. Also mates with Spears® new Schedule 80 Unions and Diaphragm Valves. All True Union 2000 valves feature a low profile, compact design for minimal space requirements. Available in PVC or CPVC with choice of EPDM or Dupont Dow Genuine Viton® O-ring seals and socket, flanged, or optional Spears® patented Special Reinforced (SR) threaded end connectors. Additionally, Spears® offers valve Retrofit Kits for easy in-line replacement of other valves and factory installed Actuation Packages. Assembled with silicone-free lubricant.

True Union 2000 Industrial 3-Way Valve

- Industrial Grade, Multiport, Diverter, L-Pattern & T-Pattern configurations Vertical 3-Way or Horizontal Diverter (shown)
- Built-in Handle Lockout
- Fully Serviceable, Replaceable Components
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- ISO Pattern Actuation Mounting Option
- Spears® Dual O-ring Safe-T-Shear® Stem
- Self Adjusting PTFE Floating Seat Design
- Sizes 1/2” - 2” pressure rated to 235 psi @ 73°F, sizes 2-1/2” - 4” and all flanged to 150 psi @ 73°F
- NSF Certified for Potable Water Use
- Produced in IPS sizes 1/2” - 4” with Socket, Flanged or SR Threaded End Connectors

S4 SPRING CHECK, FOOT, AERATING (VACUUM BREAKER) VALVE - PVC, PP, PVDF

SPECIFICATIONS:

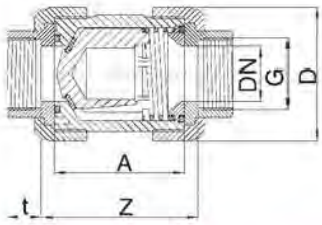
- Sizes: 3/8" - 4" (DN 10 - DN 80)
- Body material: PVC-u - PP - PVDF
- O-rings and check seal: EPDM / FPM (Viton)
- Spring material: 304 stainless, Teflon HASTELLOY-C (optional)
- Foot valve screen material: PP

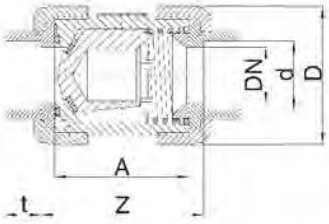
Operating pressure:

3/8" - 2 1/2" 232 psi (16bar)
3" 145 psi (10 bar)
4" 87 psi (6 bar)

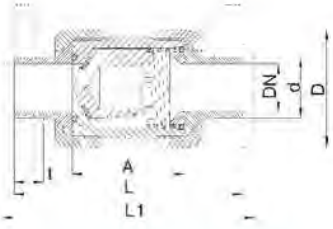
Valve ends:

- Solvent cement socket (ASTM, DIN, JIS)
- Solvent cement spigot (DIN)
- Threaded socket (BSP, NPT)
- Flanged (ANSI, ASA, DIN, JIS)





FEATURES:



- corrosion resistant
- radial installation or removal
- low pressure loss
- suitable for high flow rates
- quick and exact closing and opening
- suitable for liquids with very low specific gravity

Sample Specification:

All Praher s4 series spring check valves, sizes 3/8" - 4" shall be of true union design. The internal spring loaded check design shall guarantee leak tight seating in extreme low pressure and vertical installations. Minimum spring load of 1 lb., spring shall be 304 stainless steel, teflon encapsulated stainless steel or Hastelloy-C. All O-rings and check seals shall be EPDM or VITON and shall meet NSF61 criteria. Union ends shall be interchangeable with s4 series ball valves. PVC shall be NSF61 listed and meet ASTM D1764-cell class 12454. PP shall be conforming to ASTM D4101, cell class PP0210B67272. PVDF shall be conforming to ASTM 3222 cell class type II.

PRAHER VALVES

3-Way Valve & Check Valve Replacement

Above picture is a depiction of a CPVC Valve (red handle) and Check Valve (to the right of the valve and has the appearance of a union)

CAUTION

The new vales are not direct field replacements for existing valves.

These new valves are constructed with threaded ends, and will require additional modification to the existing plumbing. This additional modification is likely to include a threaded nipple (cut in half), and two couplers to adapt to the existing plumbing for each valve.

Municipal Customer Service

PAGE LEFT BLANK ON PURPOSE

SECTION C
OSG Acid Washing Kit/Procedure

PAGE LEFT BLANK ON PURPOSE

Acid Washing Cell

Water with hardness of greater than 1 grain/gallon (17.1 mg/L as CaCO3) feeding the MIOX generator will coat the plates within the cell with solid impurities such as calcium carbonate. Calcium carbonate (CaCO3) is usually white in color but can be other colors depending on dissolved salts in the water. If there is a problem, CaCO3 will most likely be found on the cathode side of the cell. At first, CaCO3 will form a thin hard fi lm and over time, a coating within the cell will grow and flakes will break off and effect system performance. CaCO3 will obstruct, or “blind” the current path and cause a decrease in mixed oxidant (chlorine) production. If uncorrected, the cell can be damaged.

Actions

1. Acid washing the cell according to the procedure written below.
2. Ensure that the water supplied to the cell meets hardness and purity requirements under Appendix A
3. Ensure that the salt supplied to the cell meets with calcium and magnesium requirements under Appendix B

Equipment Needed

Acid Wash Kit Components (Supplied by MIOX in Operations Kit)

1. Acid wash cell union assembly
    a. Union, ¾” CPVC (only the female half is needed)
    b. Reducer, ¾”S x 1/2”Th CPVC
    c. 1/2” MT x 3/8” TB, JG Adapter, PVDF
2. (2) two lengths of 3/8” polyethylene (PE) tubing (7-ft and 5-ft)

Acid Wash Components (not supplied by MIOX)

1. (2x) 5 gallon buckets or similar containers
2. Latex ‘acid’ gloves
3. Face shield
4. Apron
5. Paper towels or rags – 1 Roll
6. Soft Water
7. Acid (hydrochloric acid, muriatic acid, citric acid)
8. Ph Strips

The system must be in Stop Mode prior to beginning the acid wash procedure

Step 1 – Draining the Cell
Tools/Parts Required: 5-gallon bucket, paper towels, 5 foot long 3/8” PE tube

Vault system should be in Standby before proceeding (Refer to the Operations Section of the Manual if you have any questions)

- Place the Run/Stop switch in the Stop position, system will display Stop Mode when performed correctly
- Do not turn OFF all power to the OSG; you will need the Diagnostics Menu. The two fans will continue to run; it is OK to perform maintenance on the system while the fans are running
- Position the 3-way valve on the Oxidant Transfer Line to the drain position. This isolates the OSG from the Solution Storage Tank
- Open the bottom plumbing door and install the 5 foot long PE tube into the blue handle drain valve. Route the other end of the PE Line into a 5-gallon bucket or to a nearby drain

This tubing will be used again to connect the brine pump suction to the bucket

- Drain the cell by opening the blue handle drain valve on the inlet manifold. (See Figure 6-4)

Figure 6-4 Draining the Cell

- Allow for cell to drain for 20-30 seconds then loosen (crack open) the 1/2” female union on the right hand side of the oxidant outlet piping just before it leaves the cell/plumbing cabinet. (See Figure 6-5)

Figure 6-5 Cell Drain - Female Union

- Once the union and drain lines are opened, water will begin to drain from the cell and oxidant plumbing line
- Discard drained water from the cell

- After the cell is drained, close the blue handle drain valve on the inlet manifold and remove the 5 foot long PE tube (refer to Figure 6-4)
- Tighten the female fitting loosened in the previous step
- Capture or soak up any drained water that may have spilled onto plumbing enclosure floor

Ensure that all spilled liquid is cleaned up immediately to prevent corrosion to electrical and metallic fittings

Step 2 – Preparing the Brine Pump Acid Recirculation
Tools/Parts Required: 3/8” PE tubing (7 foot long and 5 foot long), acid wash cell union assembly, 5-gallon bucket

- Remove the tubing from pump inlet quick disconnect fitting (see Figure 6-6)

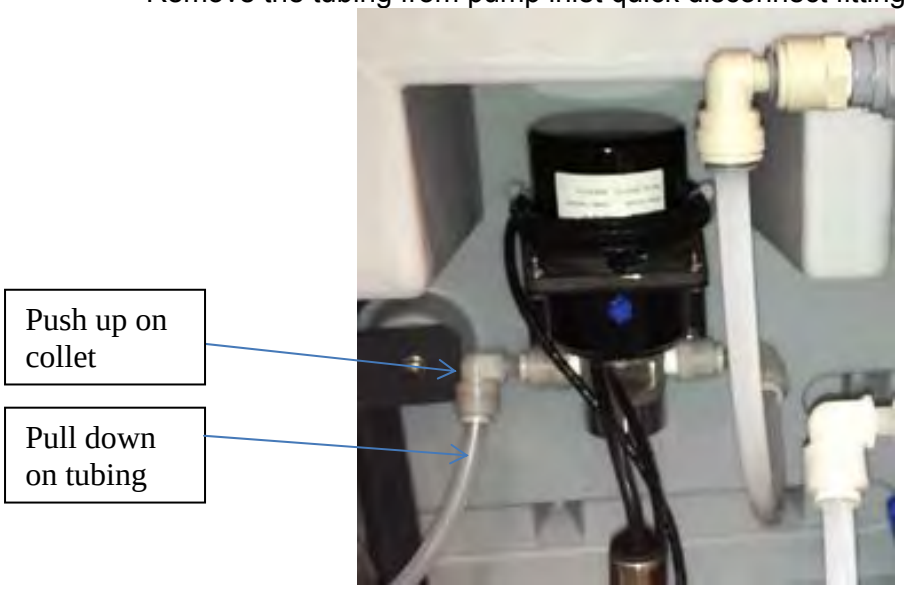

Figure 6-6 Removing Tubing from Pump Inlet

- Route PE tube (5 foot tubing) from **Step 1: Draining the Cell** and insert it into the brine pump inlet quick disconnect fitting
- The other end of the tubing should be inserted into the 5 gallon bucket.
- The brine pump will suction the acid/water solution from the bucket during the acid washing procedure
- Remove the PE tube with 3/8” stem and Elbow from the brine pump check valve and attach it to the blue handled JG valve used to drain the cell in Step 1 (see Figure 6-7)

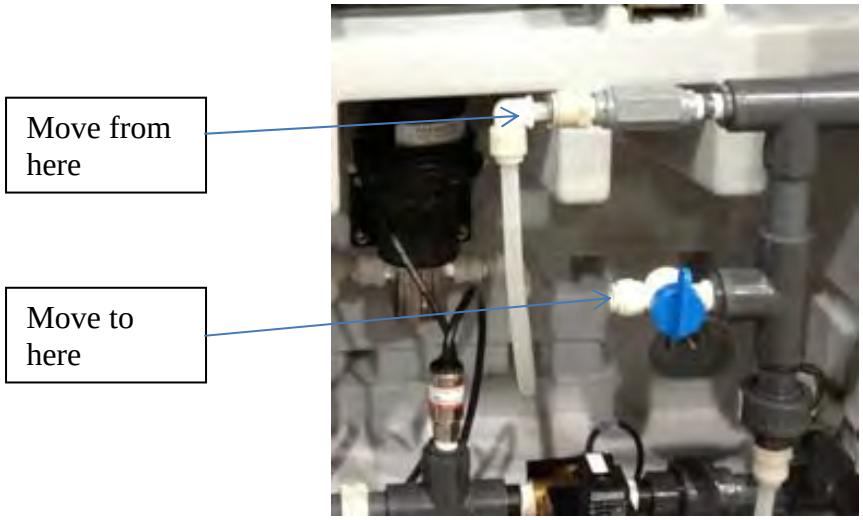

Figure 6-7 Attach new PVDF to blue handle drain valve

- Remove the ¾” oxidant union assembly (female half) on the outside of the cabinet from the male union half
- Replace the union with the ¾” acid wash cell union assembly and 7 foot tube supplied in the Acid Wash Kit
- Route the other end of this line into the 5-gallon bucket. This will allow acid to be discharged from the cell and provide a return path to the 5-gallon bucket during the acid washing recirculation procedure (See Figure 6-8)

Figure 6-8 Attaching Acid Wash Union Assembly

Ensure that all spilled liquid is cleaned up immediately to prevent corrosion to electrical and metallic fittings

Step 3 – Preparing the Acid/Water Mixture
Tools/Parts Required: acid, water, latex gloves, apron, and face shield

Follow the manufacturer's safety instructions when handling acids

- The drain on the cell will NOT permit complete drainage of a cell. Therefore the residual water remaining in the cell is utilized for diluting the acid for a 50/50 mixture.
- In a 5-gallon bucket or similar container prepare one of the following acid solutions.

Refer to Table 6-1 to determining the appropriate volumes of acid and water to generate a 6N HCL acid solution (50/50 mixture)

Table 6-1 Acid Solution

	M15/H25	M30/H50	M45/H75	M60/H100
Total Cell Volume (mL)	1100	2200	3300	4400
Cell Residual Drain Volume (mL)	90	180	270	360
Acid Volume (mL)	550	1100	1650	2200
Water added Volume (mL)	460	920	1380	1840

If weaker acid solutions are chosen, they are still effective. They will sufficiently clean the cell if allowed to sit longer

Example #1

- To make a 6N HCl acid solution, using an M30/H50 cell, add 1100 mL of 37% hydrochloric acid into 920 mL of water. The 180 mL of water that remain in the cell, when mixed with the acid, will provide the proper dilution ratio

- Muriatic acid (31% hydrochloric acid) can be mixed in the same ratio as above. However this is a weaker acid solution than 6N HCl (equivalent to a 5N HCl Solution)

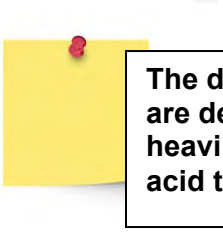
- Citric acid is a weaker acid solution than either 6N HCl or muriatic acid and can be used without dilution

- Follow the manufacturer and local area disposal requirements to safely handle and dispose of the used acid

ALWAYS ADD ACID TO WATER
NEVER ADD WATER TO ACID

Step 4 – Starting the Acid Wash Recirculation
Tools/Parts Required: latex 'acid' gloves, safety glasses, apron, and face shield

Figure 6-11 Acid Wash Recirculation Loop



The system is now ready to begin the acid washing cycle

- From the Main Menu – Enter Diagnostic by pressing on the DIAGNOSTIC button
- Locate Brine Pump Voltage and click on the light blue window (0.00) and a new window will open
- Enter 3 and press on the large check mark to register the new value on the display
- When performed correctly the brine pump will turn ON and the new value will be displayed (3.0)

If acid solution does not begin to flow immediately, it may be necessary to carefully raise the bucket level above the brine pump level for a flooded suction of the pump. Once flow is established the bucket can be returned to the floor

- Allow the pump to circulate acid/water mixture for about 25-30 minutes (50-60 minutes if using a weaker acid solution or if cell is heavily calcified)
- Follow the same procedure to return Brine Pump Volts 0.0 and turn the brine pump OFF
- When finished acid washing, properly dispose of remaining mixture.

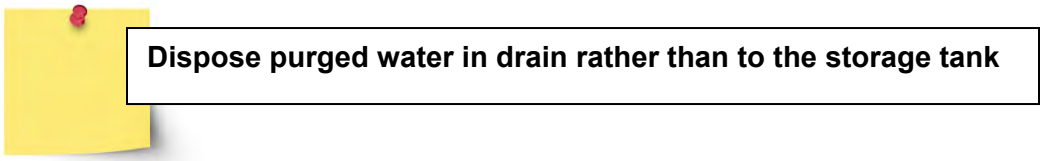
The duration requirements for acid recirculation within the cell are dependent on type of acid and mineral deposits. If the cell is heavily calcified it may be necessary to prepare a new batch of acid to circulate another cycle

Step 5- Acid Removal
Tools/Parts Required: 2nd 5-gallon bucket, latex 'acid' gloves, safety glasses, apron, and face shield

- Fill the 2nd 5-gallon bucket with water and set near by
- With brine pump voltage at 0.00
- Carefully remove the suction line from the 5-gallon bucket with the acid/water mixture
- Place the suction tubing into the a 2nd 5-gallon bucket filled with clean water (used to rinse the cell). Two buckets are now being used simultaneously – one to supply fresh water (supply bucket), the other to collect cell discharge (collection bucket)
- Enter a brine pump voltage of 3.0.
- When the collection bucket is near full, enter a brine pump voltage of 0.0 to turn OFF the brine pump
- Discard water/acid mixture from the collection bucket in accordance to local area and manufacturer's recommendations for proper disposal
- Re-fill the supply bucket with clean water and repeat the process above for rinsing the cell/pump
- When the collection bucket is near full for the second time, enter a brine pump voltage of 0.0 to turn OFF the brine pump
- Discard both buckets in accordance to local area and manufacturer's recommendations for proper disposal

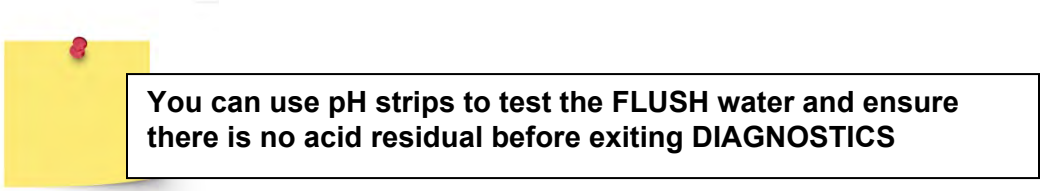
Step 6 – Drain the cell
Tools/Parts Required: 5-gallon bucket, paper towels, 5 foot long PE tubing

- Shut the blue handle drain valve closed
- Disconnect the PE tube with 3/8" stem and Elbow from the blue handle drain valve and move it up to the brine check valve (Reference Figure 6-7)
- Remove the 5 foot long PE tube from the brine pump inlet (suction side) and install it into the blue handle drain valve
- Route the other end of the PE Line to a 5-gallon bucket or to a nearby drain
- Drain the cell by opening the blue handle drain valve on the inlet manifold
- Allow the cell to drain for 20-30 seconds then loosen (crack open) the 1/2" female union on the right hand side of the oxidant outlet piping just before it leaves the cell/plumbing cabinet
- Once the union and drain lines are opened, water will begin to drain from the cell and oxidant plumbing line
- Discard drained water from the cell
- After the cell is drained, close the blue handle drain valve and remove the 5 foot long PE tube
- Tighten the female union loosened in the previous step
- Capture or soak up any drained water that may have spilled onto plumbing enclosure floor



Ensure that all spilled liquid is cleaned up immediately to prevent corrosion to electrical and metallic fittings

Step 7 – Return Cell and Pump Plumbing to Normal Operating Conditions
Tools required: 5-gallon bucket, paper towels or rags.



- Install the tubing to the pump inlet (coming from brine solenoid) (from Figure 6-6)
- Remove the acid wash ¾" cell union assembly and reconnect the oxidant exit plumbing union
- Verify the blue handle drain valve on the inlet manifold is closed.

The acid washing kit has now been removed. Please look over and tighten any fitting that may be loose and ensure a closed loop within the plumbing cabinet

Step 8 – Cell Water Flush
Tools Required: None

- Enter DIAGNOSTICS
- Initiate a flush by pushing the FLUSH button
- Allow the system to flush fresh water through the cell for 10 minutes to remove any residual acid that may remain in the cell
- End the flush by the pushing the FLUSH button again
- Exit DIAGNOSTICS by pressing the MAIN MENU button
- Position the 3-way valve on the oxidant discharge line (outside of the OSG cabinet) to the tank position
- The system is now ready for standard operation

Step 9 – System Re-start
Tools Required: None

- Re-start the system in accordance with the operations and maintenance manual
- While the system stabilizes water flow, continually check for leaks in the plumbing compartment
- Monitor system operations for 15 to 20 minutes after the acid wash

This Concludes the Procedure

TRADITIONAL STANDARD SERIES
FILTER HOUSINGS

EXCELLENT CHEMICAL RESISTANCE FOR MANY RESIDENTIAL, COMMERCIAL AND INDUSTRIAL APPLICATIONS

Pentair Standard Filter Housings are manufactured of a durable polypropylene or clear Styrene-Acrylonitrile (SAN). All are equipped with 3/4" NPT inlet and outlet ports. Standard Filter Housings are available in both 10" and 20" lengths and will accommodate a wide range of 2-1/2" to 2-7/8" diameter cartridges. The reinforced polypropylene cap offers an optional pressure-relief button on the inlet side to relieve pressure inside the housing when changing filter cartridges.

Reinforced polypropylene housings have excellent chemical resistance and are ideal for many residential, commercial and industrial applications. Clear sumps offer on-site examination of the cartridge.

Opaque Standard Filter Housings are molded from rugged reinforced polypropylene. They offer outstanding chemical compatibility and are ideal for use in a variety of low-flow applications.

Clear Standard Filter Housings offer on-site examination of flow, performance, and cartridge life. They are ideal for a variety of applications.

FEATURES/BENEFITS

Ideal for a wide range of applications, including residential, commercial and industrial

Available in 10" and 20" lengths

Thick walls for increased strength

Optional pressure relief/bleed button on inlet side of cap

Leak-proof seal

Available with clear or opaque sumps

SPECIFICATIONS

Housing – Polypropylene (opaque) or Styrene Acrylonitrile (clear)

Cap – Reinforced polypropylene

Button Assembly – 300 Series stainless steel, EPDM, and polypropylene

O-Ring – EPDM

Temperature Rating– 40-125°F (4.4-51.7°C)

Maximum Pressure – 125 psi (8.6 bar)

NSF COMPONENT

The 150001, 150002, 150067, 150068, 150071, 150072, 150328, 150435 and 150436 are Tested and Certified by NSF International to NSF/ANSI Standard 42 for material and structural integrity requirements.

Vorex Filter Cartridges

Introduction

The new and improved Vorex filter cartridge is designed for higher efficiency and fewer changeouts.

Our Vorex filters are manufactured through an exclusive process that thermally bonds pure polypropylene microfibers. Lower density fibers are at the surface and sequentially higher density fibers are used toward the center. This process traps particles more evenly throughout the cross section.

The Vorex is a nominally rated filter that works well as either a pre-filter or final filter in a wide range of applications including industrial, chemical process, food & beverage, cosmetics and water.

FDA Compliant, NSF Certified Materials

FSI offers filter cartridges which meet FDA guidelines and are certified under NSF standards:

- FSI's polypropylene microfiber media complies with the appropriate U.S. Food and Drug Administration guidelines, as outlined in the Code of Federal regulations, Title 21, Sections 177.1520 (a), (1) and Section 177.1520 (c), (1.1).
- Vorex filter cartridges are certified by NSF International under ANSI/NSF Standard 42.

HOW TO ORDER

Example: CMMF02520

Type of Filter:
CM = Meltblown cartridge

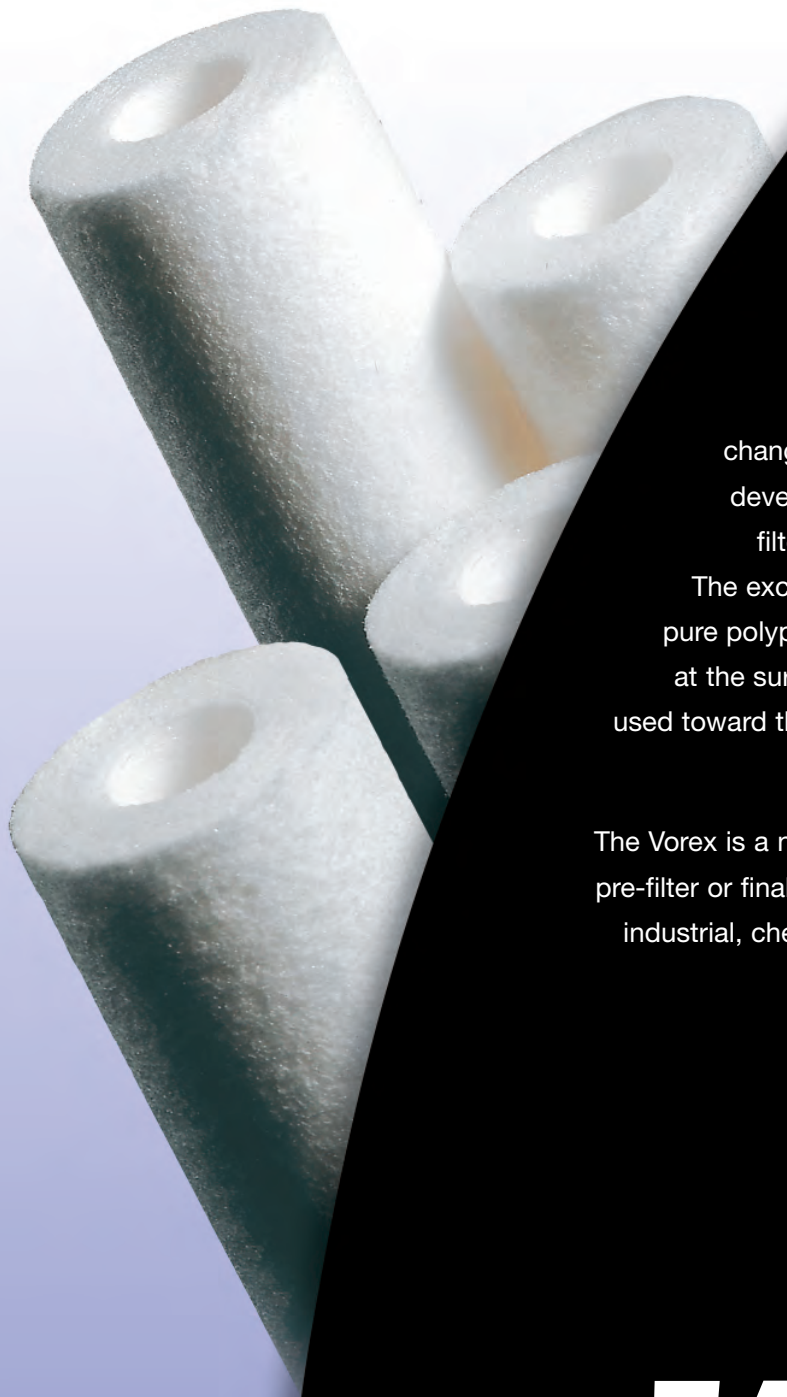
Material:
MF = Microfiber
MFGF = Microfiber, glazed finish

Micron Rating:
001, 005, 010, 025, 050, 075, 100 and 150

Length*:

9.75"	29.5"
10"	29.75"
19.5"	30"
19.75"	39"
20"	39.5"
29.25"	39.75"
	40"

NOTE:
* = Standard lengths listed. Custom lengths available.



- Vorex filter cartridges meet the requirements of a USP Plastic Class VI as demonstrated by USP Biological Reactivity Tests, In Vivo.

Features:

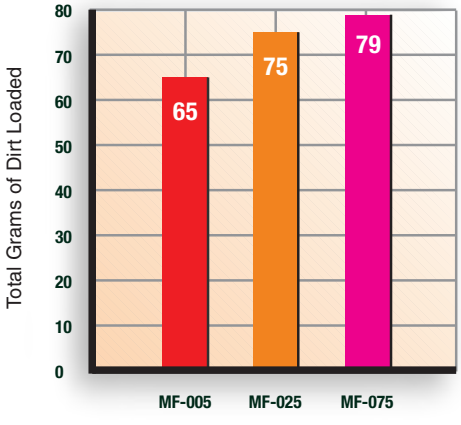
- Greater dirt holding – longer life
- Fewer filter changeouts
- No fiber migration
- 100% polypropylene
- High flow rates with lower pressure drops
- Easy disposal (incinerates to non-volatile trace ash)
- Supports a wide range of industrial and chemical applications
- Very competitive economical pricing

NSF COMPONENT

FILTER SPECIALISTS, INC.
Innovative Solutions. Clear Results.

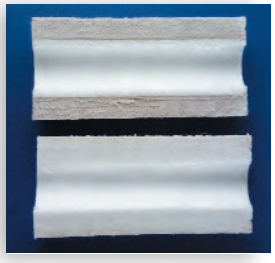
The New Vorex
FILTER CARTRIDGE

The new and improved VOREX FILTER CARTRIDGE is designed for higher efficiency and fewer changeouts. The extensive research invested in the development of this filter has resulted in a superior filter cartridge that works better and lasts longer. The exclusive manufacturing process thermally bonds pure polypropylene microfibers. Lower density fibers are at the surface and sequentially higher density fibers are used toward the center, therefore particles are trapped more evenly throughout the entire cross section.



The Vorex is a nominally rated filter that works well as either a pre-filter or final filter in a wide range of applications including industrial, chemical process, food/beverage, cosmetics and water applications. *Meets FDA requirements.

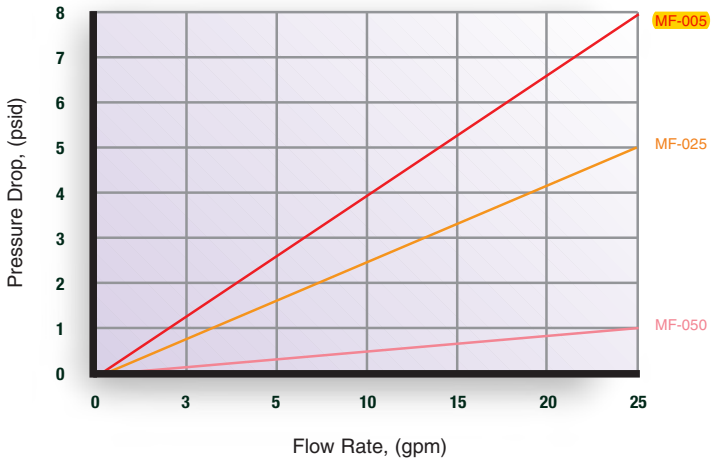
Vorex
FILTER CARTRIDGE



The Vorex Advantage

- *Greater dirt holding—longer life*
- *Fewer filter changeouts*
- *No fiber migration*
- *100% polypropylene*
- *High flow rates with lower pressure drops*
- *Easy disposal (incinerates to non-volatile trace ash)*
- *Supports a wide range of industrial and chemical applications*
- *Very competitive economical pricing*

Dirt Holding Capacity



Many factors can influence cartridge life, like the type of solids loading, viscosity, etc,. For specific applications contact a FSI representative.

Vorex Filters trap contaminants throughout the entire cross section for improved dirt holding capacity and longer life.

Standard microfiber cartridges offer less volume for holding contaminants.

Clear Water Pressure Drop

This chart shows the Vorex filter cartridge life span as related to pressure drop. Results may vary in actual service.

Vorex Filter Cartridges

Example **CM MF 025 2925**
1 2 3 4

Bourdon Tube Pressure Gauges

Stainless Steel Case / Copper Alloy Wetted Parts

Industrial Series Liquid Fillable • Type 21X.53

Pressure Gauges

0-100 PSI

Application
Suitable for environments compatible with copper alloy wetted parts where vibration or pressure pulsation occur and for gaseous or liquid media that will not obstruct the pressure system.

Sizes (All sizes not stocked)
2", 2½", 4" (50, 63, and 100 mm)

Accuracy
± 1.5% of span

Ranges (All ranges not stocked)
Vacuum / Compound to 30"HG / 0 / 200 PSI
Pressure from 15 PSI to 10,000 PSI - 2"
Pressure from 10 PSI to 15,000 PSI - 2½",4"
or other equivalent units of pressure or vacuum

Working Range

2" & 2½"	Steady:	3/4 of full scale value
	Fluctuating:	2/3 of full scale value
	Short time:	full scale value
4" & 6"	Steady:	Full scale value
	Fluctuating:	0.9 x full scale value
	Short time:	1.3 x full scale value

Operating Temperature
Ambient: -40°F to 160°F (-40°C to 71°C) NOTE1
Media: max. 140°F (+60°C)

Temperature Error
Additional error when temperature changes from reference temperature of 68°F (20°C) ±0.4% for every 18°F (10°C) rising or falling. Percentage of span.

Standard Features

Connection
Material: copper alloy
Lower mount (LM)
Center back mount (CBM) - 2" & 2½"
Lower back mount (LBM) - 4"
1/4" or 1/2" NPT limited to wrench flat area
(7/16"-20" SAE thread for **Type 213.53S**)

Bourdon Tube
Material: copper alloy
30"Hg (Vac) to 1000 PSI C-type - 2", 2½"
30"Hg (Vac) to 1000 PSI C-type - 4"
1500 PSI to 15,000 PSI helical type - 2", 2½"
1500 PSI to 15,000 PSI helical type - 4"

Movement
Copper alloy

Dial
White ABS with stop pin and black lettering

Pointer
Black aluminum (external "zero" adjust screw-optional)

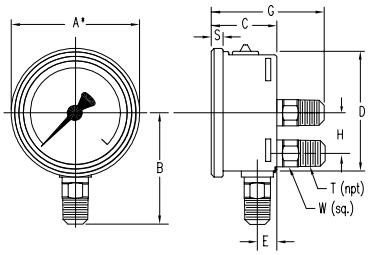
Case
304 stainless steel with vent plug and stainless steel crimp ring.

O-ring (case/connection sealing):
EPDM for standard stocked glycerine filled gauges. Viton for standard stocked dry gauges, suitable for glycerine, silicone or fluoroube case filling

Weather Protection
Weather resistant (NEMA 3 / IP 54) - dry case
Weather tight (NEMA 4X / IP 65) - liquid-filled case

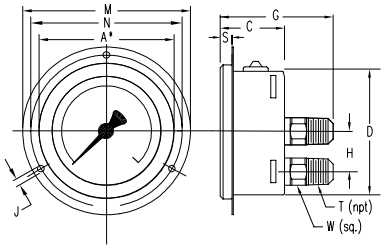
Standard Scale
PSI
PSI, PSI/KG/CM², PSI/BAR (2½")

Window Gasket
Buna-N



Window
Polycarbonate
Acrylic (4")

Case Filling
212.53 - None
213.53 - Glycerine



Order Options (min. order may apply)
Other pressure connections limited to wrench flat area
Stainless steel polished front flange
Stainless steel rear flange- 2½" & 4"
Brass threaded or press-fit restrictor
Pressure compensating membrane window for filled gauges
Dry case (**212.53**)
Steel zinc plated u-clamp bracket (field installable)
Stainless steel u-clamp bracket (field installable)
DIN standards
External zero adjustment (2½" only)
Externally adjustable red drag pointer (max. hand)
Externally adjustable red mark pointer (set pointer)
Other pressure scales available:
Bar, kPa, MPa, Kg/cm² and dual scale
Custom dial layout
Silicone or fluorolube case filling **(Type 213.53)**

Note 1 Temperature Ranges (Liquid filled gauges)
Glycerine: -4°F to 140°F (-20°C to 60°C)
Silicone: -40°F to 140°F (-40°C to 60°C)

PVC & CPVC TRUE UNION 2000 VALVES

TU2000-2-0605

One of the Most Versatile, Compact Valve Designs Available

Spears® True Union 2000 Ball Valves, 3-Way Ball Valves and Ball Check Valves provide maximum versatility with fully interchangeable valve cartridges. Provides for easier system design modifications and upgrades in multiphase projects, or anywhere changes in valve types are desired. Simply exchange any True Union 2000 valve in-line using existing union nuts. Also mates with Spears® new Schedule 80 Unions and Diaphragm Valves. All True Union 2000 valves feature a low profile, compact design for minimal space requirements. Available in PVC or CPVC with choice of EPDM or Dupont Dow Genuine Viton® O-ring seals and socket, flanged, or optional Spears® patented Special Reinforced (SR) threaded end connectors. Additionally, Spears® offers valve Retrofit Kits for easy in-line replacement of other valves and factory installed Actuation Packages. Assembled with silicone-free lubricant.

True Union 2000 Industrial Ball Valve

- Multi-featured Industrial Grade
- Built-in Handle Lockout
- Fully Serviceable, Replaceable Components
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- ISO Pattern Actuation Mounting Option
- Spears® Dual O-ring Safe-T-Shear® Stem
- Self Adjusting PTFE Floating Seat Design
- Sizes 1/2" - 2" pressure rated to 235 psi @ 73°F, sizes 2-1/2" - 6" and all flanged to 150 psi @ 73°F
- NSF Certified for Potable Water Use
- Also Available in **SPEARS® LXT™** High Purity, Low Extractable PVC Material
- Produced in IPS sizes 1/2" - 6" with Socket, Flanged or SR Threaded End Connectors

True Union 2000 Industrial 3-Way Valve

- Industrial Grade, Multiport, Diverter, L-Pattern & T-Pattern configurations Vertical 3-Way or Horizontal Diverter (shown)
- Built-in Handle Lockout
- Fully Serviceable, Replaceable Components
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- ISO Pattern Actuation Mounting Option
- Spears® Dual O-ring Safe-T-Shear® Stem
- Self Adjusting PTFE Floating Seat Design
- Sizes 1/2" - 2" pressure rated to 235 psi @ 73°F, sizes 2-1/2" - 4" and all flanged to 150 psi @ 73°F
- NSF Certified for Potable Water Use
- Produced in IPS sizes 1/2" - 4" with Socket, Flanged or SR Threaded End Connectors

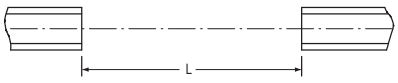
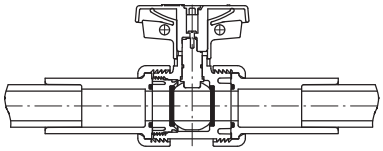
Economical True Union 2000 Standard Ball Valve

- High quality Standard Ball Valve
- Allows future system upgrade
- Excellent for OEM Applications
- Replaceable Seats
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- Spears® Safe-T-Shear® Stem
- Self Adjusting Floating Seat
- Sizes 1/2" - 2" pressure rated to 235 psi @ 73°F, sizes 2-1/2" - 4" and all flanged to 150 psi @ 73°F
- NSF Certified for Potable Water Use
- Produced in IPS sizes 1/2" - 4" with Socket, Flanged or SR Threaded End Connectors
- Also available in PVC White



True Union 2000 Retrofit Valves or Kits



Easily converts any system over to all True Union 2000 style valves for consistent valve type and uniform maintenance. Special extended socket style End Connectors (2) allow retrofit replacement of other brand valves in existing piping systems with a new True Union 2000 valve. Simply cut out old valve according to specified dimension and install retrofit end connectors. End connectors are provided with either EPDM or genuine Viton® O-rings. Can be ordered as End Connector Kit or fully assembled Retrofit Valve.

1: Valve Lay Length
2: Torque required at valve maximum internal pressure rating, 5ft/sec. Flow velocity; due to adjustment differences during installation, actual values may vary.
3: Diverter style valve, no shutoff on branch

3-Way Port Options

True Union 2000 Actuated Valves

Universal ISO Actuator Mounting Pattern Option

Spears® offers optional actuator mounting with standard ISO Mounting Pattern for user actuation of True Union 2000 Ball Valves.

Factory Actuated Valve Packages

Spears® Electric or Pneumatic Actuation Packages eliminate customer's having to determine proper valve and actuator mating. Pre-matched packages insure proper torque, coupling and mount for optimum performance - all factory installed and tested for proper alignment and operation. Actuation packages can be custom built to user specifications from Spears® wide selection of options, voltages and accessories. Contact Spears® for additional information.

Foot Valve Screens

- Easily converts Ball Check Valve to a Foot Valve.
- Standard IPS spigot connection fits slip-socket valve end connector.
- Enlarged screen provides open area equivalent to valve for optimum flow characteristics.
- Chemical and corrosion resistant PVC or CPVC construction.

Typical Application (VALVE NOT INCLUDED)

Split Nut Kit for True Union 2000 Valves & Union 2000 Schedule 80 Fittings

Split Nut Kits are designed to replace broken union nuts on Spears® True Union 2000 Ball Valves and Union 2000 Schedule 80 Unions. Kit includes SS316 Gear Clamp and 2-Split Nut halves. Can also be used if nut was not in place during end connector installation. Split Nut is fully serviceable to original valve pressure rating.

NOT FOR USE WITH COMPRESSED AIR OR GASES

Spears® Manufacturing Company DOES NOT RECOMMEND the use of thermoplastic products to transport or store compressed air or gas.

Viton® is a registered trademark of DuPont Dow Elastomers

KINETICO®

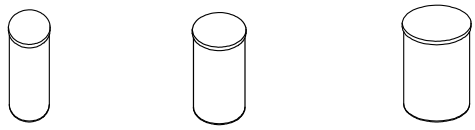
System Components

Media Vessel (qty) Size ..... (2) 8 x 40”
Media Vessel Construction ..... Wrapped Polyethylene
Empty Bed Volume ..... 1.04 ft^3
Media ..... 0.70 ft^3 Non Solvent Cation Resin
Bed Depth / Free Board ..... 25” / 15“
Riser Tube ..... 1” ABS
Distributor Upper ..... 0.014” Slots, ABS Basket
Lower ..... 0.014” Slots, ABS Basket
Under bedding ..... None
Regeneration Control ..... Non-electric Use Meter
Regeneration Type ..... Countercurrent
Meter Type ..... 0.75 - 40.00 gpm Polypropylene Turbine (Kinetico Full Louver Flow Nozzle)
Optional Meter ..... 0.05 - 5.00 gpm Polypropylene Turbine (Kinetico Micro Flow Nozzle)
..... 0.5 - 2500 gpm Polypropylene Turbine (Kinetico Half Louver Flow Nozzle)

Inlet Water Quality

Pressure Range ..... 25 – 125 psi Dynamic Pressure
Temperature Range ..... 35 – 120° F
pH Range ..... 5 – 10 SU
Free Chlorine Cl_2 (Max.) ..... 2.0 mg/l

Operating Specs



Flow, Half Louver and Full Louver (15 psig) ..... 11.5 gpm
Flow, Micro Nozzle (15 psig) ..... 5.0 gpm
Dimensions (width x depth x height) ..... 17 x 8 x 46”
Weight (Operating / Shipping) ..... 200 / 140 lbs.

Connections

Inlet / Outlet Connections ..... Custom Adapter and E-Clip (1 ½” Brass Sweat Fittings Included)
Drain Connection ..... 0.5” Tube
Brine Line Connection ..... 0.375” Tube
Power ..... None

System Part Numbers

CP 208s OD, no brine tank 11700
CP 208s OD, empty, no brine tank 11702
Brine Venturi Nozzle - dark blue (for central brining) 2117
Micro Nozzle (for low flow applications) 10880

Brine Tank Options

Tank Description	24 x 50”	30 x 50”	50 x 60”
Brine Tank Part Number	68370A	68373A	68371A
Brine Tank Internals	4781	4781	4781
Brine Line Check Valve (1 for each softener in parrallel)	7952	7952	7952
Salt Capacity	875 lbs	1,350 lbs	4,500 lbs.
Material	HDPE	HDPE	HDPE
Overflow Connection	5/8” Tube	5/8” Tube	5/8” Tube
Brine Connection	1/2” Tube	1/2” Tube	1/2” Tube

Regeneration Specifications

Regeneration Volume / Time ..... 35 gallons / 45 minutes
Backwash Flow Control ..... 2.00 gpm
Brine Refill Flow Control ..... 0.40 gpm

*Compensated hardness in gpg = Hardness + (3 x Fe in mg/l)

revision date: August 22, 2005

CP 208s, central brining

Operating Profile
Softener shall remove hardness to less than 1/2 gpg when operated in accordance with the operating instructions. The system shall include two tanks. This duplex configuration shall operating in an alternating mode with one tank will be on-line during service. During regeneration cycles, one tank shall provide water to service and to the regenerating tank. A water meter shall initiate system regeneration. The water meter shall measure the processed volume and be adjustable. Service flow shall be down-flow and regeneration flow shall be up-flow.

Regeneration Control Valve
The regeneration control valve shall be top mounted (top of media tank), and manufactured from non-corrosive materials. Control valve shall not weigh more than four pounds. Control valve shall provide service and regeneration control for two media tanks. Inlet and outlet ports shall accept a quick connect, double o-ring sealed adapter. Interconnection between tanks shall be made through the regeneration valve with a quick connect adapter. Control valve shall operate using a minimum inlet pressure of 25 psi. Pressure shall be used to drive all valve functions. No electric hook-up shall be required. Control valve shall incorporate three operational cycles including; service, brine draw and a combined fast rinse and brine refill. Service cycle shall operate in a down-flow direction. The brine cycle shall flow up-flow, opposite the service flow, providing a countercurrent regeneration. Control valve shall contain a fixed orifice eductor nozzle and self-adjusting backwash flow control. The control valve will prevent the bypass of hard water to service during the regeneration cycle.

Media Tanks
The tanks shall be designed for a maximum working pressure of 125 psi and hydrostatically tested at 300 psi. Tanks shall be made of polyethylene and reinforced with a fiberglass wrapping. Each tank shall include a 2.5 in. threaded top opening. Each tank shall be NSF approved. Upper and lower distribution system shall be of a slot design. Distributors will provide even flow of regeneration water and the collection of processed water.

Conditioning Media
Each softener shall include a non-solvent, high capacity cation resin having a minimum exchange capacity of 30,000 grains/ft^3 when regenerated with 15.0 lbs/ft^3. The media shall be solid, of a proper particle size and shall contain no plates, shells, agglomerates or other shapes, which might interfere with the normal function of the water softener.

Brine System
System is designed to work with a central brining system, utilitzing a continuous brine make-up. Brine tank is recommended to include a safety overflow connection to be plumbed to a suitable drain.

PAGE LEFT BLANK ON PURPOSE

Poly Glass™ Vessels

Product Features
- For residential and light commercial water softener/filtration applications
- Slim diameter with capacities from 2 to 49 gallons
- Unmatched for strength and chemical resistance
- 10-year warranty for 6" - 13" vessels
- 5-year warranty for 14" - 16" vessels

Material of Construction
- Inner shell of polyethylene
- Threaded inlet in various sizes

Operating Parameters
- Maximum operating pressure: 150 psi
- Maximum operating temperature: 120°F

Pentair Design Parameters
- Safety factor: 4:1
- Minimum burst at 600 psi
- Tested to 250,000 cycles without leakage

NSF Design Parameters
- Safety factor: 4:1
- Minimum burst at 600 psi
- Tested to 100,000 cycles without leakage

Part no. 40845
Rev 9/05

Requirements for POE Water Softeners under *NSF/ANSI 44*

By Rick Andrew

Cation exchange water softening is a well-known, well-understood technology that is successfully employed in many hard-water regions of North America as well as internationally. There is an American National Standard for testing and certification of these products—*NSF/ANSI 44*. Many readers may be familiar with the concepts of softening capacity, pressure drop, accuracy of the brining system and other requirements of this standard. But do you know the details?

This column will help to provide those details, including the conservative testing requirements and nuances of scope present in the standard. As you will see, the requirements are well thought out based on the considerations involved with the safety and operation of residential water softeners.

A question of scope

NSF/ANSI 44 defines a residential softener as a regenerable cation exchange system with conventional plumbing fittings not exceeding 1.25-inch (31.75 mm) NPS (nominal pipe size). Any softener with an inlet exceeding 1.25 inches is not considered residential, at least for purposes of *NSF/ANSI 44* and falls outside the scope of the standard.

Notice that the definition is not related to resin tank size, amount of cation exchange resin or system salt settings, but is based solely on the inlet size of the control valve. Also note that any physical or magnetic water conditioning systems are outside the scope of *NSF/ANSI 44*, because the standard is limited to cation exchange systems.

Disposable cartridge filters containing cation exchange resin fall outside the scope of the standard. This is because, although some do use cation exchange technology, they are not regenerable.

POE systems under NSF/ANSI 61

In late 2007, the scope of *NSF/ANSI 61* was revised to include POE systems and components. This means that water softeners can be certified either to *NSF/ANSI 44*, *NSF/ANSI 61* or both.

The main difference is that *NSF/ANSI 61* requires only conformance to the material safety requirements. *NSF/ANSI 44* requires conformance to material safety, structural integrity, pressure drop, softening capacity, softening performance, brine accuracy and product literature requirements.

Obviously, *NSF/ANSI 44* is a much more comprehensive standard for POE water softeners than *NSF/ANSI 61*. For this reason, NSF recommends that POE softeners be certified to *NSF/ANSI 44*.

A multitude of tests

A summary of the testing requirements of *NSF/ANSI 44* is included in Figure 1. A formulation review for all materials in contact with drinking water and material extraction test is required to establish that no contaminants leach from the softener at concentrations of toxicological concern.

A total of 100,000 cyclic and 15-minute hydrostatic tests are required to establish the long-term durability of the system as well as its resistance to pressure spikes. A pressure drop test confirms that the softener will not cause a drop of more than 15 psi in line pressure when operated at the manufacturer's rated service flow.

Softener capacity is determined by testing at one half of the manufacturer's rated service flow. The feed water must have a hardness of 20 ± two grains per gallon. Capacity testing is required at the lowest and highest salt settings and the setting closest to the midpoint of the range of salt settings.

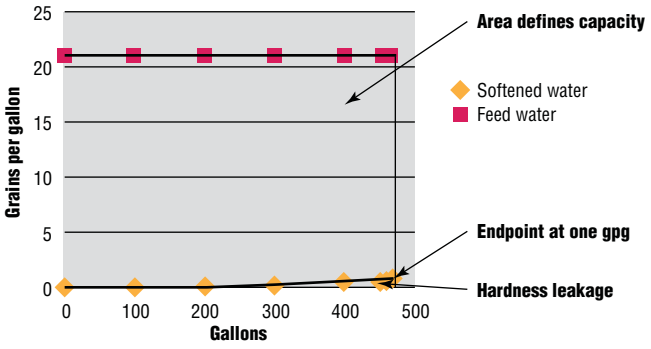
Capacity for other non-tested salt settings is interpolated from the three measured capacities. Extrapolation is not allowed, so testing at the low and high salt settings is critical. Each test of capacity is conducted by first regenerating with a precisely measured amount of saturated brine. The softener's brine system is not utilized due to potential variation in the amount of regenerant salt.

The endpoint of the test is defined as one grain per gallon breakthrough in the softened water. The hardness leakage

Figure 1. NSF/ANSI 44 test descriptions

Requirement	Test description
Material safety	Formulation review for all wetted materials + extraction testing
Structural integrity	100,000 cyclic and 15-minute hydrostatic pressure testing
Pressure drop	Differential pressure between inlet and outlet may not exceed 15 psig at rated service flow
Exchange capacity	Softener challenged at one half of rated service flow with 20 grain per gallon feed water, endpoint when treated water reaches one grain per gallon
Rinse effectiveness	Net chloride in softened water must not exceed 100 mg/L after regeneration
Softening performance	System must produce soft water at rated service flow for 10 minutes after regeneration
Accuracy of the brine system	Salt used for regeneration must be within 15 percent of nominal salt setting

throughout the run is subtracted off when the capacity is determined, so that capacity is reflective of the exact amount of hardness removed. Three successive runs within 10 percent of the average of the three runs are required, with the average value being considered the official capacity at that salt setting. See Figure 2 for a graph of an example capacity run.



During capacity testing, the amount of residual chloride in the softened water is measured after regeneration. The net increase in chloride concentration from the softener may not exceed 100 mg/L. This indicates that the rinse is sufficient to rid the softened water of excess salt.

A separate test known as 'softening performance' is required. This test involves regeneration of the softener at the lowest salt setting and operation at the manufacturer's rated service flow. Samples of product water are taken each minute for 10 minutes and the hardness of the water may not exceed one grain per gallon for any of these samples.

Because the brine system is not used when conducting capacity testing, accuracy of the brine system must be determined through a separate test. This testing is conducted at the lowest and highest salt settings and the setting closest to the midpoint of the range. It involves weighing the brine tank before and after regenerations and three successive runs within 15 percent of the nominal salt setting must be achieved.

For example, a 10-pound salt setting successful brine accuracy test would require the weight of the brine tank to decrease by 8.5 to 11.5 pounds after each regeneration, for a series of three regenerations. There is an alternate procedure that may be used for time-controlled brine systems, involving calculations based on saturated brine.

Figure 2. Typical capacity test

Softener efficiency

In this day and age of potential bans on water softeners due to concerns about salinity, efficiency is a very hot topic. Although efficiency is not required for certification to *Standard 44*, it may be required by state or local regulations.

This is true especially in western states like California that have water salinity problems. And states that currently do not have efficiency requirements for softeners may be moving in that direction.

Efficiency is based on the amount of hardness capacity per amount of regenerant salt and per volume of regenerant water. Efficient softeners require less salt and/or regenerant water to achieve the same amount of softening capacity as less efficient softeners. This results in less water consumption and less salinity added to the environment.

The efficiency of softeners varies with the amount of salt used for regeneration. The higher the salt dosage, the lower the salt efficiency. There are diminishing returns in terms of softening capacity for regenerating with more and more salt. In fact, there is a point at which additional salt used in regeneration will not achieve any more softening

capacity and will simply be rinsed out of the system.

Efficiency is calculated from data measured and recorded during capacity testing. The requirements for efficiency are included in Figure 3. Only demand initiated regeneration (DIR) softeners may claim efficiency. A softener must achieve both salt efficiency and water efficiency in order to be 'efficiency rated.'

Figure 3. NSF/ANSI 44 efficiency requirements for DIR softeners only

Parameter	Efficiency requirement
Salt efficiency	At least 3,350 grains of capacity per pound of regenerant salt
Water efficiency	At least 1,000 grains of capacity per five gallons of regeneration water

Also any efficiency specifications or statements must refer to the salt setting at which the efficiency was achieved. The State of California has a more stringent requirement for salt efficiency ratings than does *Standard 44*, requiring at least 4,000 grains of capacity per pound of regenerant salt.

Conformance by calculation—certification of families of softeners

Standard 44 includes procedures to calculate pressure drop, capacity and efficiency for softeners that are similar to the test unit. There are specific requirements for softeners to be considered 'similar,' including:

- same control valve
- same distributor (length of distributor tube can vary with size of resin tank)
- limitations on variation in cation exchange resin specifications
- limitations on amounts of resin
- limitations on resin tank size
- limitations on regeneration volumes
- limitations on flow rates
- limitations on salt dosages

The concept is that a line of softeners built with the same control valve can be certified based on testing one or a few of them and then using calculations included in the standard to calculate pressure drop, capacity and efficiency for the non-tested models. The limitations are designed to keep only softeners that function similarly in the same family.

The equations used for calculations have proven accurate in practice. Conformance by calculation allows manufacturers to certify broad lines without unnecessarily testing each one of many very similar softeners.

A comprehensive standard

As you can see from this brief overview, *Standard 44* requires testing all relevant aspects of water softeners, from material safety to accuracy of the brine system. This means that a number of tests are required, each one designed to evaluate different aspects.

This is in contrast to *Standard 61*, which requires an evaluation for material safety only. Although POE softeners may be evaluated under and certified to either one, the comprehensiveness of *Standard 44* makes it the clear choice.

About the author

Rick Andrew is the Operations Manager of the NSF Drinking Water Treatment Units Program for certification of POE and POU systems and components. Prior to joining NSF, his previous experience was in the area of analytical and environmental chemistry consulting. Andrew has a Bachelor's Degree in chemistry and an MBA from the University of Michigan. He can be reached by phone at 1-800-NSF-MARK or by email at Andrew@nsf.org.

DOWEX™ HCR-S

A High Capacity Cation Exchange Resin for Softening and Demineralization Applications

Product	Type	Matrix	Functional group
DOWEX™ HCR-S	Strong acid cation	Styrene-DVB gel	Sulfonic acid

Guaranteed Sales Specifications		Na^+ form	H^+ form
Total exchange capacity, min.	eq/L	2.0	1.8
	kgr/ft³ as $CaCO_3$	43.7	39.3
Bead size distribution range† 300 - 1,200 µm, min. (50 mesh - 16 mesh)	%	90	90
Acidity range	pH	7.0 - 10.5	—
Color throw, as packaged, max.	APHA	20	—

Typical Physical and Chemical Properties		Na^+ form	H^+ form
Water content	%	44 - 48	50 - 56
Whole uncracked beads	%	90 - 100	90 - 100
Total swelling ($Na^+ \rightarrow H^+$)	%	8	8
Particle density	g/mL	1.28	1.22
Shipping weight	g/L	820	780
	lbs/ft³	51	49

Recommended Operating Conditions

- Maximum operating temperature: 120°C (250°F)
- pH range 0 - 14
- Bed depth, min. 800 mm (2.6 ft)
- Flow rates:
  - Service/fast rinse 5-50 m/h (2-20 gpm/ft²)
  - Backwash See figure 1
  - Co-current regeneration/displacement rinse 1-10 m/h (0.4-4 gpm /ft²)
- Total rinse requirement 3 - 6 Bed volumes
- Regenerant: 1-8% H_2SO_4, 4-8% HCl or 8-12% NaCl

† For additional particle size information, please refer to Particle Size Distribution Cross Reference Chart (Form No. 177-01775).

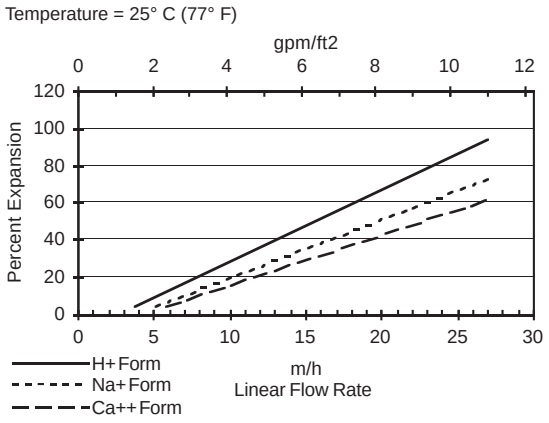
Typical Properties and Applications



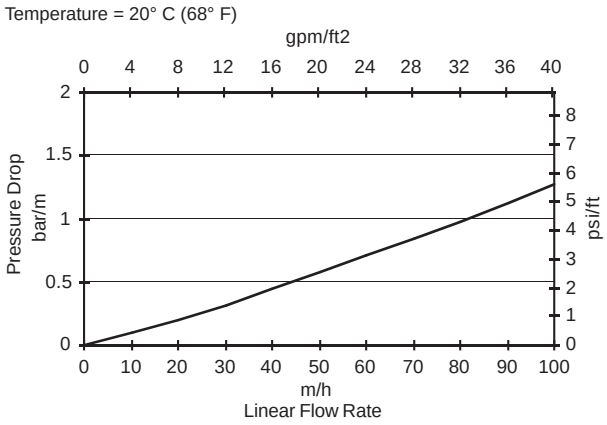
DOWEX™ HCR-S cation exchange resin is a high capacity resin with excellent kinetics and good physical, chemical and thermal stability.

DOWEX HCR-S cation exchange resin is well suited for industrial water softening and demineralization in the co-current mode of regeneration.

Packaging

25 liter bags or 5 cubic feet fiber drums

Figure 1. Backwash Expansion Data



For other temperatures use:

$F_T = F_{77°F}$ [1+ 0.008 ($T_{°F}$ -77)], where F ≡ gpm/ft^2

$F_T = F_{25°C}$ [1+ 0.008 (1.8$T_{°C}$ - 45)], where F ≡ m/h

Figure 2. Pressure Drop Data

For other temperatures use:

$P_T = P_{20°C}$ / (0.026 $T_{°C}$ + 0.48), where P ≡ bar/m

$P_T = P_{68°F}$ / (0.014 $T_{°F}$ + 0.05), where P ≡ psi/ft

Note: These resins may be subject to drinking water application restrictions in some countries: please check the application status before use and sale.

Warning: Oxidizing agents such as nitric acid attack organic ion exchange resins under certain conditions. This could lead to anything from slight resin degradation to a violent exothermic reaction (explosion). Before using strong oxidizing agents, consult sources knowledgeable in handling such materials.

694 SERIES CHECK VALVE

694 Poppet Check Valve Design Considerations

The 687 Series Poppet Check Valve incorporates a thin elastomer disc supported by a poppet that seals on the seat. Pressure in the flow direction moves the seal off the seat first before pressure builds enough to move the poppet away from the seat. The 687 Series Check Valve maximum operating pressure of 125 psi covers a wide range of air and fluid applications. The 687 Check is a compact design with a light cracking pressure, high flow rate, and a positive seal at very low back pressure or slight vacuum. For higher cracking pressure applications, an embedded o-ring poppet is substituted for the standard elastomer disc poppet.

Example:

Body Material	Inlet End	Outlet End	Seal	Spring
White Filled Poly	1/4 FNPT	1/4 FNPT	Viton®	1 psi, O-ring

SMC Part Number: WFP CHK 694-4F4F-F,1# O-Ring

The flow arrow on the body will point from Inlet to Outlet. SMC Part Numbers are a description of the valve as read left to right, Inlet to Outlet.
Example: WFP CHK 694-4F4F-F,1# O-Ring = 1/4 FNPT Inlet x 1/4 FNPT Outlet

694 Series Options

Material Options	Black Polypropylene Body & Poppet White Polypropylene Body & Poppet
Seal Options	Buna-N, Ethylene Propylene, Fluoroelastomer (Viton®)
End Options	1/4 Female NPT X 1/4 Female NPT
Cracking Pressure	302 Stainless Spring - 1/3 psi (Standard), 1, 7 psi

SMC will quote alternate materials or customize our standard products when quantities ensure competitive pricing.

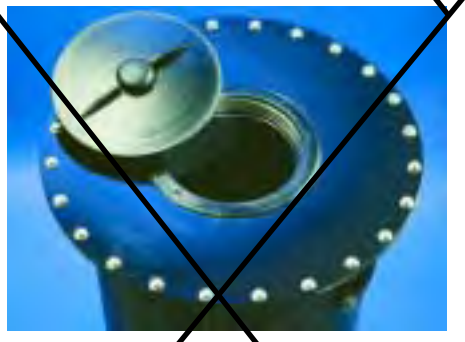
ECONOMY MOLDED PLASTIC TANKS

CYLINDRICAL TANKS, HEAVY-DUTY, CALIBRATED



NOTE: The tank weights and wall thicknesses listed in this section are approximate.

HINGED INSIDE COVER

- Made from Polypropylene sheet.
- Fits into top rim flange.
- Flexible long Polyolefin hinge.
- Provides 50% access when open (standard).
- Custom designs available.

FLAT BOLTED COVER

- 304 SS bolts, nuts, and washer.
- Vinyl gasket.
- Three bead welded joints.
- Flat Polypropylene sheet.
- Shown with optional threaded access port.

770.110.120 Covers

FEATURES

- Every tank on this page has rigid, extra-heavy walls to assure maximum strength and durability under severe conditions, making them ideal for a wide variety of applications. They can safely handle a variety of corrosive liquids. The visible liquid level and calibration in gallons allows for convenient reading of contents. The rim flange provides extra strength and ease of handling. The tanks are leak-proof and the one-piece construction eliminates seams, joints and welds, and cleaning is accomplished quickly and easily.

CYLINDRICAL TANKS, LINEAR POLYETHYLENE

- These rigid, self-supporting tanks have excellent resistance to chemicals, impact and abrasion. They withstand continuous operating temperatures up to 180˚F; intermittent service to 212˚F.

INDUSTRIAL
WATER PROCESSING SYSTEMS

CENTRAL BRINE DRUM
INSTALLATION INSTRUCTIONS

Manufactured by:
Kinetico Incorporated
Newbury, OH 44065
440.564.9111

The pioneer in non-electric water processing systems.

CAUTION

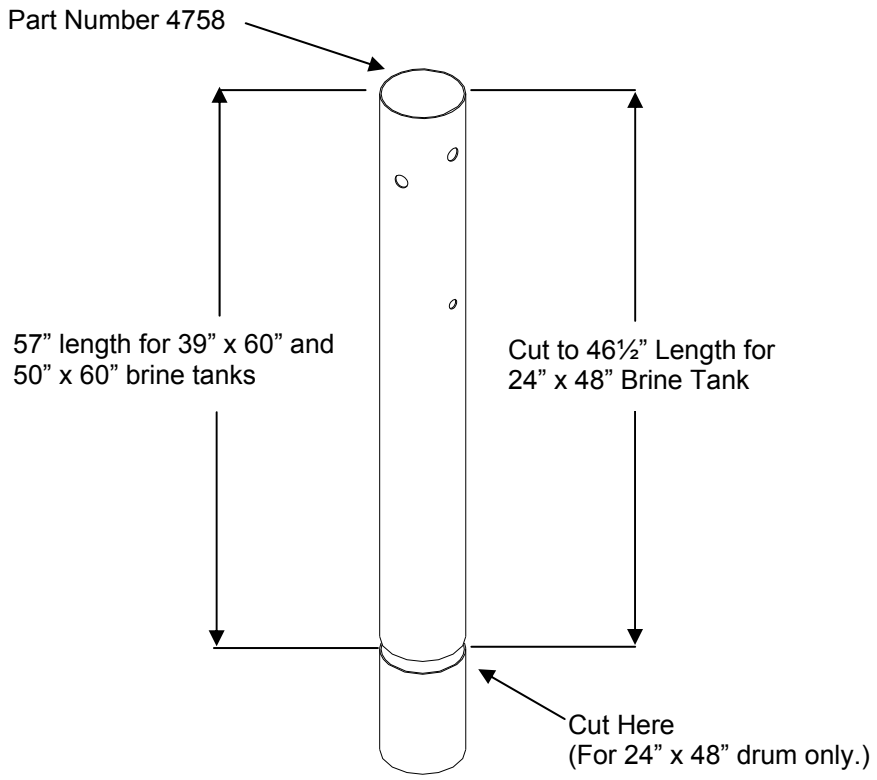
The central brine refill valve (part number 4967) has a maximum operating pressure of 80 psi (5.5 bar). If the system pressure exceeds 80 psi (5.5 bar), a pressure regulator must be installed on the central brine drum's refill line. Failure to do so will result in erratic brine valve operation, which can result in brine tank overflow, hardness breakthrough, and other issues.

Step 1 – Check contents. Before you begin the assembly, inventory all parts to be sure nothing is missing

Brine Drum	
#4724	24 x 48 w/Lid
#4726	39 x 60 w/Lid
#4728	50 x 60 w/Lid

Internals Assembly		
Part No.	**Description**	**Qty.**
1138	Elbow, Overflow	1
1139	Nut, Overflow	1
1869	C/B Screw, 10/32" x ½"	10
1870	C/B 3/8" PVC Coupling	1
2360	C/B Brass Collar	2
2361	C/B Brass Rod, 3'	1
2944A	C/B Bulkhead with Distributor	1
57054	C/B Bulkhead Fitting, ¾"	1
4967	C/B Brine Refill Valve, ¼"	1
3406	C/B Plastic Nipple	1
3407	C/B Plastic Elbow	1
3408	C/B Adapter, Float Rod	1
3430	C/B Brass Nut, 10/32"	10
3431	C/B Clamp, 3/8"	10
3793	C/B Cover, Brine Well	1
4731	C/B Float Ball 4½"	1
4756	C/B Tubing, 13' x 3/8" Drilled	1
4758	C/B Brine Well 5" x 57" Drilled	1
4759	C/B Plug ¾" JACO	1
4761	C/B Spray Tubing End Fitting	2
4762	C/B Plug ¼" JACO	1

Brine Drum	
#7737	22 x 36 w/Lid



Internals Assembly		
Part No.	**Description**	**Qty.**
7739	C/B Brass Rod 31" (22 x 36 only)	1
7740	C/B Brine Well 5" (22 x 36 only)	1

Step 2 – Cut brine well. If you are using 24" x 48" brine tank (part number 4724), you must shorten the brine well (part number 4758).

The brine well has a standard length of 57". For use with the brine tank (part number 4724), this length must be reduced to 46½".

Well is to be shortened on the opposite end of holes when necessary. Refer to Figure 1.

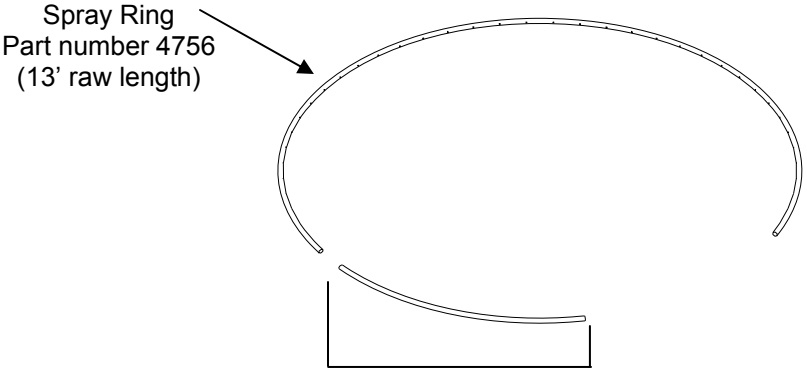


Figure 1

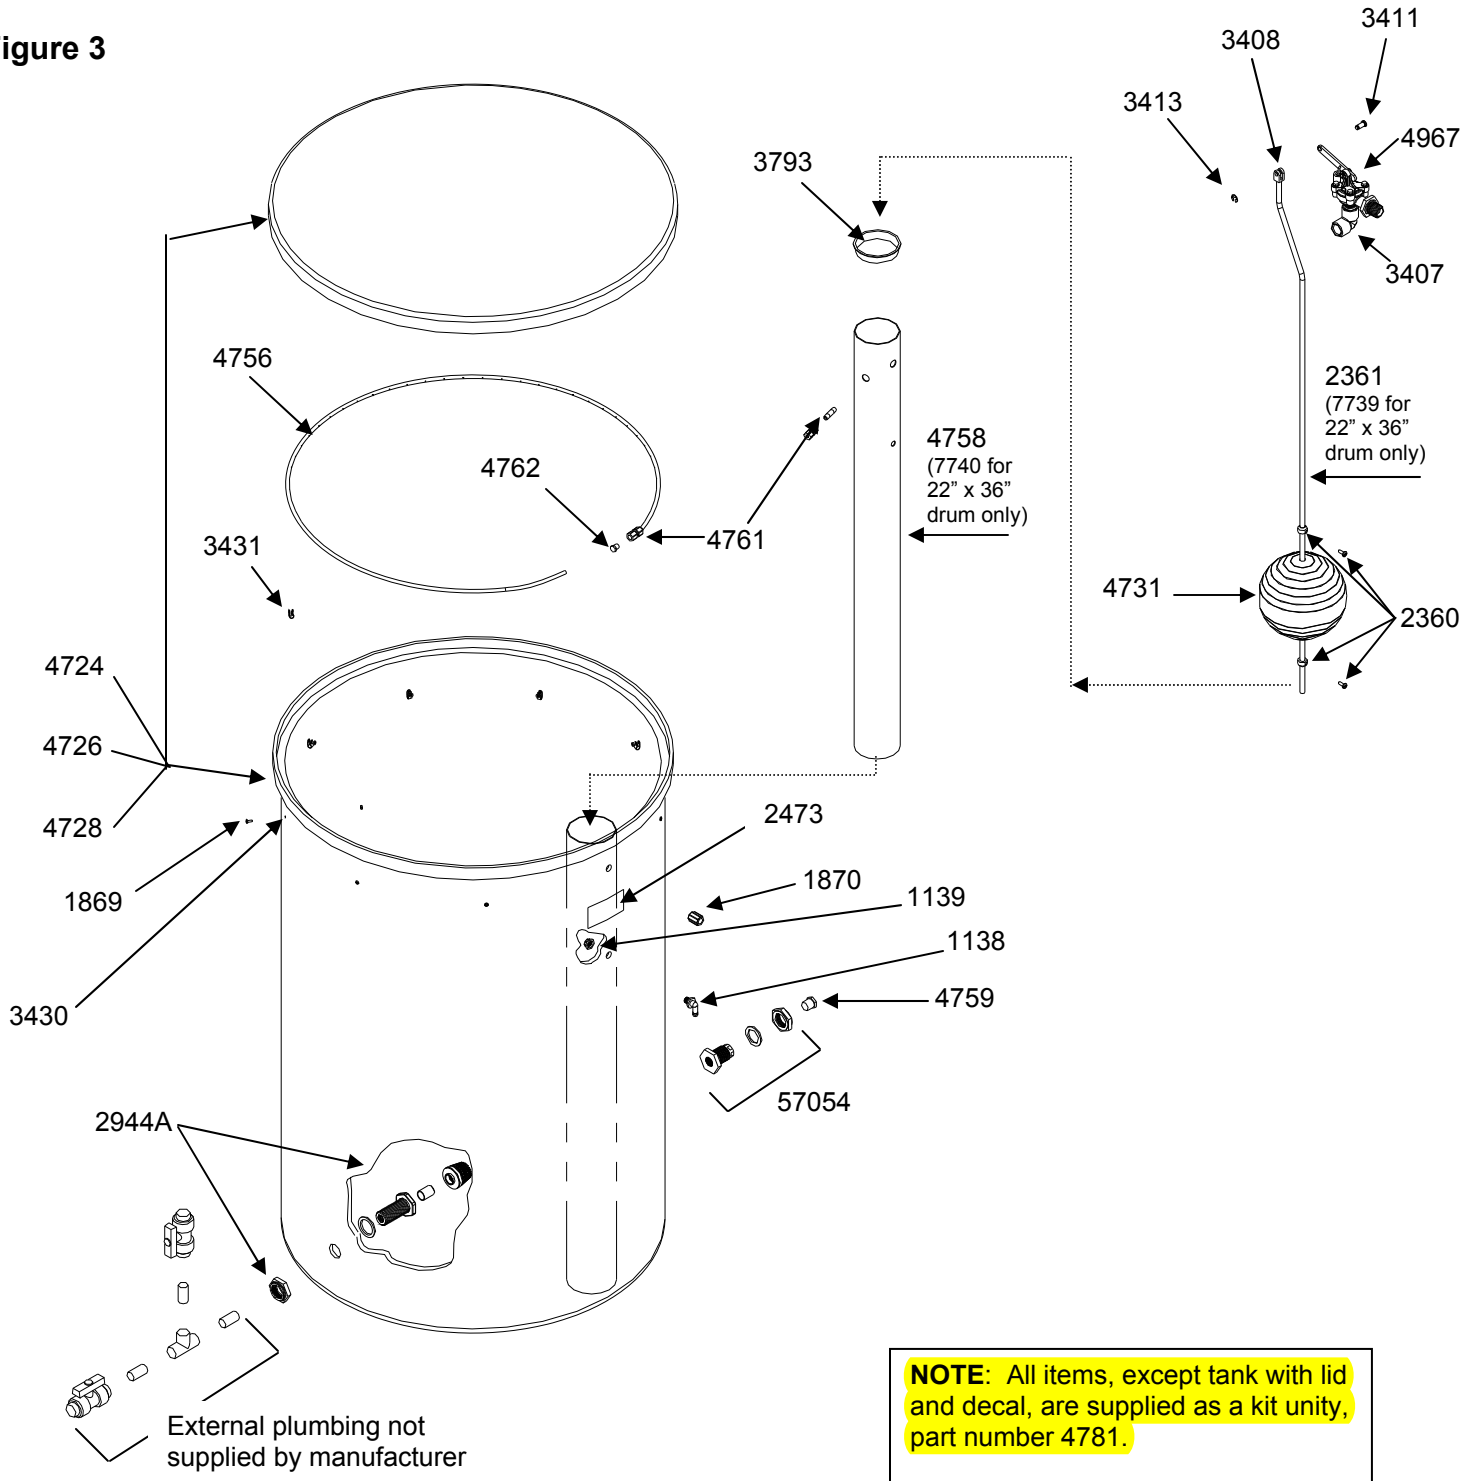
Step 3 – Cut the spray ring to proper length. See table below.

Brine Tank Size	Part Number	Spray Ring Length
22” Dia. x 36” H	7737	60” – 5’
24” Dia. x 48” H	4724	66” = 5’ 6”
39” Dia. x 60” H	4726	114” = 9’ 6”
50” Dia. x Height	4728	153” = 12’ 9”

Figure 2

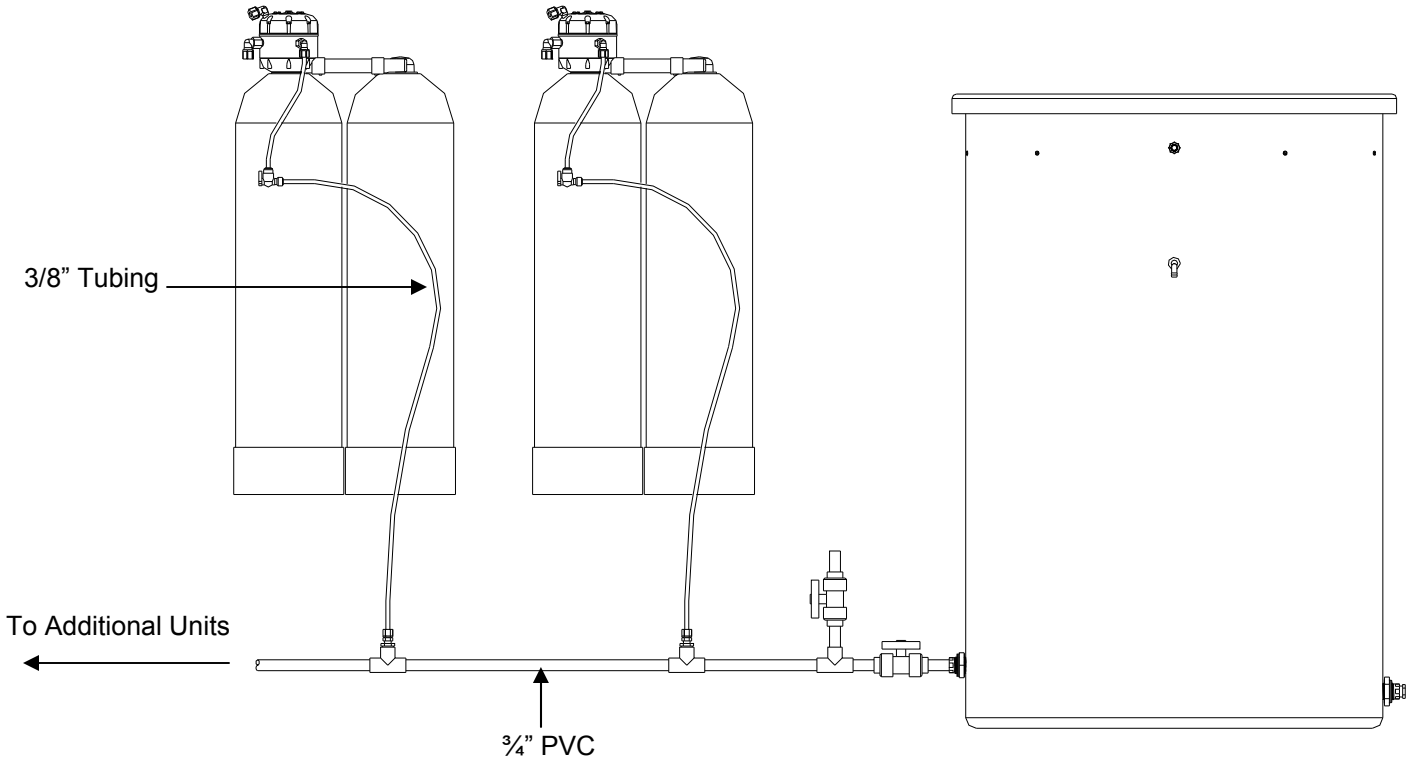


See chart above for length of spray ring to be cut from the 13 foot raw length.

Step 4 – Assemble the internals package and attach it into the brine drum as shown in Figure 3. Use detailed instruction sheet if required (Step 8).

NOTE: Be sure to place part number 57054 in the bottom hole on the brine tank. This is used for clean out purposes, so install plug (part number 4759), or add a shut-off valve. Part number 2944A should be inserted into the opening that is located 6” from the floor. This is the brine feed to the softeners. For 22” x 36” drum, install part number 2944A in either hole.

Figure 3

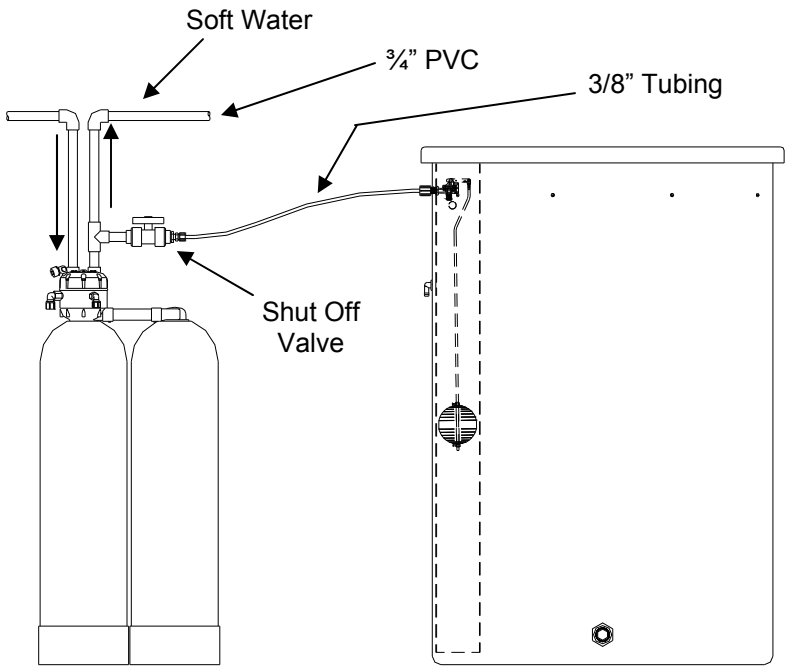


NOTE: All items, except tank with lid and decal, are supplied as a kit unity, part number 4781.

Use kit, part number 7742, when installing the 22 x 36 drum.

Step 5 – Brine Distribution Piping – The distribution piping from the brine tank to the brine check valve is not included with this system (refer to Figure 4). This represents our recommended layout for this piping.

Figure 4



Step 6 – Inlet Connection – When the brine discharge piping is complete, install a feed line to the brine spray valve. This feed line should connect to a soft water line. Refer to water softener instruction.

The inlet tubing and fittings are not part of the system. This represents our recommended layout for the system

Use flexible 3/8" tubing. Be sure to install a shut-off valve. Refer to Figure 5.

Figure 5

Step 7 – Start-up

1. Open inlet valve slowly.
2. Check spray valve for correct operation.
3. Let water level cover brine discharge fitting.
4. Shut off water.
5. Check brine discharge fitting for leaks.
6. Check clean-out fitting for leaks.
7. Add sale to spray ring opening.
8. Open inlet valve.

9. Water level should shut off approximately 24” down the brine well.

Step 8 – Detailed Assembly Instructions for Brine Drum Assembly

NOTE: Use teflon tape for all threaded pipe connections.

A. For 39” and 50” Diameter Drums

1. Assemble bulkhead fittings to brine drum as shown, with the rubber washer on the inside. Be sure the washer does not squeeze out while tightening.
2. Mount the brine well (part number 4758) to the drum using overflow fitting (part number 1138) and nut (part number 1139).
3. Assemble 90° elbow (part number 3407) and nipple (part number 3406) to refill valve (part number 4967)
4. Install top collar (part number 2360) on bent float rod and position it 14” from straight end and secure. Slide ball on rod. Position lower collar (part number 2360) on rod and secure it approximately 2” from end of rod. Top collar for 22” x 36” should be installed 9” from end of rod.
5. Screw float to valve adapter fitting (part number 3408) to float rod. DO NOT OVERTIGHTEN.
6. Using pin (part number 3411) and E-ring (part number 3413), attach rod and float assembly to valve (part number 4967) activator arm.
7. Lower float rod and valve assembly into brine well. Moiunt valve to tank through hole in brine well.
8. Assemble tube to nipple fitting (part number 4761) to nipple (part number 3406) through hole in the brine wall.
9. Connect spray tube (part number 3431) to fitting (part number 4761) leading to valve and add end plug fitting to spray tube. Plug fitting consists of hose to female thread fitting (part number 4761) and ¼” pipe plug (part number 4762).
10. Using the 8 hangers (part number 3431), screws (part number 1869) and nuts (part number 3430), mount spray tube to drum using holes provided. Spray holes should be angled down toward salt.

B. For 24” Drum

The procedures are identical to those listed, except the shorter 46½” brine well is used. Also, only 6 hangers are needed to mount the spray tube (part number 4756).

C. For 22” Drum

Same as above. Only difference is a different brine well is used (part number 7740).

THIS PAGE LEFT BLANK INTENTIONALLY

PVC & CPVC COMPACT 2000 BALL VALVES

CB2000-2-0604

Industrial Grade, Maintenance-Free Sealed Unit
New Lower-Profile, More Compact Design
Provides Even Greater Space-Savings

- New Actuation-Ready Body – Accepts Spears® Improved Mini-Mount Actuator Mounting Kits
- New Double O-ring Stem Seal
- Spears® Safe-T-Shear Stem
- PTFE Self Adjusting Floating Seats
- EPDM or Viton® O-ring Seals
- Full 235 psi Pressure Rating @ 73°F
- NSF Certified for Use with Potable Water
- Suitable for Vacuum Service
- Produced in ASTM IPS sizes 1/2" - 2" with Socket or Threaded End Connectors

Corrosion Resistant PVC or CPVC Construction, Silicone Free Assembly

Spears® Compact 2000 Ball Valves never rust, scale, or pit, providing exceptional chemical and corrosion resistance. Assembled with water soluble, silicone free lubricant.

Actuation-Ready Body Mounting Lugs

Valve body has built-in mounting lugs for direct attachment to Spears® improved Mini-Mount actuator mounting kits.

PTFE Ball Seats

Spears® PTFE floating seat design reduces seat wear for extended valve life, smooth operation, and bubble-tight shutoff. 100% factory tested.

EPDM or Viton® O-ring Options

Available with high grade, abrasion resistant EPDM or Viton® elastomer O-ring seals. Allows application specific selection for optimum chemical resistance.

High Impact Polypropylene Handle

Low profile, double stop design. Exhibits excellent resistance to most chemical environments.

Sample Engineering Specification

All thermoplastic ball valves shall be Compact 2000 sealed unit type manufactured to ASTM F 1970 and constructed from PVC Type I, ASTM D 1784 Cell Classification 12454 or CPVC Type IV, Cell Classification 23447. All Valve bodies shall have actuation mounting lugs. All O-rings shall be EPDM or Viton®. All valves shall have Safe-T-Shear® stem with O-ring stem seal and double-stop Polypropylene handle. All valves shall be listed by NSF International for use in potable water service. All 1/2" - 2" valves shall be pressure rated at 235psi, for water at 73°F, as manufactured by Spears® Manufacturing Company.

Full Schedule 80 Bore

In open position, full-bore provides optimum flow with pressure drop equal to that of an equivalent length of Schedule 80 pipe.

Suitable for Vacuum Service

Compact 2000 Ball Valves have been tested at 26 in-Hg. vacuum for one hour with less than 1-in. Hg loss.

NSF Certified for Potable Water

All Compact 2000 Ball Valves are NSF Certified for use in potable water systems.

Optional Accessories

- Round Safety Handle
- Stem Extension Kit
- Mini-Mount Actuation Mounting Kit (AMB3 Series)
- 2" Square/T-Style Operator Nut

NOT FOR USE WITH COMPRESSED AIR OR GASES

Spears® Manufacturing Company DOES NOT RECOMMEND the use of thermoplastic piping products for systems to transport or store compressed air or gases, or the testing of thermoplastic piping systems with compressed air or gases in above and below ground locations. The use of our product in compressed air or gas systems automatically voids any warranty for such products, and its use against our recommendation is entirely the responsibility and liability of the installer.

WARNING: DO NOT USE COMPRESSED AIR OR GAS TO TEST ANY PVC OR CPVC THERMOPLASTIC PIPING PRODUCT OR SYSTEM, AND DO NOT USE DEVICES PROPELLED BY COMPRESSED AIR OR GAS TO CLEAR SYSTEMS. THESE PRACTICES MAY RESULT IN EXPLOSIVE FRAGMENTATION OF SYSTEM PIPING COMPONENTS CAUSING SERIOUS OR FATAL BODILY INJURY.

Prices subject to change without notice. Possession of this price schedule shall not be construed as an offer to sell the products listed. Product drawing(s) and/or photograph(s) are representative and may not fully reflect product configuration.

PVC & CPVC UTILITY BALL VALVES

UT-2-1101

Economy, Utility and Quality

A high quality, economical, quarter-turn shut off valve designed for irrigation, pool and spa applications. Available in IPS sizes 1/2" through 4", with choice of either socket or threaded end connectors, plus 6" socket.

PVC or CPVC Construction
Excellent companion for PVC systems such as lawn sprinklers, pools, spas, water gardens and other light-duty applications.

One-Piece Sealed Unit
Never requires adjustment.

Teflon® Ball Seats
Smooth operating PTFE floating seat design reduces wear.

EPDM O-ring Seals
High grade, abrasion resistant EPDM elastomer O-rings.

Full Schedule 80 Bore
In full open position, full bore virtually eliminates pressure drop, providing optimum flow.

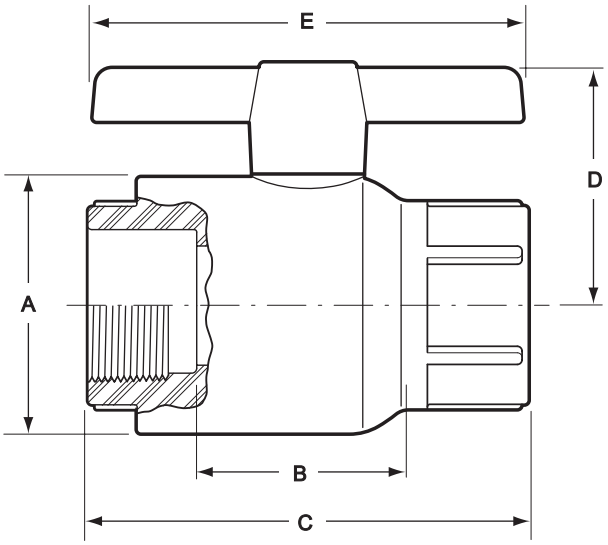
High Impact Polypropylene Handle
Features double-stop engagement.

Safe-T-Shear® Stem
Developed to help prevent line fluids from leaking out in the event of ball valve stem damage. Engineered for high strength, the stem incorporates a special shear point to control accidental breakage. Over-torquing breaks occur above the stem O-ring leaving the seal intact until replacement can be made.

150 psi Pressure Rating
Maximum Internal Pressure at 73°F for a variety of applications.

Certified by NSF for Potable Water
All Utility Ball Valves are Certified by NSF International for potable water use.

For additional information, please refer to Spears® THERMOPLASTIC VALVES & ACCESSORIES PRODUCT GUIDE & ENGINEERING SPECIFICATIONS, V-4 and THERMOPLASTIC VALVES & ACCESSORIES Price Schedule V-1.



Sample Engineering Specifications
All thermoplastic ball valves shall be Utility sealed unit type constructed from PVC Type I Cell Classification 12454 or CPVC Type IV Cell Classification 23447. All O-rings shall be EPDM. All valves shall have Safe-T-Shear® stem and double stop Polypropylene handle. All valves shall be listed by NSF for use in potable water service. All valves shall be pressure rated at 150 psi for water at 73°F, as manufactured by Spears® Manufacturing Company.

CAUTION

- NO SMOKING, OPEN FLAMES, OR ANY OTHER IGNITION SOURCES IN THE VICINITY OF THIS TANK OR VENT
- PERMIT REQUIRED CONFINED SPACE, USE CONFINED SPACE PROCEDURES PER OSHA STANDARD 1910.146
- DO NOT ADD OTHER CHEMICALS TO THE TANK OR VENT
- REFER TO MIOX OPERATOR'S MANUAL FOR OTHER SAFETY RELATED PRECAUTIONS

This Tank or Vent May Contain	**Statement of Hazards**
• Hydrogen Gas with a Hazard Rating Identification of (0-4-0-Null)	• Flammable Gas present • Fire & Explosion Hazard present • Simple Asphyxiate Gas present
• Dilute (<1% by volume) Sodium Hypochlorite Solution with a Hazard Rating Identification of (2-0-1-Null)	• Moderate Health Hazard present • Incompatible and/or hazardous reactions can occur with addition of other chemicals, such as strong acids, strong reducing agents, amines, ammonium salts, metals, methanol, phenylacetonitrile, formic acid, and ammonia

Miscellaneous Storage Tanks

Industrial Mini Bulk (IMB) and Industrial Mini Drum tanks (IMD) are molded in either high density crosslink polyethylene or NSF Certified linear polyethylene. Molded polyethylene skids are optional for both IMB 120 and 200 models. These skids allow the tank to be lifted and re-located during non-use periods. The IMD series tanks have molded in baffles and forklift access.

Model Number	Capacity (US Gallons)	Dimensions (inches)		Weight (lbs) 1.9 Sp. Gravity		Access Opening (inches)
		Diameter	Height	Linear Polyethylene	Crosslinked Polyethylene	
IMB 120	120	40	30	40	40	6
IMB 200	200	40	44	50	50	6
IMB-Pallet	--	--	4	40	40	--
IMD 110	110	37	32	35	35	6
IMD 175	175	37	45	50	50	6

Open Top Tanks

Industrial Open Top tanks (IOT) are molded from your choice of virgin high density cross-link or NSF certified linear polyethylene. These flat bottom vertical tanks are molded with a stiffening lip on the top to give the tank rigidity, and they are equipped with shoe-box style cover. Assmann open top tank covers have a unique design that allows the lid to be hinged and stay open. Available in a variety of colors and in sizes ranging from 30 to 680 gallons. As an option for these tanks, Assmann offers both stainless steel and mild steel epoxy coated agitator support stands.

Double Wall Base Containers

Rectangular, low profile, chemical storage tank for various material handling applications. Features a primary tank that holds 450 US gallons, allowing intermediate bulk containers (IBC) to be quickly emptied and back on the road. Constructed from crosslink polyethylene or FDA approved and NSF Certified linear polyethylene.

Model Number	Capacity (US Gallons)	Dimensions (inches)			Weight (lbs) Linear and Crosslinked Polyethylene		Access Opening (inches)
		Width	Length	Height	1.9 Sp. G	2.2 Sp. G

Model number availability and individual specifications subject to change without notice.
Gallonage and weights are approximate.

PVC & CPVC TRUE UNION 2000 VALVES

TU2000-2-0605

One of the Most Versatile, Compact Valve Designs Available

Spears® True Union 2000 Ball Valves, 3-Way Ball Valves and Ball Check Valves provide maximum versatility with fully interchangeable valve cartridges. Provides for easier system design modifications and upgrades in multiphase projects, or anywhere changes in valve types are desired. Simply exchange any True Union 2000 valve in-line using existing union nuts. Also mates with Spears® new Schedule 80 Unions and Diaphragm Valves. All True Union 2000 valves feature a low profile, compact design for minimal space requirements. Available in PVC or CPVC with choice of EPDM or Dupont Dow Genuine Viton® O-ring seals and socket, flanged, or optional Spears® patented Special Reinforced (SR) threaded end connectors. Additionally, Spears® offers valve Retrofit Kits for easy in-line replacement of other valves and factory installed Actuation Packages. Assembled with silicone-free lubricant.

True Union 2000 Industrial Ball Valve

- Multi-featured Industrial Grade
- Built-in Handle Lockout
- Fully Serviceable, Replaceable Components
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- ISO Pattern Actuation Mounting Option
- Spears® Dual O-ring Safe-T-Shear® Stem
- Self Adjusting PTFE Floating Seat Design
- Sizes 1/2” - 2” pressure rated to 235 psi @ 73°F, sizes 2-1/2” - 6” and all flanged to 150 psi @ 73°F
- NSF Certified for Potable Water Use
- Also Available in **SPEARS® LXT™** High Purity, Low Extractable PVC Material
- Produced in IPS sizes 1/2” - 6” with Socket, Flanged or SR Threaded End Connectors

True Union 2000 Industrial 3-Way Valve

- Industrial Grade, Multiport, Diverter, L-Pattern & T-Pattern configurations Vertical 3-Way or Horizontal Diverter (shown)
- Built-in Handle Lockout
- Fully Serviceable, Replaceable Components
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- ISO Pattern Actuation Mounting Option
- Spears® Dual O-ring Safe-T-Shear® Stem
- Self Adjusting PTFE Floating Seat Design
- Sizes 1/2” - 2” pressure rated to 235 psi @ 73°F, sizes 2-1/2” - 4” and all flanged to 150 psi @ 73°F
- NSF Certified for Potable Water Use
- Produced in IPS sizes 1/2” - 4” with Socket, Flanged or SR Threaded End Connectors

True Union 2000 Industrial Ball Check Valve

- Industrial Grade
- Flow-Tested for Minimum Turbulence
- Fully Serviceable, Replaceable Components, uses Standard O-ring Seat
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- Easily Converted to Foot Valve
- NSF Certified for Potable Water Use
- Also Available in **SPEARS® LXT™** High Purity, Low Extractable PVC Material
- Sizes 1/2" - 2" pressure rated to 235 psi @ 73°F, sizes 2-1/2" - 6" and all flanged to 150 psi @ 73°F
- Produced in IPS sizes 1/2" - 6" with Socket, Flanged or optional SR Threaded End Connectors
- Also available in PVC White

Check Valve Size	1/2	3/4	1	1-1/4	1-1/2	2	2-1/2	3	4	6

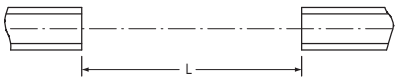
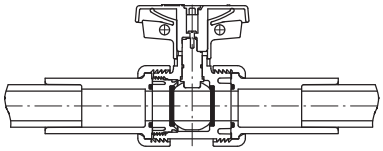
Economical True Union 2000 Standard Ball Valve

- High quality Standard Ball Valve
- Allows future system upgrade
- Excellent for OEM Applications
- Replaceable Seats
- Safe-T-Blocked® Seal Carrier - Full Rated Pressure
- Spears® Safe-T-Shear® Stem
- Self Adjusting Floating Seat
- Sizes 1/2" - 2" pressure rated to 235 psi @ 73°F, sizes 2-1/2" - 4" and all flanged to 150 psi @ 73°F
- NSF Certified for Potable Water Use
- Produced in IPS sizes 1/2" - 4" with Socket, Flanged or SR Threaded End Connectors
- Also available in PVC White



True Union 2000 Retrofit Valves or Kits



Easily converts any system over to all True Union 2000 style valves for consistent valve type and uniform maintenance. Special extended socket style End Connectors (2) allow retrofit replacement of other brand valves in existing piping systems with a new True Union 2000 valve. Simply cut out old valve according to specified dimension and install retrofit end connectors. End connectors are provided with either EPDM or genuine Viton® O-rings. Can be ordered as End Connector Kit or fully assembled Retrofit Valve.

3-Way Port Options

True Union 2000 Actuated Valves

Universal ISO Actuator Mounting Pattern Option

Spears® offers optional actuator mounting with standard ISO Mounting Pattern for user actuation of True Union 2000 Ball Valves.

Factory Actuated Valve Packages

Spears® Electric or Pneumatic Actuation Packages eliminate customer's having to determine proper valve and actuator mating. Pre-matched packages insure proper torque, coupling and mount for optimum performance - all factory installed and tested for proper alignment and operation. Actuation packages can be custom built to user specifications from Spears® wide selection of options, voltages and accessories. Contact Spears® for additional information.

Foot Valve Screens

- Easily converts Ball Check Valve to a Foot Valve.
- Standard IPS spigot connection fits slip-socket valve end connector.
- Enlarged screen provides open area equivalent to valve for optimum flow characteristics.
- Chemical and corrosion resistant PVC or CPVC construction.

Typical Application (VALVE NOT INCLUDED)

Split Nut Kit for True Union 2000 Valves & Union 2000 Schedule 80 Fittings

Split Nut Kits are designed to replace broken union nuts on Spears® True Union 2000 Ball Valves and Union 2000 Schedule 80 Unions. Kit includes SS316 Gear Clamp and 2-Split Nut halves. Can also be used if nut was not in place during end connector installation. Split Nut is fully serviceable to original valve pressure rating.

NOT FOR USE WITH COMPRESSED AIR OR GASES

Spears® Manufacturing Company DOES NOT RECOMMEND the use of thermoplastic products to transport or store compressed air or gas.

Viton® is a registered trademark of DuPont Dow Elastomers

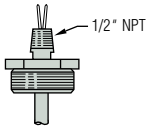
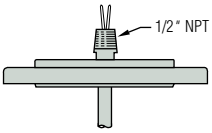
LS-800PVC Series – Our Most Economical Large Size Unit

- NSF Approved All-PVC Wetted Parts Available
- 1 to 7 Actuation Levels
- Lengths to 60 inches





Inexpensive, all-PVC LS-800PVC Series switches bring reliable level sensing to corrosive liquids. These durable, yet economical, switches use the same high-quality, dependable reed switches found in GEMS' most expensive models. NSF-approved wetted parts make the LS-800PVC suitable for potable water applications.

ALL CPVC Wetted Material

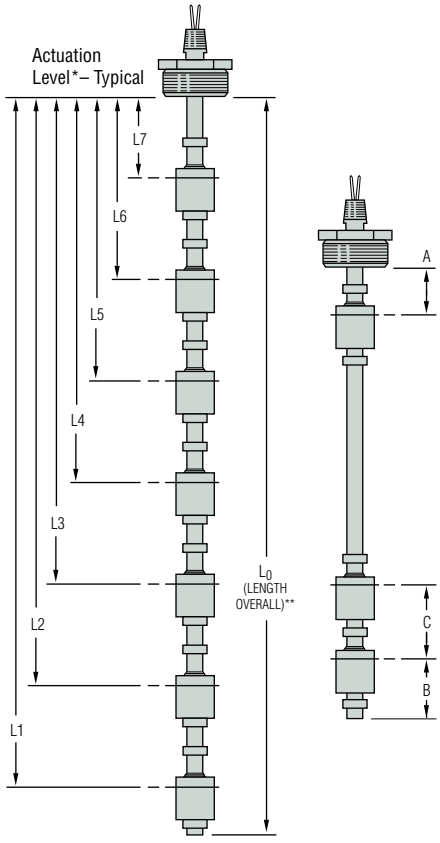
3. Number of Actuation Levels and Electrical Specifications

Typically, one float is required for each point at which you need a switch action to occur. The number of actuation levels available depends on type of wiring selected. See below.

Group I Wiring: 1 to 7 Actuation Levels
Group II Wiring: 1 to 4 Actuation Levels
Group III Wiring: 1 to 3 Actuation Levels
Group IV Wiring: 1 to 2 Actuation Levels
Switch (N.O. or N.C.):
SPST: 20 VA or 100 VA
SPDT: 20 VA
Lead Wires: #22 AWG, 24˝ L., PVC

Typical Wiring Diagrams
For clarity, only two actuation levels are shown in each group diagram.

GROUP I SPST | GROUP II SPST | GROUP III SPDT | GROUP IV SPDT



Wiring Color Code

SPST Switches				SPDT Switches 20 VA				
Wiring	**Group I**	**Group II**		**Group III**		**Group IV**		
Com. Wire	Black	None		Black		None		
	NO/NC	SW. Com.	NO/NC	NO	NC	SW. Com.	NO	NC
L1	Red	Red	Red	Red	Wh/Red	Red	Wh/Red	Wh/Blk/Red
L2	Yellow	Yellow	Yellow	Yellow	Wh/Yel	Yellow	Wh/Yel	Wh/Blk/Yel
L3	Blue	Blue	Blue	Blue	Wh/Blue			
L4	Brown	Brown	Brown					
L5	Orange							
L6	Gray							
L7	White							

Notes: See “Electrical Data” on Page X-5 for more information.

4. Actuation Level Dimensions

* Actuation level distances and L_0 (overall unit length) are measured from inner surfaces of mounting plug or flange.
** Length Overall (L_0) = L_1 + Dimension B. See Mounting Types for Maximum Length values.

Switch actuation levels are determined following the guidelines below.

A = 1-1/2˝ (38.1 mm) Minimum distance to highest actuation level.

B = 2˝ (50.8 mm) Minimum distance from end of unit to lowest actuation level.

C = 3˝ (76.2 mm) Minimum distance between actuation levels.

Notes:
1. Actuation levels are calibrated on descending fluid level, with water as the calibrating fluid, unless otherwise specified.
2. A and B dimensions based on a top mounted unit.
3. Float stops are permanently cemented in place.
4. Tolerance on actuation levels is ±1/8˝ (3.2 mm).
5. Dimensions based on a liquid specific gravity 1.0.

CL17 Chlorine Analyzer

Reliable, economical chlorine control

The Hach CL17 Chlorine Analyzer uses colorimetric DPD chemistry to continuously monitor water for free or total residual chlorine. This low-cost analyzer provides a dependable and economical alternative to instruments that rely on costly electrodes or complex procedures. Unaffected by even large swings of pH, the CL17 performs an analysis every 2.5 minutes, 24 hours a day.

The CL17 offers both an alarm for manual chlorine feed control and a 4-20 mA output for automatic control of chlorine feed pumps for drinking water, wastewater and other water applications. Set for manual control, the instrument notifies the operator of out-of-limit chlorine levels – and allows manual intervention in the disinfection process as needed. The CL17 can be set for automatic control of chlorine feed pumps using one of two methods:

1) *On-Off Control* – which turns the feed pumps on when chlorine levels fall too low for disinfection, off when levels rise above a pre-set limit;
2) *Proportional Control* – which controls the amount of chlorine in proportion to the strength of the CL17's output signal. This is done through the REC MIN and REC MAX keys. For automatic operation, the CL17 has one output control with a range of 4-20 mA, programmable over any portion of the instrument's 0-5 mg/L range.

The unit is housed in an ABS plastic case that is lightweight, shatterproof and corrosion-resistant. The case includes built-in mounting brackets that simplify installation. Two windows clearly show chlorine measurements, alarms and reagent levels. A hinged door allows quick access to internal components.

The CL17 is designed to operate continuously for up to 30 days without replacing reagents or cleaning the sample cell. Because of its low reagent use, low maintenance requirement and its ability to prevent overfeeding, the CL17 is exceptionally cost-efficient.

Applications – water, wastewater and more

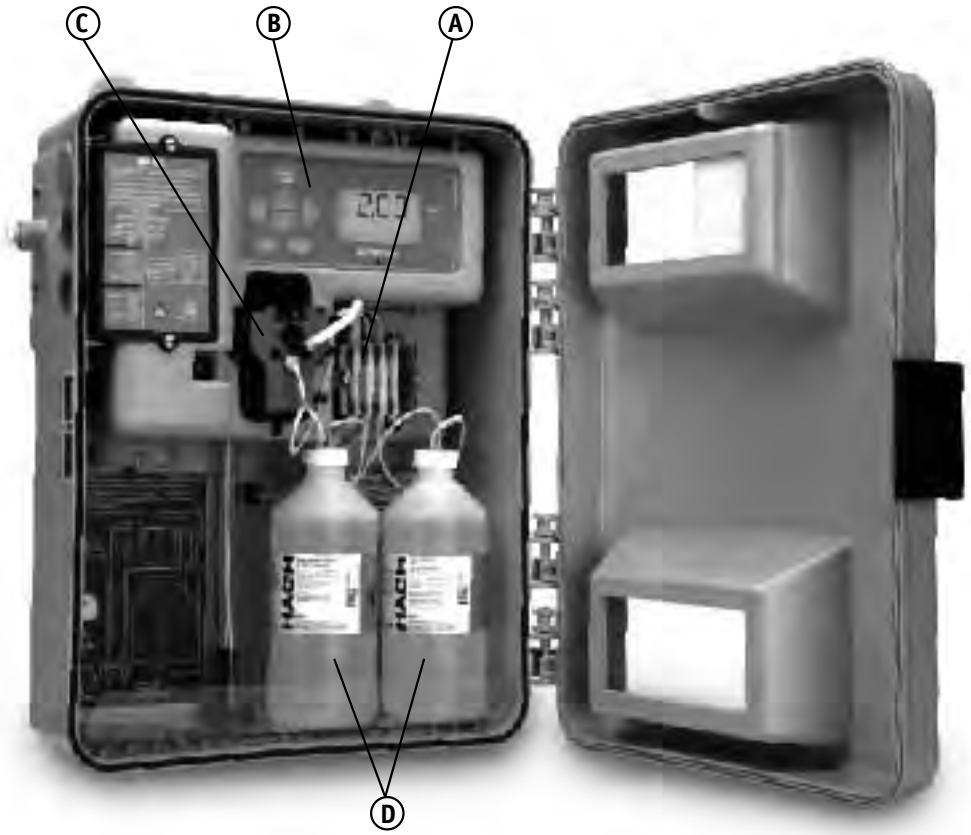
For drinking water applications, the CL17 can be used to monitor the raw water stage to facilitate preoxidation, disinfection and the control of taste and odor problems. It can also be used at the finished water stage, where residual chlorine levels must be maintained during the distribution phase. For wastewater applications, the CL17 has large tubing and fittings along with a Self-Cleaning By-Pass Y-Strainer Kit to ensure continuous operation without clogging.

Because it can be used to monitor disinfection – and help prevent biological build-up – the CL17 is also ideal for applications involving chemical or industrial process or feed water (e.g., textile and paper mills), heating and cooling water or food and beverage applications. In systems using reverse osmosis, the CL17 can help protect expensive cellulose acetate membranes through continuous monitoring of chlorine.

Fast, dependable operation

The CL17's internal pump, seal-free mixer and compact colorimeter combine to deliver reliable, low-maintenance operation – around the clock, seven days a week. The instrument's easy-to-clean sample cell and quick-access reagent chamber allow users to perform routine maintenance in 15 minutes or less per month (difficult samples may require more frequent cleaning). The CL17 is equipped with self-testing diagnostics and alarms that activate in the event of system problems or shut-down.

The Hach CL17 Chlorine Analyzer



- Colorimetric DPD chemistry – fast, reliable, economical
- Unattended operation up to 30 days
- Manual *or* automatic feed pump control
- Large tubing, strainer ideal for wastewater applications
- Low operating cost – no electrodes, minimal reagents, no risk of overfeeding

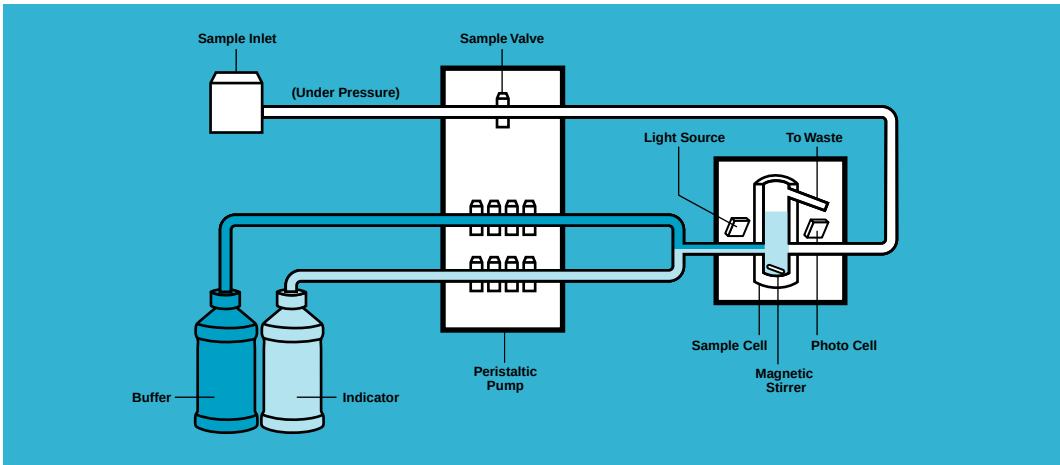
THERE'S ONLY ONE WAY TO BE SURE

Principle of operation

The CL17 Chlorine Analyzer consists of five main components – a linear peristaltic pump (A); a menu-driven LCD display that presents easy-to-read, scrolling messages explaining system status and operation (B); a colorimeter with a seal-free, solid-state mixing system* that includes a self-cleaning stir bar (C); and a one-month supply of reagents (D); all housed in a corrosion-resistant ABS, IP62 plastic case.

**Patent pending.*

Programming, set-up and manual diagnostics are simple with the CL17's keypad menu options. With a programmable 4-20 mA output, recorder options include the flexibility to set the limits to be output to a variety of devices such as a chart recorder, PLC or SCADA.



For further flexibility in data output, the CL17 is also available in an AquaTrend Network-ready configuration. (See How To Order for details.)

The linear peristaltic pump precisely controls the volume of incoming samples and reagents. The first sample is used to establish a zero reference point by measuring blank absorbance – compensating for the sample's color intensity and turbidity before the chlorine measurement is taken. Indicator and buffer reagents are added, a magnetic stirrer mixes the solution, and color development takes place. A compact colorimeter measures the light transmitted through the sample and compares the resulting color intensity to a reference standard.

The sample cell is then flushed with new sample, allowing the cycle to repeat itself every 2.5 minutes. An LED alarm can signal an out-of-limit sample concentration. The CL17's output can also be used to trigger external chlorine feed pumps, which automatically adjust chlorine injected into the system.

Method of analysis

The CL17 Chlorine Analyzer uses an aqueous buffered colorimetric indicator – N,N-diethyl-*p*-phenylenediamine (DPD) – to determine levels of chlorine. DPD turns a magenta color in response to the amount of free residual chlorine (as hypochlorous acid or hypochlorite ion). This reaction takes place at a buffered pH of 6.3 to 6.6. By simply changing reagents, the CL17 also measures *total* residual chlorine (free residual chlorine plus mono-, di- and trichloramines). This is done by adding potassium iodide to the sample – chloramines in the sample oxidize iodide to iodine, which then oxidizes the DPD indicator to the magenta color at a buffered pH of 5.1.

0 to 5 mg/L free or total residual chlorine

Accuracy
±5% or ±0.035 mg/L as Cl_2, whichever is greater

Precision
±5% or 0.005 mg/L as Cl_2, whichever is greater

Minimum Detection Limit
0.035 mg/L

Cycle time
One complete sample analysis every 2-1/2 minutes

Sample Conditioning
Inlet Pressure
1 to 75 psig

Sample Flow Required
200 mL per minute minimum flow rate required

Sample Temperature Range
5°C to 40°C

Operating Temperature
5°C to 40°C

Operating Maximum Humidity
90% at 40°C

Interferences
Other oxidizing agents such as bromide, chlorine dioxide, permanganate and ozone will cause a positive interference. Hexavalent chromium will cause a positive interference: 1 mg/L Cr6+ = approximately 0.02 mg/L as Cl_2
Hardness must not exceed 1,000 mg/L as $CaCO_3$

Recorder Outputs
One 4-20mA with an output span programmable over any portion of the 0 to 5 mg/L range
130 V isolation from earth ground

Alarms
Two alarms selectable for sample concentration alarm, analyzer system warning or analyzer system shut-down alarm; each is equipped with an SPDT relay with contacts rated for 5A resistive load at 230 VAC

Optional External Outputs
AquaTrend Network interface

Power
100-115/230 VAC 50/60 Hz (switch selectable), 90 VA maximum

Sample Inlet Connection
1/4-inch OD tube, quick-disconnect fitting

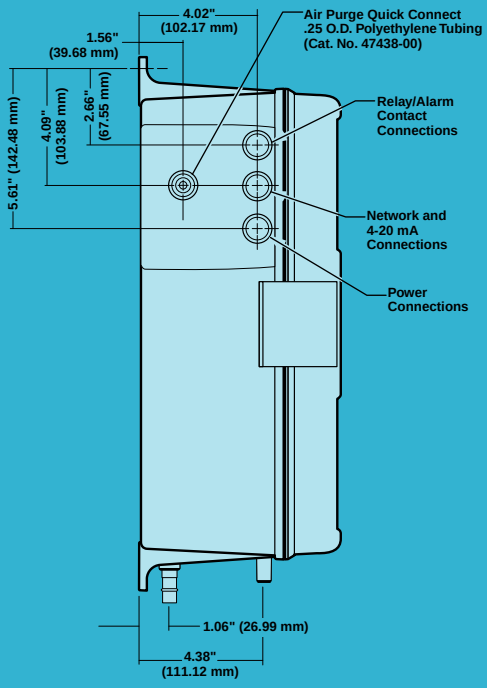
Drain Connection
1/2-inch ID flexible hose

Air Purge (optional)
1/4-inch OD tube, quick-disconnect fitting, 0.1 cfm instrument quality air at 20 psig maximum

Certification
CE approved
ETL listed to UL 1262
ETL certified to CSA 22.2 No. 142

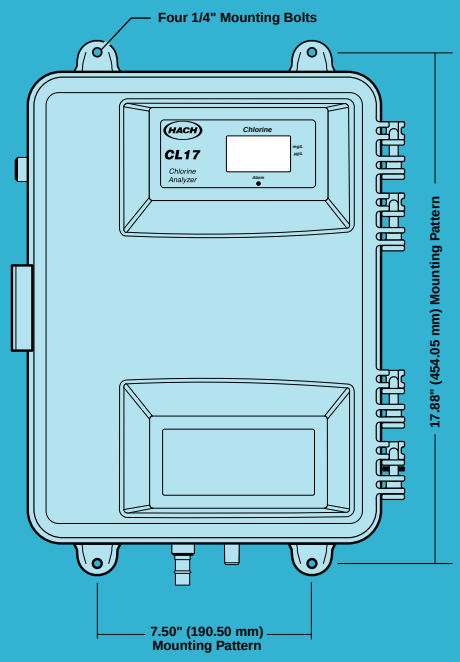
Enclosure
ABS plastic, IP62 enclosure rating with two clear polycarbonate windows

Dimensions
Approximately 16.5" tall, 12.5" wide, 7" deep



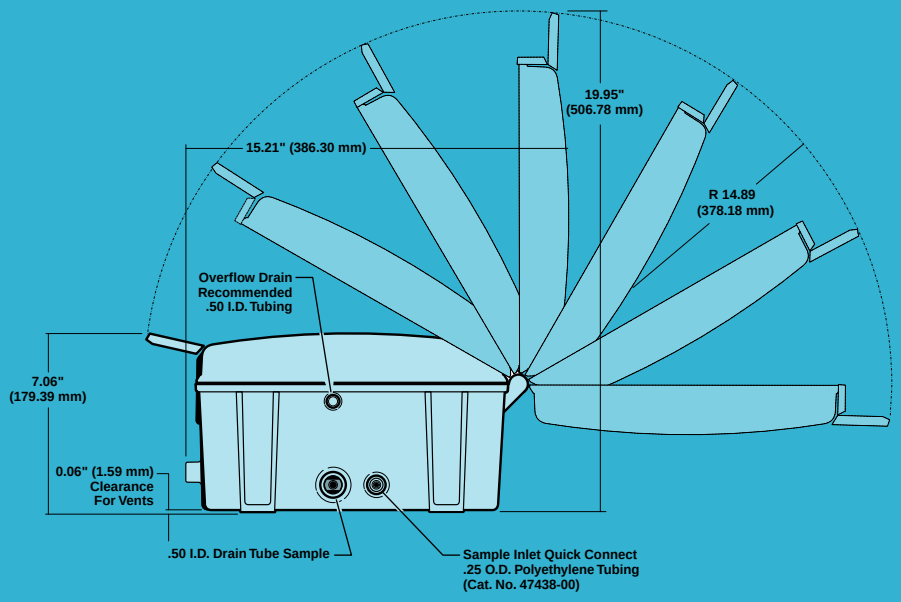
Mounting
Wall mount

Shipping Weight
25 lbs. (11.3 kg)



**Subject to change without notice.*

Installation



The CL17 is designed to be wall-mounted in minutes with four 1/4-inch screws. Adequate clearance must be left at the sides and bottom of the case for plumbing and electrical connections. The sample inlet connection is 1/4-inch quick-disconnect fitting and the drain connection is 1/2-inch I.D. flexible hose. Electrical connections are inside the instrument case. Holes for three 1/2-inch conduit fittings are provided.

How to Order

Hach CL17 Chlorine Analyzers are shipped with a one-month supply of reagents, spare pump tubing, a wall mounting kit and manual. The power cord is ordered separately.

Call Hach today to order the CL17 Chlorine Analyzer for your application.

Catalog #	CL17 Analyzer Model
54400-01	Model CL17 Free Residual Chlorine Analyzer
54400-02	Model CL17 Total Residual Chlorine Analyzer
54400-03	Model CL17 Free Residual Chlorine Analyzer with AquaTrend Network Capability
54400-04	Model CL17 Total Residual Chlorine Analyzer with AquaTrend Network Capability

Accessory

46964-00	Power Cord, 125V, 10A, 1.83 m (6')
47439-00	Power Cord, 230V, 10A, 1.83 m (6') Continental European plug
54443-00	Maintenance Kit* (1 year)
54443-01	Maintenance Kit with pre-assembled tubing* (1 year)
46436-00	Flow Meter with 1/4-inch OD tubing
44278-00	Serial I/O Kit (optional)

Additional Reagents

One unit each of three reagents (DPD indicator powder**, indicator and buffer solutions) is sufficient for 30 days of operation. Reagent sets include all three of the required reagents, sufficient for a 30-day operating period.

Catalog #	Reagent
25569-00	Reagent Set, Chlorine Free CL17
25570-00	Reagent Set, Chlorine Total CL17
22972-55	DPD Indicator Powder (free and total)
23140-11	Free Chlorine Indicator Solution, 473 mL
23141-11	Free Chlorine Buffer Solution, 473 mL
22634-11	Total Chlorine Indicator Solution, 473 mL
22635-11	Total Chlorine Buffer Solution, 473 mL

* Kit includes tubing, caps, funnel and fittings.
**DPD indicator powder is added to indicator solution.

Typical Proposal Specification

The chlorine analyzer shall employ a DPD colorimetric method of measurement using DPD indicator and a buffer solution and be capable of measuring free or total residual chlorine by changing the indicator and buffer solutions. A measurement shall be taken every 2.5 minutes and results displayed by a three digit LCD readout in the range of 0 to 5 mg/L. The analyzer shall be designed for 30-days unattended operation and use only 473 mL of each reagent per month.

Oper ating with an LED light source with a peak wavelength of 510 nm, the instrument shall be constructed to measure a sample blank before each sample measurement to provide automatic zero reference to compensate for sample color and turbidity and changes in light intensity due to voltage fluctuations or light source aging. The instrument shall provide a minimum detection limit of 0.035 mg/L or better, precision better than ±5% or 0.005 mg/L as Cl_2, accuracy better than ±5% or 0.035 mg/L as Cl_2.

The analyzer shall be microprocessor-controlled and provide a 4-20 mA recorder output as well as 2 alarms. Each alarm is user-selectable for sample concentration alarms (high or low), analyzer system warnings, or analyzer system shut-down alarms. The sample concentration alarms shall be fully adjustable through the entire range. The system warning shall activate for minor variations in analyzer performance. A system alarm shall activate for major variations in analyzer performance and it shall shut down the analyzer until corrective action is taken. The microprocessor also shall provide self-diagnostic functions accessible through an alphanumeric, menu-driven keyboard. Two SPDT normally open/normally closed dry contact relays rated at 5A resistive load at 230 VAC shall be provided.

Recorder outputs shall be a 4-20 mA. Recorder span minimum and maximum values shall be operator programmable at the menu-driven keypad over the entire operating range.

The chlorine analyzer shall be housed in an IP-62 rated, ABS plastic enclosure which is designed for wall mounting. The enclosure shall have two clear polycarbonate windows for viewing the measurement readout and reagent levels. Power requirements shall be 100-115/230 VAC, 50/60 Hz, switch selectable, 90 VA maximum.

PAGE LEFT BLANK ON PURPOSE

MIOX ON-DEMAND CHEMISTRY

Water Quality Guidelines

Knowing what to look for when sizing a system will help remove hidden surprises after installation. Most of the items on the following list will be below the limits but should be checked nonetheless. Concentrations or measurements in brine feed water and/or treated water that are less than the stated limits are not anticipated to have the stated effect. These factors can affect the oxidant demand of each individual water system, the oxidant production of the MIOX system, or the life of the cell itself. It is important to use "worst case" measures since water quality can vary from season to season.

PARAMETER	MEASURE	LIMIT	WHAT IS IMPACTED		
			Oxidant Demand	Chlorine Production	Cell Life
Total Hardness **	grains/gal (or mg/L)	<3 grain (<51 mg/L)		•	•
Iron (Fe) **†	mg/L	<1 mg/L **	•		•
Manganese (Mn)	µg/L	<50 µg/L **	•	•	•
Fluoride (Fl)	mg/L	<1 mg/L			•
Silica (SiO_2)	mg/L	<80 mg/L		•	•
Bromide	mg/L	<50 mg/L			•
Cyanide	mg/L	<1 mg/L			•
Lead (Pb)	mg/L	<2 mg/L			•
Dissolved Sulfides (as H_2S)	mg/L	***	•		
Ammonia Nitrogen (NH_3-N)	mg/L	***	•		
Organic Nitrogen (Org-N)	mg/L	***	•		
Total Organic Carbon (TOC)	mg/L	***	•		
pH	-	5-9		•	•
Water Temperature Range ^	°F (or °C)	55-80 °F (12-27°C)		•	•

**Caution: water softeners will remove these components up to a limit. See references to maximum ferrous iron and manganese in water softener documentation. Total hardness affects cell life only in that higher hardness requires acid washing to remove carbonate deposits from the cell. Use of water softened to < 1 grain hardness should not require acid washing of the cell.

*** Oxidant demand is affected by any level of H_2S, ammonia or organic nitrogen, or TOC.

† Iron may deposit $Fe(OH)_3$ on the anode, causing an electrical "blind", which would increase the brine proportion pump signal voltage (brine proportion pump speed) needed for the system to reach the operating window. Chlorine production would remain the same, but salt conversion effi ciency will decrease. The same effect is true of silica on the cathode.

^ The system will operate with water temperatures outside this range; however, there will be a performance change. Follow the system specifications for absolute limits.

Salt Quality Guidelines

PAGE LEFT BLANK ON PURPOSE

MIOX SALT GUIDELINES

Revised June 17, 2014

SALT GUIDELINES FOR MIOX GENERATORS

General Information

MIOX Corporation (MIOX) places importance on the quality of salt used in operating on-site generation equipment. High quality salt minimizes expense and customer equipment maintenance issues while maximizing the quality of the water treated using MIOX equipment. MIOX recommends food grade salt to help optimize MIOX system performance. Because contaminants can vary widely, even within the same mine, it is vital to request the most recent site specific contaminant analysis. The contaminant analysis should document the date that quality control was performed and the physical location where the salt was mined and processed. MIOX recommends that our customers regularly request salt product data sheets from the manufacturer to ensure consistent quality control. A reputable supplier will include the date of the quality analysis on the specification sheet in addition to the salt mine location. Please note, higher quality salt alone will not ensure reduced maintenance. Water used by the MIOX system must be softened adequately as well.

Warranty

MIOX continually strives to review and address all warranty claims in an equitable manner. It is important for our customers to understand that the use of poor quality salt may impact warranty claims. MIOX does not accept liability for any salt selected by the customer for use in MIOX equipment. MIOX reserves the right to deny any claims that could be considered under warranty if the equipment or electrolytic cell is performing below specification or is damaged due to contamination caused by, but not limited to, calcium, magnesium and insoluble material in a salt selected by the customer. NOTE: self-cleaning MIOX systems require the use of salt with a purity of 99.5% NaCl or greater (typically food grade) as described in the “Salt Purity” section below or the warranty is void.

Salt Purity

For all **self-cleaning systems,** only salt with a purity greater than 99.5% may be used (typically food grade) or the warranty is void. For all **non-self-cleaning systems,** MIOX recommends salt with a purity level of 99.5% NaCl or greater. Below is a table depicting what MIOX recommends for **non-self-cleaning systems** and what MIOX requires to keep the warranty intact for **self-cleaning systems.**

Component	Percent Minimum
NaCl (dry)	99.5
Impurity	**Percent Maximum**
Calcium (in all forms)	0.01
Magnesium (in all forms)	0.01
Manganese	0.00002
Iron (as Fe)	0.0005
Insolubles	0.005
Additives	0.0001

For several reasons, salt quality is highly variable and MIOX cannot control the quality processes at salt manufacturing sites. Typically, salts with fewer contaminants are more expensive because of additional purification steps during processing. Salt manufacturers usually provide salt product data sheets that list contaminants of concern in each type of salt they sell. Customers assume that the delivered salt will meet the specifications provided by the manufacturers. However, not all contaminants of concern for a specific application will be listed. For example, bromide in salt used for electrolysis can elevate the concentration of bromate in the treated water. Bromate is a water quality concern in drinking water applications, but not necessarily industrial applications.

There are three primary contaminants commonly listed in a salt product data sheet that impact the electrolytic cell; calcium (Ca), magnesium (Mg) and insoluble material. High calcium and magnesium salt concentrations cause accumulation of calcium/magnesium carbonate and magnesium hydroxide in the electrolytic cell. Fouling by these deposits in the cell is the single largest cause of maintenance issues. Insoluble material or solids present in the salt that do not dissolve in water can also deposit in the cell along with carbonates. This co-deposition tends to reduce the effectiveness of acid to remove the carbonates. As a result, longer acid wash times and sometimes physical scrubbing of the cell plates is required to remove the deposit. Other contaminants, such as manganese (Mn) and iron (Fe), are known to affect cell performance by producing an oxide layer that increases the degradation rate of the plates. MIOX recommends that the manganese and iron concentrations in salt not exceed 20 parts per billion in the electrolyte solution entering the cell. Manganese and iron are not included in MIOX's salt specification maintenance worksheet because they are not often reported on salt product data sheets. However, low concentrations of Mg and Ca are associated with low concentrations of Mn and Fe.

MIOX's Salt Specification Maintenance Worksheet versus Salt Manufacturer's Product Data Sheets

Although MIOX makes recommendations on the ideal salt for use in the on-site generation process, it is the customer's responsibility to obtain a salt quality analysis (salt specification or product data sheet) from the supplier and determine its suitability for their situation, region and application.

The salt manufacturer's product data sheet should contain information regarding the amount of calcium, magnesium and insoluble material in the salt at a minimum. MIOX and its customers use this standard information to estimate the amount of maintenance that is associated with these contaminants. This salt specification maintenance table is shown below.

	Lower Limit	Upper Limit	Maintenance
Calcium (Ca) (%)	0	0.020%	Acid wash for 20 min at 3000 hrs / quarterly
	0.020%	0.05%	Acid wash for 20 min at 750 hrs / monthly
	0.050%	0.08%	Acid wash twice for 20 min each at 24 hrs / daily
	0.080%	---	Calcium too high
Magnesium (Mg) (%)	0	0.020%	Acid wash for 20 min at 3000 hrs / quarterly
	0.020%	0.05%	Acid wash for 20 min at 750 hrs / monthly
	0.05%	0.08%	Acid wash twice for 20 min each at 24 hrs / daily
	0.08%	---	Magnesium too high
Insolubles (%)	0	0.01%	Change brine filter at 750 hrs / monthly
	0.010%	0.05%	Change brine filter at 325 hrs / biweekly
	0.050%	0.1%	Change brine filter at 24 hrs / daily
	0.10%	---	Insolubles too high

Please note that the manufacturer's product data sheets do not always give these contaminant concentrations in a standard form and the listing may refer to a brand of salt sourced from different salt mines. Different salt mines have different quality parameters. Be sure to request the salt product data sheet that is specific to the salt you will use in the MIOX system, including the mine location. For drinking water applications, the amount of bromide that may be present in certain salts should be evaluated because bromide can be converted to bromate in the cell.

Additives

Most salts have four basic types of additives:

- Hardening agent (Sodium Hexametaphosphate or SHMP)
- Cleanser (Citric Acid based)
- Free flowing/anti-caking agent (Yellow Prussiate of Soda or YPS)
- Detergents/surfactants

MIOX does not recommend the use of salt with additives. However, some customers have successfully used salts with these additives. Note that detergents/surfactants in the salt may cause foaming in the oxidant tank and reduce the effectiveness of the hydrogen venting system due to foam. It may be necessary to increase the vent pipe size. Organic additives such as citric acid can also be a source for additional trihalomethanes and haloacetic acids.

Physical Salt Size

Salt that is coarse or extra coarse is preferred. Granular or pelletized salt can be used equally well but requires some extra attention. Pellets that are larger than about ½ inch in size dissolve

slowly and can contribute to poor brine concentration in the brine tank, particularly when the salt level is low in the tank. For this reason, it is important to keep the brine generator filled at all times. Also, pelletized salt is too heavy to be pneumatically blown into large bulk brine generators.

Brine Filtration

Higher purity salt is often table quality, or food grade salt, in granular form. While this salt will work well, it requires an adaptation for both types of brine generators sold by MIOX, including the ton-sized bulk brine generators and the smaller brine generators with up to 1,000 gallons capacity. The large bulk brine generators must be filled with a two-layer washed quartz rock bed to avoid clogging of the brine intake port. The bottom layer should be 7 inches of quartz rock deep, using rock sizes between ¼ and ½ inch. The top layer should be 5 inches of quartz rock deep, using rock sizes between 1/8 and ¼ inch in size.

For smaller brine generators that utilize granular (fine grain) salt, a special in-tank roughing filter assembly must be used. Contact MIOX for details on this filter assembly. External to the brine generator and prior to the MIOX on-site generator cabinet, a 5-micron filter is required. This usually takes the form of a 10-inch standard filter housing with a 5-micron pleated filter cartridge element. A dual filter housing arrangement is also available to facilitate filter change-out while the systems are operational.

NSF Standard 60 Salt

Several state regulatory agencies are now requiring that the source material feeding on-site generators (i.e., salt) must be NSF-60 listed to ensure that no hazardous materials ultimately enter the drinking water supply. NSF-60 ensures that chemicals in contact with drinking water are safe and non-toxic to the drinking water supply. For a list of salt suppliers that offer NSF-60 listed salt, refer to the NSF web site at www.nsf.org. Product and service listings may be found at http://www.nsf.org/business/search_listings/.

INTRODUCTION – GENERAL HYDROGEN SAFETY PRECAUTIONS

Introduction

All electrolytic cells that utilize water as a component of the electrolyte generate hydrogen gas in the cell. MIOX manages the risk associated with this hydrogen by engineering safety barriers into all phases of equipment design. These multiple safety barriers have been proven to significantly reduce hydrogen risk and ensure safety, reliability and cost-effectiveness. This document details the advantages of the engineered safety barriers designed to mitigate hydrogen by system component.

MIOX has an outstanding hydrogen safety record, and has been recognized by Hydrogen Safety, LLC as the leader in hydrogen safety for the On-Site Generator (OSG) market.

General Hydrogen Safety Precautions:

- HYDROGEN GAS IS PRODUCED IN ANY ELECTROLYTIC PROCESS AND SHOULD BE ASSUMED TO BE PRESENT IN THE OXIDANT TANK AND ROOM WHERE THE OXIDANT GENERATOR IS LOCATED.
- NO SMOKING OR IGNITION SOURCES IN VICINITY OF THE OXIDANT TANK.
- REMOVE THE OXIDANT TANK LID AND VENT THE TANK AT LEAST ONE HOUR PRIOR TO TANK MAINTENANCE. ENSURE ADEQUATE FACILITY VENTILATION.
- USE OSHA CONFINED SPACE PROCEDURES WHEN ENTERING ANY OXIDANT TANK.
- VERIFY INTEGRITY OF THE LIQUID BARRIER, DILUTION AIR, OR STANDPIPE SYSTEMS TO THE OUTSIDE OF BUILDING.
- THE DROP TUBE SYSTEM INSIDE THE OXIDANT TANK(S) MUST BE IN PLACE PRIOR TO SYSTEM OPERATION.
- HYDROGEN VENT PIPING SHALL HAVE NO VALVES, DROP LEGS (FOR ACCUMULATION OF LIQUID) OR OTHER BLOCKAGE AND SHALL BE ADEQUATELY SIZED TO AVOID BACKPRESSURE.
- IF THE ON-SITE GENERATOR IS MODIFIED OR EXPANDED, CONSULT MIOX OR TECHNICAL EXPERT TO ENSURE TANK VENT MEETS NEW SYSTEM CAPACITY.
- FOR MULTIPLE OXIDANT TANK SYSTEMS, ENSURE THE LIQUID BARRIER HYDROGEN VENT SYSTEM IS NOT CROSS VENTILATED BETWEEN TANKS .
- FOR THE DILUTION AIR VENTILATION SYSTEM, CROSS VENTILATION, OR SERIES VENTILATION, IS ACCEPTABLE. HOWEVER, DO NOT CROSS CONNECT THE LIQUID BARRIER VENT SYSTEM WITH THE DILUTION AIR SYSTEM. THE VENT SYSTEMS MUST BE VENTED SEPARATELY TO THE OUTSIDE OF THE FACILITY.
- DO NOT ADD CHEMICALS OTHER THAN OXIDANT TO THE OXIDANT TANK.
- ENSURE INSTALLATION AND FACILITY DESIGN IS IN CONFORMANCE WITH STATE AND NATIONAL BUILDING AND SAFETY CODES.

GENERAL HYDROGEN FACTS

Hydrogen has flammability limits which are considerably wider than for most other flammable gasses. The lower explosive limit (LEL) of hydrogen is 4.1% by volume in air. A concentration of hydrogen in air less than 4.1% will not be explosive because it is too "lean" in fuel. Likewise, the upper explosive limit (UEL) of hydrogen is 74.2% by volume in air. Therefore a mixture of air containing greater than 74.2% hydrogen will not be explosive, it is too "rich" in fuel. The energy to ignite hydrogen in air is also very low at .017 mJ.

Hydrogen gas (H_2) is the lightest of the gases with a vapor density of 0.069 (relative to that of air taken to be 1.0), and smallest in molecular size, making hydrogen gas difficult to contain. As such, hydrogen gas will tend to rise rapidly in a normal room atmosphere, seek the highest point in a room or container, and tend to diffuse through most materials of building construction.

For an electrolytic cell, the calculated hydrogen generation rate is 6.96 milliliter per amp-minute for each active anode electrode at standard temperature (0 ^{o}C) and pressure (1 atmosphere pressure).

MIOX CELL DESIGN MITIGATES HYDROGEN RISK

MIOX Corporation's electrolytic cells are designed for minimum cell dead volume. Excess space in the cell provides space for hydrogen gas to accumulate. By keeping the available gas volume to a minimum, the risk of creating an explosive condition is minimized. Figure 1 shows the relative gas volumes available in MIOX cells versus conventional circular cell design configurations.

All MIOX cells are designed for low rupture pressure. The cells are typically operated at 15 psi or less and each cell is leak tested to 25 psi. By keeping the rupture pressure of the cell relatively low, less pressure can develop before a cell breach occurs should a hydrogen incident happen. To ensure a low pressure system, a rupture disk is located on the cell inlet. When cell pressure exceeds 28 psi the rupture disk will fail and the system will fault. This failure provides a release path for built up pressure in the cell, greatly decreasing the severity of an overpressure event in the cell.

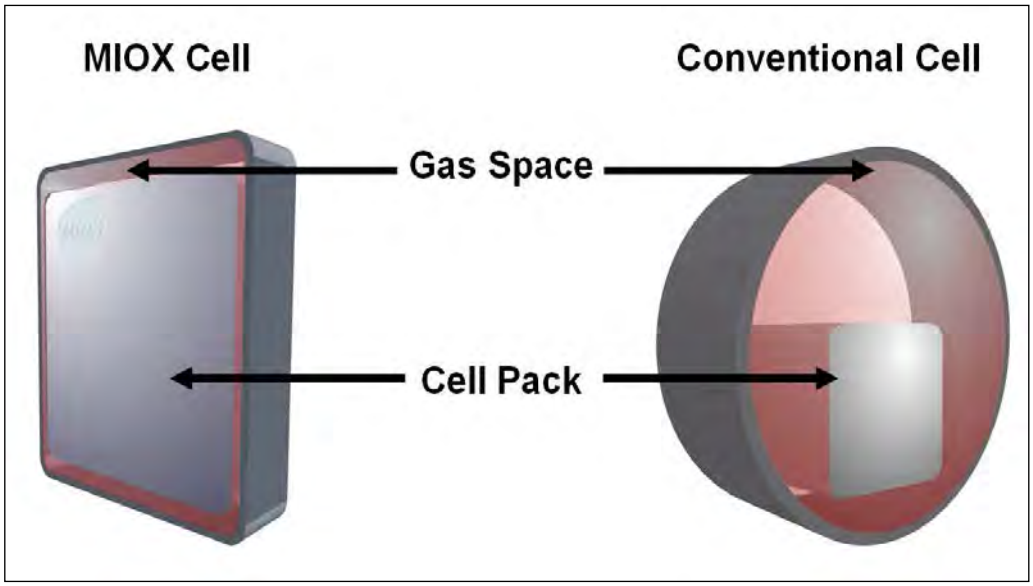

Figure 1. Gas Volume Space in MIOX vs. Conventional Circular Cells.

MIOX OSG ENCLOSURES LOWER HYDROGEN RISK

The RIO Enclosure (Applies to RIO M1-M5 and H1-H5 systems)

To protect operators from a hydrogen or pressure event that may occur within the cell, the larger MIOX systems (whether mixed-oxidant or sodium hypochlorite generators) are housed in an aluminum frame structure combined with rotational-molded, double-walled, linear polyethylene close-out panels that are attached on all sides using ¼-20 stainless-steel fasteners. No latches are employed on the cell compartment access panels. The cell is positioned on a rotational-molded tray that provides downward impact resistance due to the material flexibility. The panels are configured to be hollow with 1/8 inch thick wall sections that are spaced variously (wall to wall spacing) up to 3.00 inches providing flexibility and overpressure expansion allowance to contain any loose components that may be ejected from a ruptured cell. The panels not only provide double wall flexible impact resistance, but the windows in the cell compartment are polycarbonate (Lexan) to provide additional flexibility and safety, and are adhesive bonded to the inner window frame section. The upper cell close-out panel includes a vented window that is attached from the outside with nylon cap-head screws to provide an immediate blow-out path. The removable panels incorporate vent holes within the panels to exhaust gases that may be ejected in a cell detonation event. To verify the integrity of this design concept, the system was rigorously safety tested.

Figure 2 – RIO Enclosure

Stainless Steel Mid and Large Series Enclosures

(Applies to MIOX-25X, MIOX-50X, MIOX-100X, MIOX-250X MIOX-500X, HYPO-50X, HYPO-100X, HYPO-200X, HYPO-500X)

As discussed in the previous section, to protect operators from a hydrogen event that may occur within the cell, the larger MIOX systems (whether mixed-oxidant or sodium hypochlorite generators) are enclosed in stainless steel cabinets (See Figure 3). The front doors of the cabinets are double latched and incorporate internally mounted Lexan® windows that will contain any loose components that may be ejected from a ruptured cell.

The backs of the cabinets have removable panels for rear access. The removable panels incorporate vent holes within the panels to exhaust gases that may be ejected in a cell detonation event. In some systems, the rear panel is a plastic see-through panel held in place with plastic screws. In the case of a cell detonation event, the plastic panel acts as a blast panel to the rear of the cabinet. To verify the integrity of this design concept, the system was rigorously safety tested.

Figure 3 – Stainless Steel Enclosure

LIQUID BARRIER HYDROGEN VENT SYSTEM

The Liquid Barrier Hydrogen Vent (LBS) system (see Figure 3) uses a gas trap system to prevent hydrogen gas produced during the electrolysis process from entering the oxidant storage tank. Each oxidant tank is equipped with a drop tube in the oxidant tank that hydraulically locks the oxidant solution similar to a "P-trap" system in household plumbing. The hydraulic lock creates a liquid barrier preventing hydrogen gas from entering the oxidant storage tank.

The materials of construction for Oxidant Tank Vent and the Liquid Barrier Hydrogen Vent must be CPVC piping as specified by MIOX, and they should be run at least 12" clear of any heat or electrical sources, such as overhead lights or control boxes. No metal piping material may be used for these vents.

The generally accepted limit for hydrogen accumulation is 25% of the LEL, or 1% hydrogen by volume. These limits are easily maintained with the Liquid Barrier Hydrogen Vent System, and have been validated through rigorous testing.

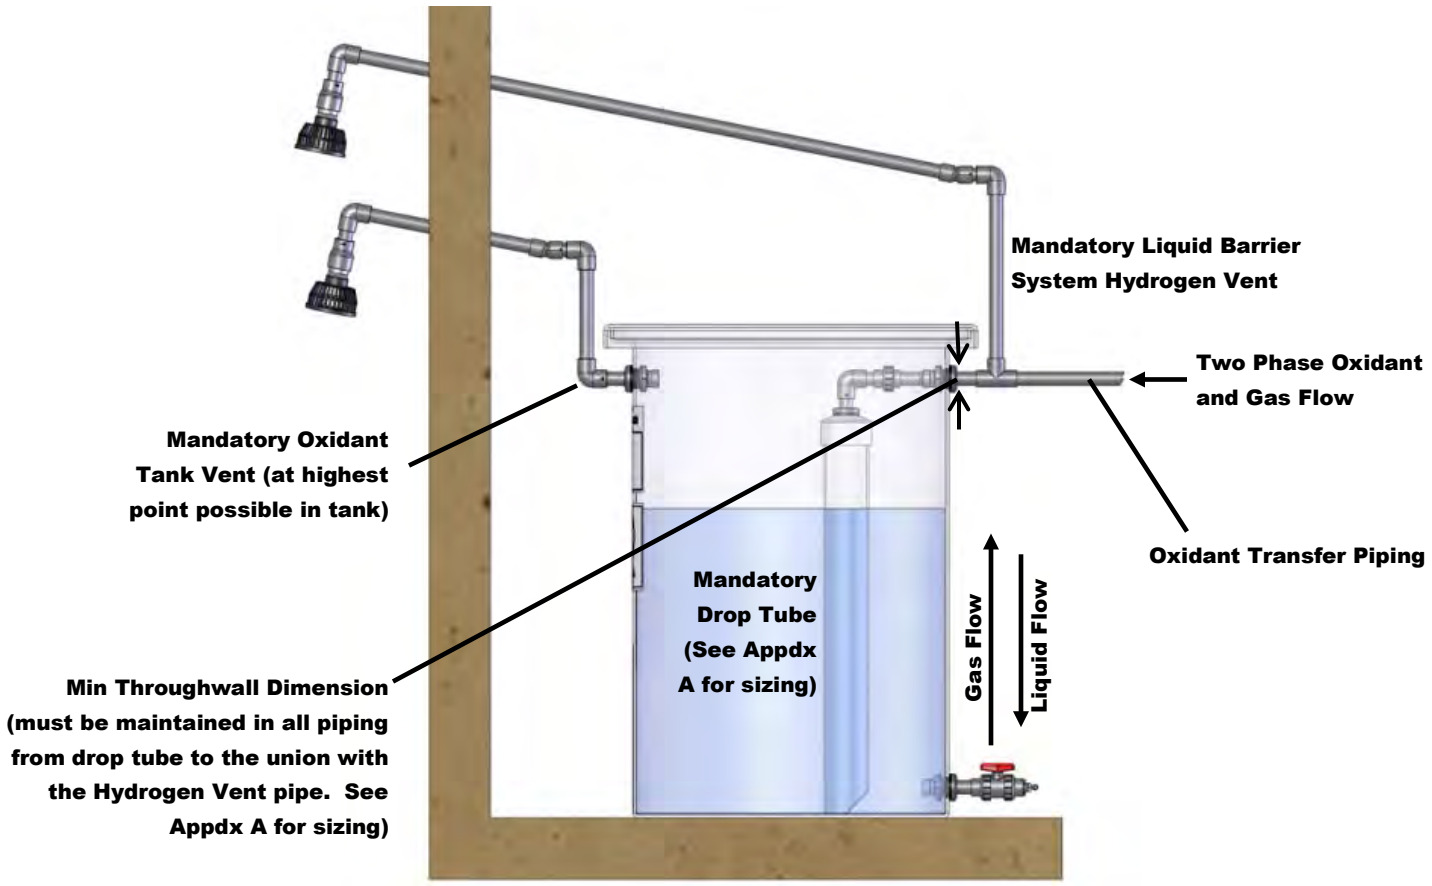

Figure 3. Liquid Barrier Hydrogen Vent System

Drop Tubes

The drop tubes are sized for each system to ensure hydrogen gas separation. The drop

tube diameter must be of adequate volume to ensure that the downward velocity of fluid is slower than the upward flow of bubbles in the liquid stream (See Appendix A for proper sizing). Additional new oxidant generation capacity will increase the volume of fluid entering the drop tube. This may require that the drop tube diameter be increased to ensure effectiveness of the system. The drop tube in the oxidant tank rests on the bottom of the tank. The bottom of the drop tube requires a notch with a 45 degree cut half way to the center of the pipe. The highest point in the drop tube notch must not extend more than 3 to 4 inches above the bottom of the tank to ensure that hydraulic "lock" occurs at a low liquid level in the bottom of the oxidant tank. The drop tube diameter should be maintained within the oxidant tank, through the penetration in the tank and just to the outside of the tank. The oxidant feed line from the on-site generator, as well as the liquid barrier system hydrogen vent lines, need to be plumbed into the larger diameter drop tube piping on the outside of the oxidant tank. This design allows the larger diameter drop tube piping external to the oxidant tank to act as a stagnation chamber for better separation of the liquid oxidant from the hydrogen gas. Most of the hydrogen gas will be trapped and vented through the liquid barrier system hydrogen vent that discharges external to the building.

Oxidant Tank Vent

During initial startup the drop tube system will not be hydraulically "locked" until the bottom of the drop tube is sufficiently covered by liquid. During this period, some residual hydrogen may enter the oxidant tank. Also, a very small amount of hydrogen will be dissolved in the oxidant solution; the amount is a function of the temperature of the oxidant. Over time, this dissolved hydrogen will evolve from the solution into the oxidant tank space. For these reasons, a separate oxidant tank vent connected to the oxidant tank at the highest point in the tank is required. This oxidant tank vent line should be routed separately to the outside of the facility to avoid any possibility of cross ventilation between the drop tube and hydrogen vent systems. On multiple oxidant tank systems, the vent systems from each tank should be routed separately to the outside of the facility. In this manner, a tank that has been drained for service or cleaning will not have a common hydrogen vent header that could possibly allow hydrogen from the active oxidant tank to be transferred through common vent piping to the tank that is drained for service.

In general, the oxidant transfer piping between the on-site generator and the oxidant storage tank must be adequately sized to maintain a reasonably low velocity of the two-phase flow of fluid and gas within the piping to the oxidant storage tank. The piping diameter must be adequately sized for the flow from all of the cell modules tied to the manifold, whether or not all of the cell modules are intended to be operated at the same time (see Appendix A for details). Improperly sized oxidant transfer piping can cause backpressure in the system that can adversely affect the pressure within the cell as well as the proper flow rate in the cell. This can lead to cell damage. Improper oxidant transfer piping size can also cause high velocities within the piping that can entrain liquids into the hydrogen vent piping. The result is that liquid is carried out of the hydrogen vent piping which can cause oxidation damage to facilities and/or vegetation where the liquid drips from the end of the hydrogen vent piping outside the facility. This problem is particularly evident when water softener salt pellets are used in the system bring generator. Water softener salt pellets typically contain surfactants that can cause bubbles in the oxidant piping.

Oxidant Transfer Piping

It is usually desirable to have a sample port in the oxidant transfer piping in order to obtain oxidant samples for analysis. MIOX provides special OPEN-CENTER three-way ball valves with each cell module for this purpose. In addition, special Viton seat diaphragm check valves are supplied with all of the larger cell modules (25 pound per day production and greater) to prevent back flow of oxidant to the cell module when the specific cell module is in standby and other cell modules on the same oxidant manifold are operational.

To avoid shutoff of oxidant from the electrolytic cell during operation, it is important that no two-way valves or dead center three-way valves be installed in any portion of the oxidant transfer piping. This includes air or solenoid operated valves. Inadvertent closure of these valves during cell operation can cause immediate cell damage. Special open-center three way valve configurations can be assembled to allow selective transfer of oxidant from the oxidant manifold to any of several oxidant tanks. Consult MIOX Corporation for details.

Liquid Barrier System Hydrogen Vent

Liquid Barrier Hydrogen Vent piping (See Figure 3) must be properly sized to prevent high velocity liquid flow within the piping (See Appendix A). High velocity flow will prevent gas from separating from liquid in the drop tube, reducing the efficacy of the Liquid Barrier system. High velocities within the vent piping can cause backpressure and can decrease the effectiveness of the overall system. Liquid Barrier Hydrogen Vent piping must not incorporate any restrictions to flow in the pipe or flow restrictions at the discharge of the pipe (See Figure 4 and 5). No valves of any type are permitted in the vent piping. In addition, the hydrogen or dilution air vent piping must be routed to avoid any liquid traps in the plumbing. If the piping includes low points, liquid can accumulate in the low points and act as a hydraulic lock to prevent free flow of gases. Under cold weather conditions oxidant vapor or liquid in the vent pipe could freeze and block flow. In freezing climates, the exit of the vent stack outside the facility should be evaluated to ensure that it is not subject to blockage from cold weather conditions. Vent piping should be routed straight up out of the facility or at a high point through a wall. The hydrogen vent piping should slope back towards the oxidant tank so that liquids can run back to the oxidant tanks.

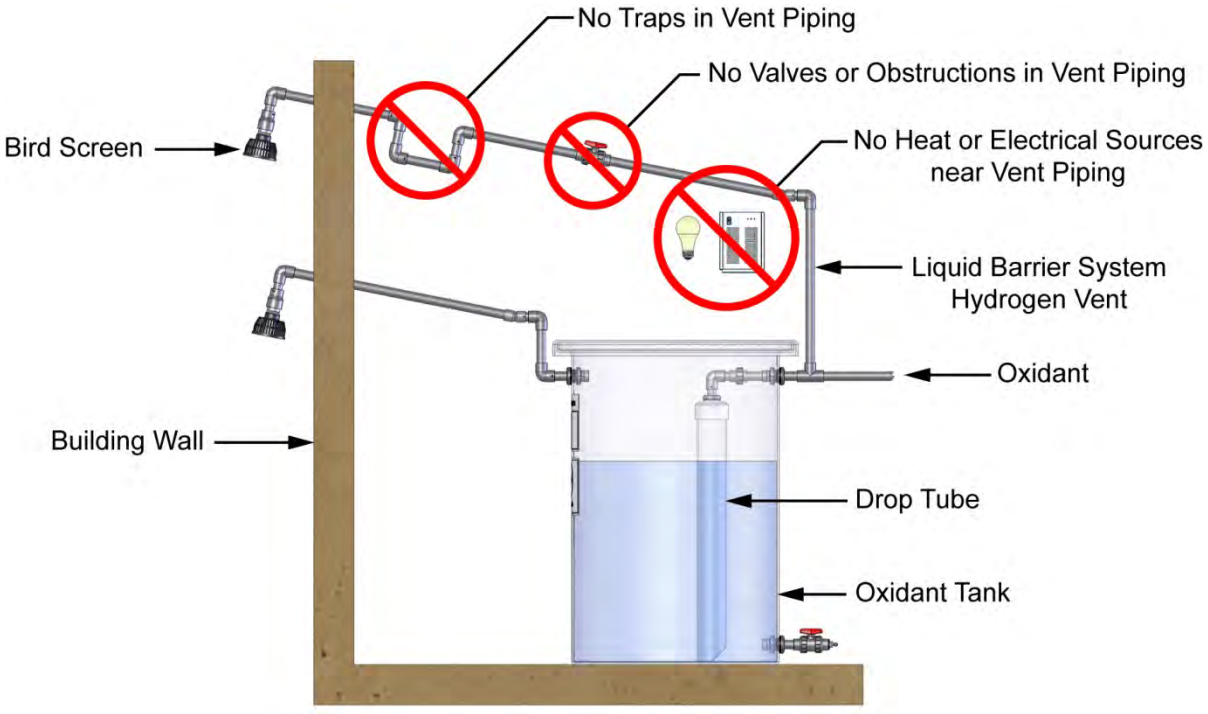

Figure 4 – Liquid Barrier Hydrogen Vent Piping "Don'ts"

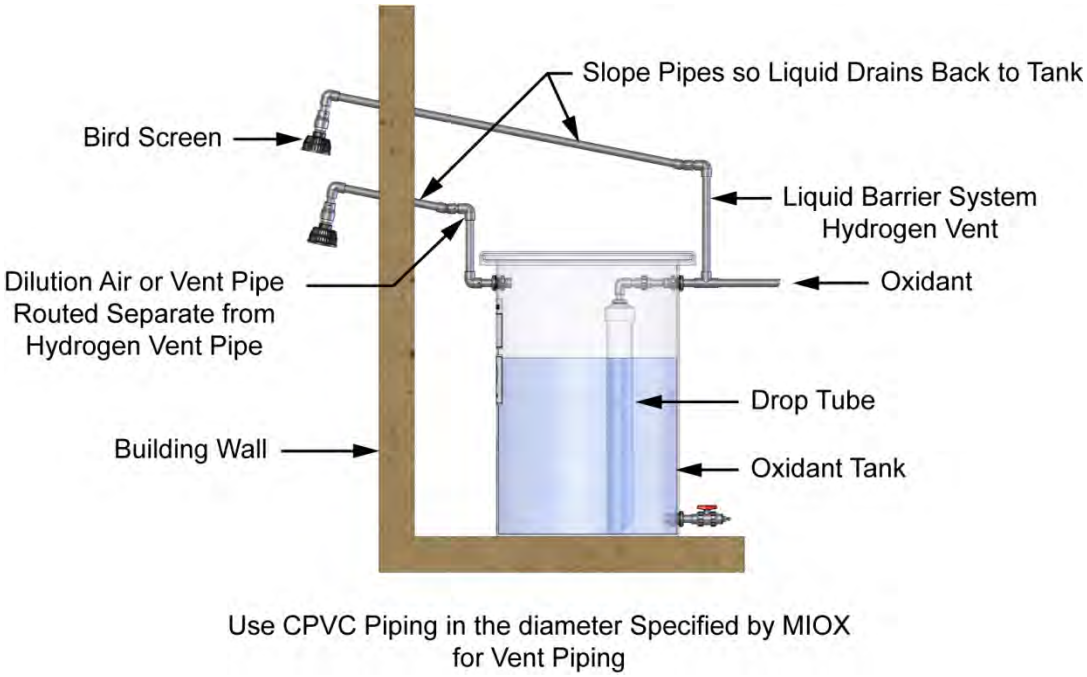

Figure 5. Liquid Barrier Hydrogen Vent Piping "Do's"

DILUTION AIR VENTILATION SYSTEMS

Dilution Air Vent System Principles.
Dual fan-driven Dilution Air Ventilation systems are offered as a supplement to the standard Liquid Barrier Hydrogen vent system. All dilution air systems utilize redundant fans which blow air into the oxidant tank. The flow of the air into and out of the oxidant tank is enough to dilute the hydrogen concentration in the oxidant tank below 25% of the LEL. Thus, the gas in the oxidant tank would not ignite even in the presence of an ignition source. To provide discharge ventilation for the dilution air system, the oxidant tank incorporates a separate vent pipe (separate from the drop tube hydrogen vent pipe) at the top of the oxidant tank that is routed separately to the outside of the building.

By necessity, all dilution air vent systems operate under positive air pressure within the oxidant tank. Due to these conditions, the oxidant tank must be sealed. Many oxidant tanks come with vented covers. These vents must be sealed to prevent dilution air from exiting the oxidant tank. In addition, oxidant tanks may incorporate oxidant overflow ports. These ports may represent a source of dilution air discharge from the oxidant tank. To avoid this situation and still maintain the overflow, the overflow piping can incorporate a drop tube inside the oxidant tank. Internal to the oxidant tank, the overflow port should be plumbed with an elbow fitting and pipe extending down to the bottom of the oxidant tank. The end of the drop pipe should have a 45 degree angle cut in order to allow free flow of liquid in the pipe.

External Dilution Air Ventilation System
The External Dilution Air Ventilation system is configured as a dual fan system with check valves and an air flow switch to provide indication of loss of air flow, and alternate backup fan. The air flow switch is installed in the discharge piping downstream for the oxidant storage tanks just before the piping exits the facility. With the air flow switch located downstream, a leak in the oxidant tank or piping (such as a tank cover being removed) is indicated, and the system will shut down to prevent hydrogen accumulation inside the facility.

The external air vent system utilizes a separate air fan duct and plenum located external to the oxidant tank and low to the ground. The fan is a normal industrial fan that can be configured in most common electrical power arrangements. With the fan low to the ground and external to the duct, the possibility of introducing an electrical arc as an ignition source for hydrogen in the oxidant tank is minimized. The dilution air duct runs up the side of the oxidant tank and enters the oxidant tank near the top edge of the tank or on a “flat” on the top dome of the tank, or in the case of FRP tanks, in to the appropriate flange connection on the top of the tank. Information regarding Dilution Air Sizing can be found in Appendix B.

Dilution Air Ventilation systems are sized for the size of the installation, and therefore are available in a variety of ductwork pipe diameters. The duct size for the dilution air blower system is a function of pressure loss in the ductwork. As backpressure increases, blower output volume decreases. As such, backpressure must be minimized in order to maintain flow volume. An on-line program that can calculate the pressure loss in PVC ducting is located at:

http://www.freecalc.com/gasfram.htm

MIOX Corporation has selected the minimum size duct based on the appropriate flow rate and assumes 100 feet (33m) of duct piping, 6 long sweep ells, and air flow check valves. More complex duct routing systems may need to be evaluated for the specific application. A graphical representation of both the Liquid Barrier Vent System and External Dilution Air vent system is shown in Figure 6.

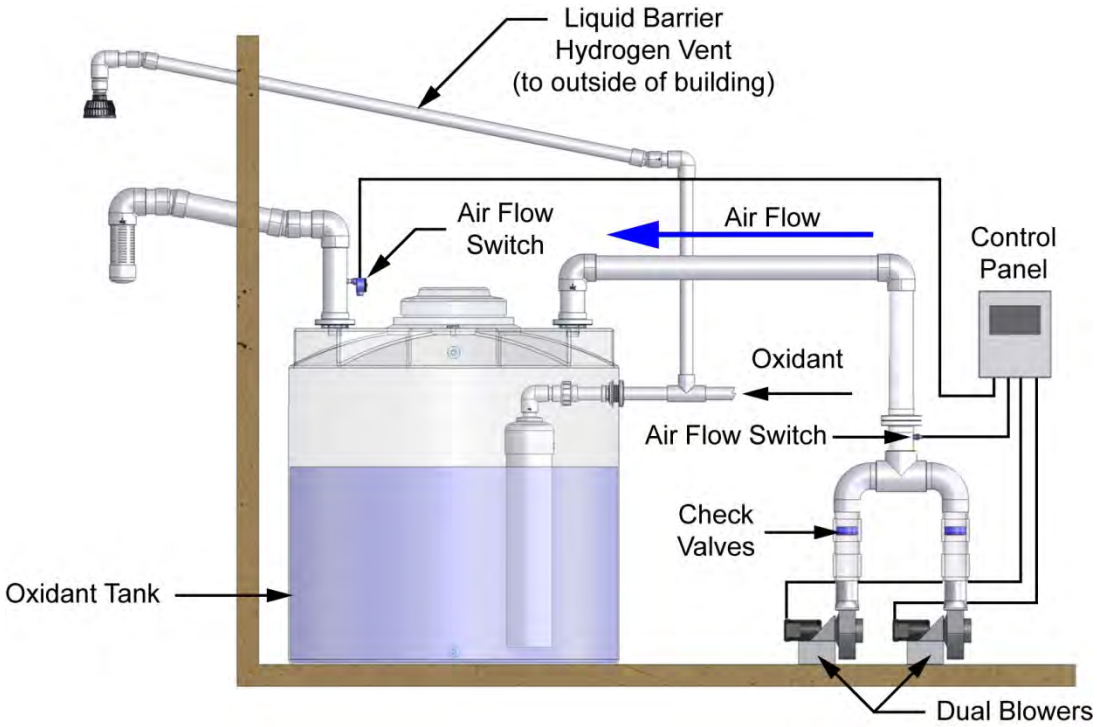

Figure 6. Dilution Air Vent System with Liquid Barrier System

External Dilution Air Vent Controls

The MIOX external dilution air control system consists of a stainless steel control cabinet and a separate blower manifold with dual blowers. The control cabinet is designed to be utilized for all size systems. Slightly different versions of the control cabinet are available for different fan motor voltages. Models available include 110VAC 1phase, 240VAC 3 phase and 480 3 phase. The dilution air system blower and duct sizes are chosen based upon the size and configuration of the particular system.

The control panel incorporates the following functions:

- On first time power up, it performs a test to determine if each blower is operational. Also, during operation the control panel monitors the selected blower. If a blower fails, it is deactivated and the other blower is selected. Failure is detected by the absence of flow from a flow switch installed in the blower manifold.
- Upon detection of a failed blower, a fail light is lit on the front panel of the control panel for the corresponding blower. If both blowers fail both fail indicator lights will flash off and on.
- In addition to the fail indication lights, two relay outputs are provided, one that cycles off and on to indicate a single blower failure or on continuously indicating both blowers failed. This output could be used to drive a two tone buzzer or switch a remote light. The other relay turns on only when both blowers have failed. It could be used to shut down the on-site generator in the event of a double failure or switch a light or alarm. Alternatively these signals could be connected to a SCADA system for remote monitoring. The MIOX RIO system supports direct connectivity to the external Dilution air control system and will automatically suspend operation if a failure is detected. The RIO system provides the run command and three failure inputs, one for the dilution air controller and two optional inputs to support other vent system sensors where required.
- All alarm outputs have dual relay contacts and normally open and normally closed contacts to support different system interface requirements.
- The blower is turned on by applying 24v to the run input.
- The control panel has additional terminal block capacity to support a single point connection to SCADA from other possible hydrogen vent system sensors (i.e. flow switches, etc… as required)
- The system controller has a dip switch with selectable blower shutdown delay from 0 minutes to 45 minutes in 3 minute intervals. This allows the blowers to continue to run after the on-site generator is shut down to assure all hydrogen is purged from the oxidant tanks. The default setting is 15 minutes. The switch is located inside the system controller box.
- The control system randomly selects which blower to turn on each time

the command to run is received, to prevent one blower from wearing faster than the other.

- The system incorporates a manual override for maintenance and service functions. This override allows the user to select a blower. In manual mode the control module is bypassed so alarm outputs are inactive

STANDPIPE HYDROGEN MITIGATION SYSTEM

For larger installations (see Appendix C for specific installation sizes), MIOX requires a Standpipe Hydrogen Mitigation System. A depiction of this system is shown below in Figure 8. In this configuration, a relatively small external standpipe to the oxidant tank is utilized similar to the drop tube in a Liquid Barrier system. Hydrogen gas is separated from oxidant in the standpipe, and then is diluted below its lower explosive limit with a Dilution Air Blower and blown outside the building. Contact MIOX for more details on this system.

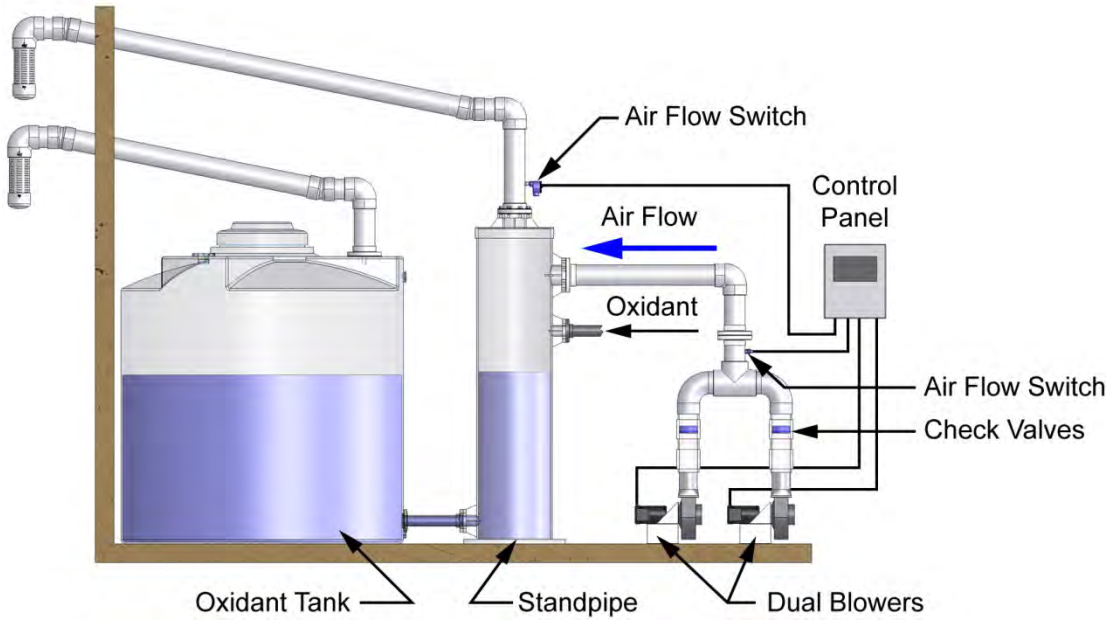

Figure 7. Dilution Air Vent System with Liquid Barrier System

RIO ZUNI SERIES - LIQUID BARRIER HYDROGEN VENT SYSTEM

In 2011, MIOX began to offer for sale the Rio Zuni series of On-Site Generators. On a relative basis, the Rio Zuni series of On-Site Generators generate a small amount of hydrogen. Thus, it is approved to route and connect the Oxidant Tank Vent to the Liquid Barrier System Hydrogen Vent. This is only approved on single Rio Zuni On-Site generator feeding single oxidant tank systems. In the case of multiple oxidant tank and/or multiple on-site generator systems, each tank must be vented independently. In all cases, all other requirements described in earlier in the section "LIQUID BARRIER HYDROGEN VENT SYSTEM" must be met.

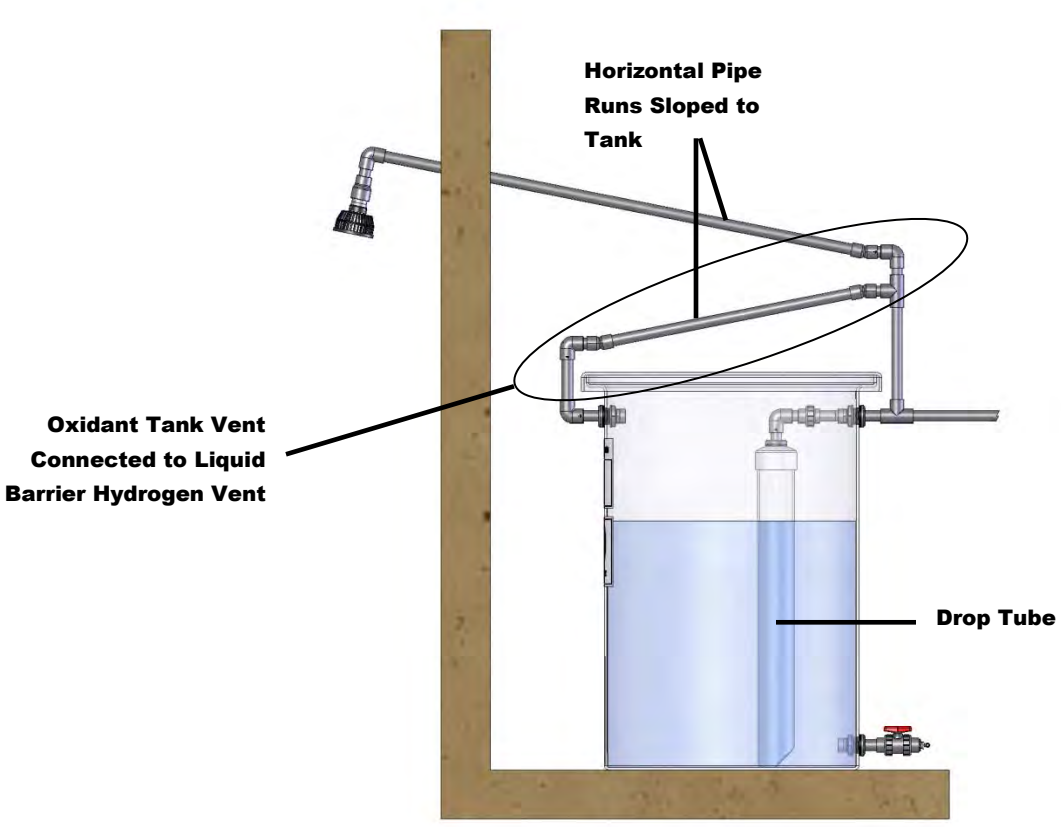

Figure 7. Liquid Barrier Hydrogen Vent System Approved for Single Rio Zuni Single Oxidant Tank Installations.

ADDITIONAL HYDROGEN RISK MITIGATION OPTIONS

HYDROGEN MONITOR

MIOX Corporation offers Mine Safety Appliance (MSA) hydrogen monitors as an optional accessory to detect and alarm the presence of hydrogen within the facility. These systems provide contact closure or 4-20 ma outputs to SCADA or other monitoring systems depending on the desired control configuration. The sensor component of the hydrogen monitor should be mounted high in the facility ceiling in an area where hydrogen gas could be trapped.

LABELING REQUIREMENTS

Safety labels and No Smoking Signs are required ON ALL OXIDANT TANKS as well as ALL HYDROGEN VENTS (Liquid Barrier Hydrogen Vents, Dilution Air Vents, and Oxidant Tank Vents) OPENINGS external to the building. These labels identify safety issues specific to on-site generated solution, as well as no smoking signs. These labels are available from MIOX Corporation, but examples are shown below in figure 9. Oxidant Tanks and Hydrogen Vents must be labeled such that the labels are clearly visible in all directions. More details on this requirement can be found in the installation guide.

CAUTION

- NO SMOKING, OPEN FLAMES, OR ANY OTHER IGNITION SOURCES IN THE VICINITY OF THIS TANK OR VENT
- PERMIT REQUIRED CONFINED SPACE, USE CONFINED SPACE PROCEDURES PER OSHA STANDARD 1910.146
- DO NOT ADD OTHER CHEMICALS TO THE TANK OR VENT
- REFER TO MIOX OPERATOR'S MANUAL FOR OTHER SAFETY RELATED PRECAUTIONS

This Tank or Vent May Contain	Statement of Hazards
• Hydrogen Gas with a Hazard Rating Identification of (0-4-0-Null)	• Flammable Gas present • Fire & Explosion Hazard present • Simple Asphyxiate Gas present
• Dilute (<1% by volume) Sodium Hypochlorite Solution with a Hazard Rating Identification of (1-0-0-Null)	• Moderate Health Hazard present • Incompatible and/or hazardous reactions can occur with addition of other chemicals, such as strong acids, strong reducing agents, amines, ammonium salts, metals, methanol, phenylacetonitrile, formic acid, and ammonia

CODE COMPLIANCE

All on-site generation equipment produces hydrogen gas which is normally contained in the piping and vent systems. Classification of facilities housing on-site generation equipment is determined by the authority having jurisdiction (AHJ). The AHJ may be a state, county, or city agency responsible for safety issues in the community. **MIOX Corporation does not make a determination of the classification for any particular installation**. This is the responsibility of the local authority having jurisdiction. Local engineering firms familiar with the codes and standards in their region are responsible for being sure that local codes are followed in their designs. Selected excerpts from The National Electrical Code, 2008 Edition are included below:

500.5 Classifications of Locations.

(A) Classification of Locations: *Locations shall be classified depending on the properties of the flammable gas, flammable liquid-produced vapor, combustible-liquid produced vapors, combustible dusts ,or fibers/flyings that may be present, and the likelihood that a flammable or combustible concentration or quantity is present…*

(2) Class I, Division 2. *A Class I, Division 2 location is a location*

(1) In which volatile flammable gases, flammable liquid-produced vapors, or combustible liquid-produced vapors are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems or in case of abnormal operation of equipment, or

(2) In which ignitable concentrations of flammable gases, flammable liquid-produced vapors, or combustible liquid-produced vapors are normally prevented by positive mechanical ventilation and which might become hazardous through failure or abnormal operation of the ventilating equipment, or ……..

FPN No. 1: This classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used but that, in the judgment of the authority having jurisdiction, would become hazardous only in case of an accident or of some unusual operating condition. The quantity of flammable material that might escape in case of accident, the adequacy of ventilating equipment, the total area involved, and the record of the industry or business with respect to explosions or fires are all factors that merit consideration in determining the classification and extent of each location.

ADDITIONAL INFO

UPSIZING CAPACITY

Since the Liquid Barrier Hydrogen vent, Dilution Air vent, and Stand-Pipe systems are sized based on the capacity of the on-site generator system, the size of the hydrogen containment systems, liquid barrier or dilution air, need to be re-evaluated if modifications are made to the system, particularly if system capacity is increased either by scaling up the electrolytic cell size or adding additional cell modules to the system.

OXIDANT TANKS

It is mandatory that the engineering parameters defined in this document in terms of hydrogen vent piping be complied with by customers and/or contractors during installation of oxidant storage tanks to ensure personnel safety.

Safety labels are also required on all oxidant tanks and vents (see above section) in addition to the labels normally provided by the tank suppliers. These labels identify safety issues specific to on-site generated solution, as well as no smoking signs. These labels are available from MIOX Corporation.

OXIDANT TANK MAINTENANCE

Periodically, oxidant tanks may need to be cleaned out, or the tank may need maintenance for leaks. Do not use any cleaning or pumping devices that can act as an ignition source to gases that may be in the oxidant tank. When tank entry is required, comply with requirements for Occupational Safety and Health Administration (OSHA) section 1910.146, Permit-required Confined Space. OSHA Section 1910.146, Appendix A has a decision tree for the requirements for entry into confined spaces. Refer to the OSHA web site:
http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=STANDARDS&p_id=9797

SECTION L

MIOX Generated Solution Safety Data Sheet

PAGE LEFT BLANK ON PURPOSE

Safety Data Sheet
MIOX Corporation

SECTION 1- CHEMICAL PRODUCT AND COMPANY INFORMATION

Product Name: On-Site Generated Mixed Oxidant Solution or On-Site Generated Sodium Hypochlorite Solution.
Synonyms: Hypochlorite Solution, Mixed Oxidant Solution
Manufacturer's Name: MIOX Corporation
Address: 5601 Balloon Fiesta Parkway, Albuquerque, New Mexico
Product Information Phone Number: 1-866-MIOX-HLP (1-866-646-9457)
Emergency Contact: 1-866-MIOX-HLP (1-866-646-9457)
Recommended Use: Product is generated as needed with minimal storage. Potable, recreational, and industrial water treatment and disinfection; surface sanitation.

SECTION 2- HAZARDS IDENTIFICATION

Pictogram:
Signal Word: CAUTION.
Hazard Statements:
H303 May be harmful if swallowed.
H316 Causes mild skin irritation.
H320 Causes eye irritation.
H402 Harmful to aquatic life
Precautionary Statements:

P264	Wash skin thoroughly after handling.
P273	Avoid release to the environment.
P280	Wear protective gloves/protective clothing/eye protection/face protection.
P301+P330+P331	If SWALLOWED: Rinse mouth. Do not induce vomiting
P302+P362+P353	If ON SKIN: Take off contaminated clothing and wash before reuse. Rinse skin with water/shower.
P304+P340	If INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing.
P305+P351+P338	If IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
P313	Get medical advice/attention.
P391	Collect spillage.
P501	Dispose of content/container to an approved waste disposal plant.

Other Hazards: Hazards associated with On-Site Generation of chemicals are largely associated with the hydrogen gas that is generated during the electrolytic process. Please consult MIOX for more information on hydrogen safety, as it is outside the scope of this document.

SECTION 3- COMPOSITION INFORMATION

Chemical Name	Common Name	Percent by Weight	CAS Number
Sodium Chloride	Salt	< 3%	7647-14-5
Sodium hypochlorite	Bleach	< 0.9%	7681-52-9
Other oxidants	N/A	Trace	N/A
Water	N/A	Balance	7732-18-5

Trade Secret Statement: The exact percentage of each component has been withheld as this information is considered a trade secret.

SECTION 4- FIRST AID MEASURES

Inhalation: If chlorine vapors are inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, provide oxygen and get medical attention immediately.
Ingestion: If swallowed, do not induce vomiting. Give large quantities of water. Never give anything by mouth to an unconscious person. Get medical attention immediately.
Skin Contact: Immediately remove clothing from affected area and wash skin with flowing water. Clothing should be discarded or washed before reuse. Obtain medical attention if irritation persists. Do not instruct person to neutralize affected skin area.
Eye Contact: Immediately flush eyes with plenty of water for at least 15 minutes, while holding eyes open. Contacts should be removed before or during flushing. Do not instruct person to neutralize. Get medical attention if irritation persists.
Note to Physician: Dilute sodium hypochlorite solutions such as these products are mildly alkaline but potentially corrosive to the digestive tract. For exposure by ingestion, do not use emesis, lavage or acid antidotes. Dilute immediately by giving milk, melted ice cream, beaten egg white, starch paste or antacids such as milk of magnesia, aluminum hydroxide gel, or magnesium trisilicate gel. Avoid sodium bicarbonate because of carbon dioxide release. Sodium thiosulfate solution may prove beneficial by reducing unreacted material.

SECTION 5- FIRE FIGHTING MEASURES

Fire Fighting Procedures: Use self-contained breathing apparatus and full protective equipment. Acid contamination will produce irritating chlorine fumes.
Fire and Explosion Hazards: This product is non-flammable and non-combustible. Vigorous reaction is possible with organic materials or strong reducing agents that may result in fire.
Hazardous Products of Thermal Decomposition and/or Combustion: Oxygen and chlorine are hazardous products of decomposition of sodium hypochlorite.
Special Information: If the solution is accidentally mixed with strong acids, chlorine vapors will be released.
NFPA Ratings: Health- 1 Flammability- 0 Reactivity- 0 Other- None.

SECTION 6- ACCIDENTAL RELEASE MEASURES

Collect liquid in an appropriate container or absorb with an inert material (i.e. dry sand, vermiculite, earth). Ventilate area of leak or spill, and prevent contact with incompatibles. Clean up spills immediately and wear appropriate personal protective equipment as specified in Section 8. Isolate hazard area. Keep unnecessary and unprotected personnel from entering. Contain and recover liquid when possible, and dispose of in compliance with all Federal, Local, and Provincial laws and regulations (Regulations may vary in different locations). Do not allow to enter streams, rivers, lakes, or similar bodies of water. Chlorine content of the product can be neutralized by sprinkling sodium metabisulfite or sodium bisulfite on the spilled material.

SECTION 7- HANDLING AND STORAGE

Handling: Wear appropriate protective equipment. Avoid contact with materials that are incompatible or prone to corrosion. Avoid breathing vapor, mist, or gas. Prevent contact with eyes, on skin, or on clothing. Do not ingest or inhale. Use with adequate ventilation.
Storage: Store in a cool, dry, well-ventilated area away from incompatible substances. Do not store near chemicals that may react if spillage/leakage occurs. Keep container tightly closed.
Other Comments: This substance can decompose on heating or contact with acids or reducing materials, producing corrosive gases including chlorine. This substance is a strong oxidant.

SECTION 8- PERSONAL PROTECTION/EXPOSURE CONTROL

Exposure Limits: No exposure limits have been developed for sodium chloride or sodium hypochlorite.
Personal Respirator: Non required under normal use conditions. Use NIOSH/MSHA approved organic vapor-acid-gas respirator with filter (qualified to wear respirator) during large spill clean-up or other conditions that might produce irritating chlorine-like fumes (e.g. reactions with incompatibles).
Skin Protection: Wear latex, neoprene, or rubber gloves and other protective clothing as appropriate to prevent skin contact.
Eye Protection: Safety glasses with face shield are recommended.
Ventilation Protection: Use local exhaust at points of vapor emission.
Other Protection: Safety showers and eye wash fountains, or other means of washing eyes with a gentle flow of cool to tepid tap water should be readily available in all areas where this material is handled or stored.

SECTION 9- PHYSICAL AND CHEMICAL PROPERTIES

Appearance and Odor: Colorless to light yellow-green liquid with slight chlorine odor.
Vapor Pressure and Density: Not determined.
Boiling Point: Approximately 100^{o}C.
Melting Point: Approximately 0^{o}C.
Specific Gravity: 1.03 at 25^{o}C.
Solubility in Water: Complete.
Volatile Percentage: Not applicable.

pH: 8-10.
Flash Point/Method: Not Applicable.
Evaporation Rate: Not applicable.
Auto Ignition Temperature: Not Applicable.
Decomposition Temperature: Sodium hypochlorite decomposes above 110^{o}C.
Upper/Lower Explosion Limit: Not Applicable.
Viscosity: Not applicable (Approximately that of water).

SECTION 10- STABILITY AND REACTIVITY

Stability: Stable under normal pressures and temperatures. Slowly decomposes on contact with air. Decomposition rate increases with concentration, decreased pH, and elevated temperature. Exposure to sunlight and heavy metals also accelerates decomposition.
Hazardous Decomposition Products: Oxygen and Chlorine gas.
Hazardous Polymerization: None expected.
Incompatibilities: This material is incompatible with strong oxidizing agents, acids, heavy metals, reducing agents, organics, ether, and ammonia. Extended exposure to the product causes corrosion of many metals including stainless steel.
Conditions to Avoid: Avoid using combustible material to absorb large spills. Avoid excessive heat or light exposure and contact with incompatibles. Avoid mixing with acids; lowering the pH of the solution may result in release of chlorine vapors.

SECTION 11- TOXICOLOGICAL INFORMATION

Inhalation- Acute: Inhalation of chlorine vapors causes coughing and choking, burning sensation, labored breathing, shortness of breath, severe respiratory tract irritation, and pulmonary edema.
Inhalation- Chronic: No chronic inhalation effects of this product are known.
Skin Contact- Acute: Skin contact may cause irritation, redness, blisters, and dermatitis.
Skin Contact- Chronic: Repeated or prolonged skin contact may cause skin sensitization.
Eye Contact- Acute: Eye contact causes severe irritation with redness and pain.
Ingestion- Acute: Ingestion may cause pain and inflammation of the mouth, pharynx, esophagus, and stomach; erosion of mucous membranes; vomiting; hemorrhage; circulatory collapse; cold and clammy skin; cyanosis and shallow respiration; confusion; delirium; coma; edema of pharynx; glottis and larynx with stridor and obstruction; and perforation of esophagus and stomach.
Ingestion- Chronic: No chronic ingestions effects of this product are known.
Carcinogenicity/Mutagenicity: Not listed by ACGIH, IARC, NIOSH, NTP, or OSHA.
Reproductive Effects: No reproductive effects for this product are known.
Neurotoxicity: None are known.
Other Effects: None are known.
Target Organs: Skin, eyes, respiratory tract, and digestive system.

SECTION 12- ECOLOGICAL INFORMATION

Ecotoxicity: This product is toxic to aquatic organisms. Do not allow to enter streams, lakes, etc.

SECTION 13- DISPOSAL CONSIDERATIONS

Material that cannot be used or reprocessed for use, and empty containers should be disposed of in accordance with all applicable Federal, State, Local, and Provincial regulations. Product containers should be thoroughly emptied before disposal. NOTE: state and local regulations may be more strict than federal regulations.

SECTION 14- TRANSPORTATION INFORMATION

D.O.T. Shipping Information: See product label and Bill of Lading.

SECTION 15- REGULATORY INFORMATION

CERCLA SECTION 103 (40CFR302.4): yes CAS# 7681-52-9 RQ: 100 lbs.
SARA SECTION 302 (40CFR355.30): No.
TSCA SECTION 304 (40CFR355.40): No.
SARA SECTION 313 (40CFR372.65): No.
OSHA PROCESS SAFTEY (29CFR1910.119): No.
CALIFORNIA PROPOSITION 65: No.
RCRA (40CFR261 Subpart C): If this product becomes a waste, it does not meet the definition of a characteristic waste, and no other EPA hazardous waste codes are applicable.

SECTION 16- OTHER INFORMATION

Disclaimer: MIOX Corporation provides the information contained herein in good faith but makes no representations as to its comprehensiveness or accuracy. This document is intended only as a guide to the appropriate precautionary handling of the material by a properly trained person using this product. Individuals receiving the information must exercise their independent judgment in determining its appropriateness for a particular purpose. It is the buyer's and/or users responsibility to make sure that its activities comply with federal, state, provincial, and local laws. MIOX CORPORATION MAKES NO REPRESENTATIONS OR WARRANTIES, EITHER EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION ANY WARRANTIES OR MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE WITH RESPECT TO THE INFORMATION SET FORTH HEREIN OR THE PRODUCT TO WHICH THE INFORMATION REFERS. ACCORDINGLY, MIOX CORPORATION WILL NOT BE RESPONSIBLE FOR DAMAGES RESULTING FROM USE OF OR RELIANCE UPON THIS INFORMATION.
Issue Date: 22 July 2015
NFPA Ratings: Health- 1 Flammability- 0 Reactivity- 0 Special Notice Key- None.
HMIS Ratings: Health- 1 Flammability- 0 Reactivity- 0 Protective Equipment- B (Protective eyewear, gloves).

Subject: Kirtland BFF - Activity Report for Hypochlorite Generator Installation 23AUG18
Attachments: 001 CQM Report 23AUG18.pdf; Photographic_Log_23AUG18.pdf

Issues Today 23AUG18:

None

Resolution of Issues:

NA

Work Performed Today:

- Delivery, inspection, and acceptance of the sodium hypochlorite generator

Installation Completion to Date: 0%

Work Planned for Monday 27AUG18:

- Mark equipment installation locations
- Move hypochlorite generator and supporting equipment into position
- Begin extending water and power utilities to the hypochlorite generator and supporting equipment
- Ultra-pure salt to be delivered

Regards,
Kevin McKeage, E.I.
Engineer

Attachments: 006 CQM Report 28SEP18.pdf; Photographic_Log_09_28_18.pdf

Issues Friday 28SEP18:

None

Resolution of Issues:

NA

Work Performed Today:

- Installed free chlorine analyzers
- Completed retrofit of existing injection pumps to accept new oxidant supply
- Grouted vent lines
- Final shakedown of the sodium hypochlorite generator

Installation Completion to Date: 100%

Shakedown Completion to Date: 100%

Work Planned for the week of 01OCT18:

- None, installation complete

Remaining Items:

- Final Walkthrough and Acceptance by USACE

Please let me know if you have any questions.

Issues Wednesday 17OCT18:

None

Resolution of Issues:

NA

Work Performed Today:

There were two punch list items identified during the USACE final walkthrough and acceptance on 05OCT18 that were completed today.

- Installed caution tape onto drain lines
- Wrapped up excess communication cable

Installation Completion to Date: 100%

Shakedown Completion to Date: 100%

Work Planned for the week of 22OCT18:

- None, all installation punch list items complete

EA will submit a final letter report to USACE regarding the installation of the sodium hypochlorite generator.

Please let me know if you have any questions.

Cell Part #	:	**201-01321-02**

A. FOLLOWUP ACTION ITEMS

a. None

B. SUMMARY

a. A Vault H25 (25#/day) on-site generating system was installed, started and commissioned. This is a non-self-cleaning system.

C. BACKGROUND

a. A startup service trip was scheduled for the week of September 17, 2018

D. ACTION/OBSERVATIONS

a. A sample was taken of the inlet water hardness – results approximately 9 grains per gallon.

b. The outlet of the water softener was sampled for hardness – results 1 grain or less. As a result, a #2 metering disk was installed. The softener cut sheet shows that a #2 metering disk will handle up to 40 grains per gallon.

c. Installed a hose adapter fitting on the sample port of the 3-way valve.

d. The brine tank float was set to operate at the very bottom of the tank. The float assembly was removed and reset so that the float maintains tank liquid level at approximately 50 % full.

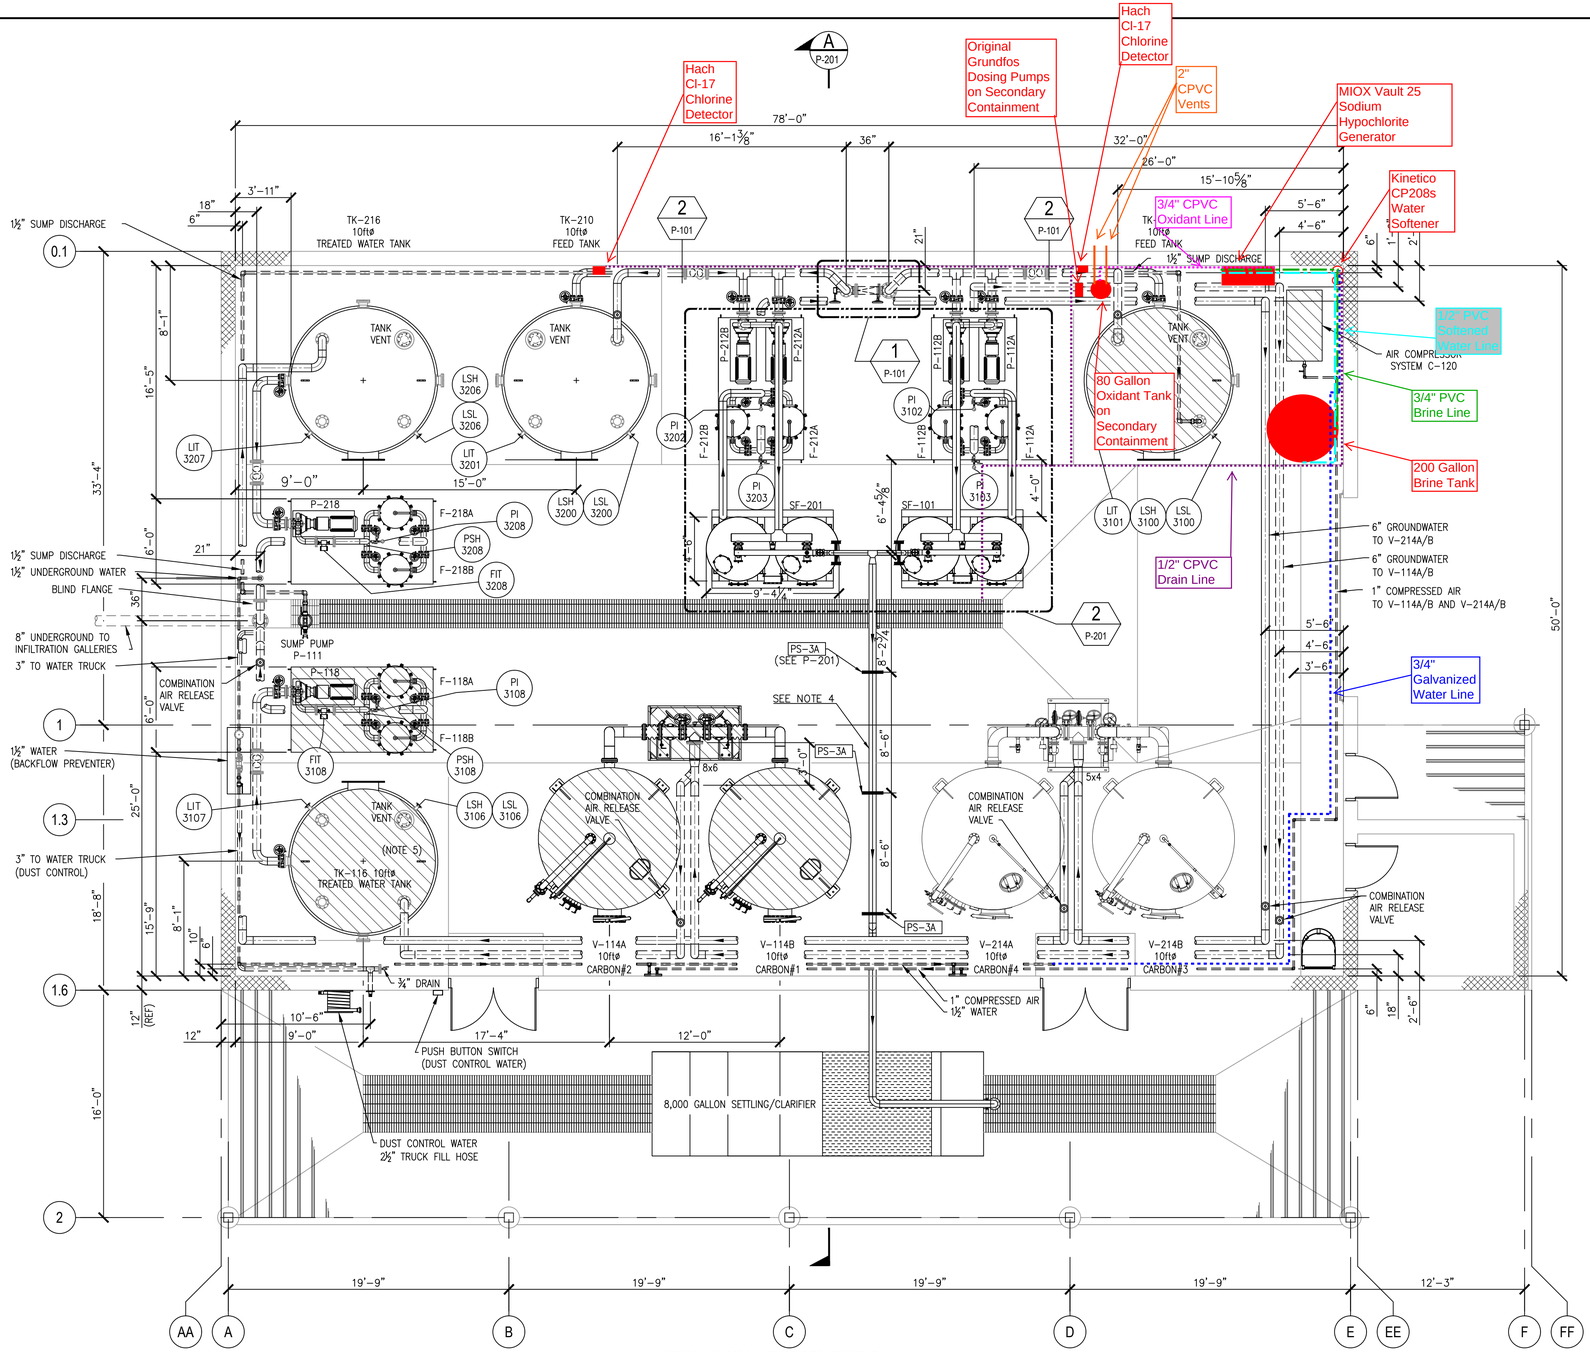
e. The regulator for the water supply to the OSG was installed before the water softener. Moved that to just before the OSG (where it belongs) so that the water softener regeneration operation does not affect supply pressure to the OSG. Adjusted inlet pressure to the OSG to 30 psi.

f. The check valve on the OSG solution discharge lines was installed before the 3-way valve. This is not a show-stopper but is normally installed after the 3-way valve.

E. DISCUSSION

a. System was started without any major issues.

F. Data



System Parameters	OSG01
Supply Voltage - phase-to-phase	238 VAC
Supply Voltage – phase-to-ground	119/119 VAC
Control Voltage	24.4 VDC
Operating Parameters	**OSG01**
Cell current – indicated (amps)	80
Cell current – actual (amps)	82.4
Cell voltage – indicated (VDC)	29

Cell voltage – actual (VDC)	29.5
System current draw (amps)	11.8
Cell PS current draw (amps)	11.2
Brine pump control voltage (VDC)	1.09
Water inlet temperature	75
Oxidant outlet temperature	105
Differential temperature	31
Water Pressure – psi (indicated)	31
Water flow - gph (indicated)	21
Cell pressure (psi)	4.5 to tank; 3.5 to sample
System Flow – gph (actual)	20 gph
Solution concentration (ppm)	7550
Production (lbs/day) GPH x PPM x 0.0002	29.91

MIOX Terms & Conditions of Purchase 08/01/2012

1. ACCEPTANCE: The terms and conditions contained herein constitute the sole terms and conditions governing the purchase by the buyer ("Buyer") stated on the face hereof of the equipment and other items specified on the face hereof ("Equipment"). Buyer shall be deemed to have accepted and agreed to these Terms and Conditions by its receipt of the Equipment or placement of a purchase order. Any terms and conditions different from or in addition to those contained herein, including any contained in Buyer's purchase order or in any other document furnished by Buyer, shall be of no force or effect in connection with the sale of the Equipment and MIOX hereby objects to and rejects in their entirety all such terms and conditions, as MIOX's agreement to sell the Equipment is expressly made conditional upon the use of these Terms and Conditions. No variation to these terms, nor any other terms and conditions by you, shall be of any effect unless such variation or terms are expressly accepted in writing, signed on behalf of MIOX.
2. TRANSPORTATION: For domestic shipments, the terms are F.O.B. MIOX dock, unless the quotation provides otherwise. For international shipments, the terms are EXW MIOX dock, unless the quotation provides otherwise. In either situation, all freight charges and other shipping costs shall be paid by Buyer. MIOX prices do not include freight charges and other shipping costs. Shipping of Equipment returned to MIOX shall be at Buyer's expense.
3. RISK OF LOSS: For domestic shipments, the risk of loss or damage to Equipment in transit shall be upon Buyer, with title to Equipment transferring to Buyer at point when the Equipment is at the disposal of the Buyer. For international shipments, risk of loss and damage shall pass to the Buyer at the point when the Equipment is at the disposal of the Buyer. Title shall pass to the Buyer only when MIOX has received payment in full.
4. RELEASE OF OBLIGATION: No payment, whether final or otherwise, shall operate to release Buyer from any obligations arising as a result of this order. Orders cannot be cancelled by Buyer without MIOX written consent, and then only upon terms that will compensate MIOX for lost profits and all costs and expenses (including any engineering and/or fabrications charges) applicable to the cancelled order.
5. INDEMNITY: Buyer shall defend and indemnify MIOX against all damages, liabilities, claims, losses, and expenses (including, without limitation, reasonable attorney's fees) arising out of or resulting in any way from any act or omission of Buyer, its agents, employees or subcontractors.
6. BUYER'S INSOLVENCY: If Buyer becomes bankrupt or insolvent, or if a petition in bankruptcy or insolvency is filed against Buyer, or if a receiver, trustee, or assignee for the benefit of creditors is appointed for Buyer, MIOX shall have the right, at its sole election, to treat such occurrence as a breach hereof.
7. REMEDIES: In the event of a breach of any one or more of the provisions of this order, MIOX shall have all the rights available to it at law and equity including, but not limited to, (a) to retain any money paid up to an amount which MIOX determines is adequate to cover all damages resulting from Buyer's breach, (b) to assert any claim for damages and any expenses whatsoever, including, without limitation, reasonable attorney's fees, which may be incurred by MIOX by reason of such breach, and (c) to terminate this order immediately upon written notice to Buyer. Such rights shall be in addition to any other remedies provided herein or provided by law or in equity, such remedies to be cumulative and not alternative.
8. PROPRIETARY INFORMATION: Any specifications, drawings, designs, manufacturing data or other information that may be transmitted to Buyer by MIOX in connection with this order are the property of MIOX and are disclosed in confidence upon the condition that they are not to be reproduced or copied or used in furnishing information or equipment to others, or for any purpose detrimental to the interest of MIOX. MIOX shall retain or be entitled to assignment of all intellectual property rights (including copyrights, trademark rights, patent rights, trade secret rights and mask work rights) in any items, features, adaptations, or modifications of Equipment.
9. WAIVER: No waiver by MIOX of any conditions appearing herein shall be deemed to constitute a waiver of any other conditions with regard to subsequent transactions or subsequent parts of the same transaction. No waiver of a breach of any provision of this order shall constitute a waiver of any other breach or of such provisions.
10. FORCE MAJEURE: In the event of a disruption of MIOX business in whole or in part by reason of governmental actions, acts of God, fires, strikes, floods, storms, earthquakes, epidemics, quarantines, wars, insurrections, riots, strikes, acts of civil or military authorities, transportation embargoes, shortages, wrecks, severe weather, labor shortages, computer viruses, other malware, or crashes, Buyer acts or omissions, deliveries of components and materials, or delays by MIOX suppliers, or other causes beyond MIOX's control, MIOX shall have the option of canceling delivered orders in whole or in part. If cancelled by MIOX, any deposits made in conjunction with such order shall be refunded in full to Buyer. Such cancellation shall not constitute a breach of these Terms and Conditions.
11. LICENSE: Subject to the terms and conditions provided in this Agreement, MIOX hereby grants to Customer a nonexclusive, non-sublicenseable, non-transferable license to use all patents, designs, trade secrets, copyrights, or trademarks applying to all Equipment manufactured by MIOX or its contractors either in whole or in part to the Buyer's specifications.
12. TERMS OF PAYMENT: Buyer shall be responsible for payment to MIOX, in full, of the amount invoiced, by pre-payment, or C.O.D., unless credit terms are agreed to in writing and signed by MIOX prior to shipment. If MIOX has granted credit terms to in writing and signed by MIOX prior to shipment.
If MIOX has granted credit terms to the Buyer, all payments must be made on or before the stipulated date unless otherwise agreed to in writing. Failure to pay on or before said date shall constitute a breach of this order,
12 (continued), and MIOX may in addition to all other remedies;
   a. Require Buyer pay interest at a rate of 18% per annum, or at the maximum legal rate if lower.
   b. Suspend any further or other deliveries under any contact with Buyer.

MIOX reserves the right to change terms of payment and discontinue further shipments without prejudice to any other lawful remedy until past due payments are made, or if MIOX, in its sole discretion, deems Buyer to be non-credit worthy. MIOX prices for the Equipment are exclusive of all sales, use, excise and similar taxes and duties and any such taxes and duties shall be the sole responsibility of Buyer.
13. RETURNS: No Equipment will be accepted for return without the prior written approval of MIOX. Buyer shall pay a restocking fee equal to twenty-five percent (25%) of the purchase price for any Equipment accepted for return.
14. INSPECTION AND DEFICIENT PARTS: All inspection or re-inspection performed by Buyer is at Buyer's own expense. Claims for defective material or workmanship, or for missing material, must be submitted to MIOX within fourteen days of receipt of Equipment by Buyer, and must be verified by an authorized agent of MIOX. In such cases, MIOX liability is limited to the replacement or repair of such part or parts as MIOX may decide. Shipping of parts returned as deficient shall be done at Buyer's expense
15. HEADINGS: Headings are inserted for convenience only. In the event any provision of these Terms and Conditions is not enforceable, such unenforceability does not affect the remainder of this order, as the remainder of this order shall remain in full force and effect.
16. APPLICABLE LAW: These Terms and Conditions shall be governed by and shall be construed according to the laws of the State of New Mexico.
17. WARRANTY: MIOX warrants that the MIOX Products when properly installed and operated in accordance with MIOX Products' Operation Manual, will work in accordance with the Technical Specifications and any other specifications defined in the Agreement. This warranty is non-transferrable.
MIOX warrants the MIOX Products against any defects in design, workmanship or material in accordance with the following conditions:
Any defective MIOX Products ("the Defective Product") will be repaired or replaced by MIOX in accordance with the following warranty conditions:
The warranty period varies based on the item and product and is as follows:
   a) All On-Site Generator Enclosures will be warranted for two (2) years starting from the date of shipment from MIOX. Only for the RIO Zuni, the integrated brine tank is considered a part of the enclosure.
   b) All Cells excluding the RIO Zuni Cells will be warranted for five (5) years starting from the date of shipment from MIOX. The RIO Zuni Cell is warrantied for two (2) years starting from the date of shipment from MIOX.
   c) Peripherals and MIOX Products Spare Parts (excluding Cells) will be warranted for one (1) year from the date of shipment from MIOX or by the supplying manufacturer's warranty, whichever is greater.

The warranty shall be void if the MIOX Products, Peripherals or MIOX Products Spare Parts:
   d) have been modified without the express written authorization of MIOX; or
   e) have been damaged, improperly used or subjected to an adverse operating environment, outside of their intended uses and/or environment; or
   f) are repaired or modified by anyone other than MIOX approved personnel; or
   g) have been used in a manner contrary to the MIOX Products Operation Manual or other written instructions provided by MIOX, including but not limited to performing below specification or damaged due to contamination caused by, but not limited to, calcium, manganese, magnesium and insolubles.

THIS WARRANTY IS EXPRESSLY IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OR MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, AND/OR ANY OTHER OBLIGATION OR LIABILITY ON THE PART OF MIOX. The sole and exclusive remedy for breach of any warranty, express or implied, and the only obligation of MIOX thereunder, shall be the repair or replacement of defective products or, at MIOX's sole option, refund of the purchase price or substitution with a new replacement product. MIOX shall in no way be responsible for any consequential damages, of any kind or nature whatsoever, resulting from the breach of any warranty, express or implied.
18. LIMITATION OF LIABILITY. IN NO EVENT SHALL THE LIABILITY OF MIOX HEREUNDER, WHETHER FOR BREACH OF WARRANTY OR CONTRACT, TORT (INCLUDING NEGLIGENCE), PATENT, COPYRIGHT OR OTHER INFRINGEMENT OR OTHERWISE, EXCEED THE PURCHASE PRICE OF THE EQUIPMENT OR PART OR COMPONENT THEREOF WHICH ALLEGEDLY CAUSED THE DAMAGE. IN NO EVENT SHALL MIOX HAVE ANY LIABILITY FOR SPECIAL, INDIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES.
19. NON-ASSIGNMENT. Buyer shall not assign any of its rights or obligations hereunder.
20. ENTIRE AGREEMENT. These Terms and Conditions, the provisions on the face hereof and any other documents incorporated by reference on the face hereof are the sole and exclusive statement of the agreement between the parties concerning the purchase and sale of the Equipment and supersede any prior agreements, orders, quotations, demonstration, samples, proposals or understandings in connection therewith. These Terms and Conditions may only be amended, modified, waived or revoked by a written instrument executed by both parties hereto.

1.0 INTRODUCTION

1.1 Background

The mid-plume pump and treat system is part of an interim remedial measure for the Bulk Fuels Facility (BFF) groundwater plume at Kirtland AFB. The mid-plume groundwater is currently contaminated with ethylene dibromide (EDB) at concentrations above the maximum contaminant level (MCL) of 0.05 µg/L. The mid-plume pump and treat system will eventually consist of several extraction wells that are expected to produce up to 800 gpm of groundwater. Currently three groundwater extraction wells and one groundwater treatment (GWT) system designed for 400 gpm of groundwater are in operations. A second GWT system also designed for 400 gallons per minute (gpm) of groundwater is currently under construction.

Groundwater from the extraction wells is pumped from the wells through buried pipelines into the GWT system feed tanks, one for each GWT system. Groundwater is then pumped from the feed tank through bag-filters for pretreatment, and activated carbon adsorbers which remove the EDB. The treated water from the carbon adsorbers is collected in a discharge tank and then pumped to either the golf course irrigation pond or an injection well for disposal.

Shortly after startup of the first GWT system downhole a corrosion and biofouling issue in the extraction network was identified. Subsequently the biofouling issue made its way to the bag-filters and lead GAC of the first treatment system. An additional pre-treatment system consisting of sand filters installed prior to the existing bag-filters has been proposed to address the biofouling issue.

In addition to addressing biofouling, removal of dissolved iron and manganese may be necessary in the future. Monitoring well results indicate that elevated concentrations of dissolved iron and manganese in the influent water delivered to the GWT system may be expected as additional extraction wells are brought on line.

The sand filters will be pre-fabricated skid mounted units installed with each GWT system. Each unit having flow capacity of 400 gpm will consist of two or more sand filters and include provisions for backwashing of the individual sand filter. Backwash water will be pumped to a Baker-type clarifier tank located outside of the GWT system building. Piping and valves for connection of the additional pre-treatment system to existing pumps and bag filters will be included in the design modifications. Piping and valves necessary to facilitate conveyance of backwash between the outside tanks and both GAC and sand filter units will also be included in the design modifications.

1.2 Objectives

The objectives for these calculations are to determine the appropriate sand filter, pipe sizing and to determine alterations of the existing feed pumps necessary to provide a maximum flow rate from the feed tank, pre-treatment (both sand filters and bag-filters) and GAC to the treated water tank of 400 gpm for each GWT system.

2.0 INPUTS AND ASSUMPTIONS

2.1 Calculation Methodology

Sand filters sizing is based on a loading rate expressed as gpm applied per square foot (ft^2) of filter surface area, i.e., gpm/ft^2. For high pressure rapid sand filters loading rates range from approximately 3 gpm/ ft^2 to 13 gpm/ft^2. The diameter of the sand filter bed has to be large enough so that the pressure drop through the bed is reasonable but not so large that the groundwater flow is too low. As a general practice lower loading rates are used to remove inorganic suspended solids. For the removal of organic material such as biofouling products higher loading rates are acceptable.

The feed pumps for the pre-filters and carbon beds of each GWT system are two identical centrifugal pumps sized for 200 gpm each. The flow from the pumps is controlled by a variable frequency drive (VFD) controlling the speed of the pumps. The system process piping for each GWT was designed by CB&I Federal Services LLC (CB&I) based on a flow rate of 400 gpm. Design Flow Solutions (DFS), a pipeline modeling software program (Reference 1), was used to calculate the frictional head loss within the process piping. The frictional head loss from the piping and components, equipment head loss, and elevation changes are summed to a resultant head loss for process system. This information was in turn used to size the pumps. This software program can be used to calculate the additional frictional head loss within the process piping with the addition of planned sand filter units. The resultant head loss can be used to determine modifications to the existing pumps to maintain the required flow rate for each GWT system.

2.2 Inputs

Inputs include:

- The groundwater design (maximum) feed rate is 400 gpm to each GWT system. Existing feed pumps consist of two pumps for each GWT system, 200 gpm each pump and operating at total head of 104 ft.
- Groundwater inlet temperature from the extraction wells will be between 55 and 60°F.
- Concentrations of dissolved metals, iron and manganese, are expected to increase.
- Monitor pressure and flow through sand filter units.
- Bed expansion of at least 20 percent at 239 gpm during backwash with duration of four minutes minimum for single media system.
- One sand filter at a time will be backwashed while continuing to process water until the entire unit is clean.
- Backwash water to be directed to Baker-type roll-off container located outside the GWT system building. Effluent from tank returned to sump in building and pumped to Feed Tank 110.

2.3 Assumptions

- Removal of organic biofouling products of primary importance. Removal of inorganic suspended solids of lessor importance with bag-filters following sand filter units. Based on manufacture's recommendation the sand filter units will be designed at maximum loading rate of 13 gpm/ft^2.
- Operation including backwash of each sand filter unit independent from the other.
- Controller PLC for the sand filters to be based on Allen Bradley logic and have Ethernet capability.
- Backwash can be initiated manually, via timer, or when observed pressure is ≤10 psi differential pressure from that of clean filter operation.
- Air activated valves switch operation filter to backwash mode. Air provided by small compressor mounted with each sand filter unit.
- Backwash will be initiated when observed pressure is 10 psi greater than from clean filter operation.
- Backwash rate based on manufacture's recommendations.
- Flow rate of feed pumps will be reduced to match backwash rate when backwash of sand filter units is required.
- Flow to GAC units suspended during backwash cycle.
- Provide oxidation and filtration for removal of dissolved iron and manganese

3.0 RESULTS AND CONCLUSIONS

3.1 Results

At the design flow rate of 400 gpm of groundwater and a design loading rate of 13 gpm/ft^2 filter surface area of 30.8 ft^2 is required (Attachment 1). Two 54-inch diameter filter vessels equal 31.8 ft^2 (Attachment 2). A 60-inch vertical side shell depth multi-media filter is recommended for removal of biofouling products as well as dissolved iron and manganese (Attachment 2).

High levels of dissolved iron and manganese greater than 10 mg/l can be treated by chemical oxidation, using an oxidizing chemical such as chlorine, followed by a sand trap filter to remove the precipitated material. DMI-65, a specialty media manufactured in Australia acts as an oxidation catalyst with immediate oxidation and filtration of the precipitates that has been certified to the US Standard of NSF/ANSI 61 for Drinking Water System Components. DMI-65 is an extremely powerful silica sand based catalytic action water filtration media that is designed for the removal of iron and manganese without the use of potassium permanganate through an Advanced Oxidation Process. The DMI-65 media has been shown to efficiently remove dissolved iron to the almost undetectable levels as low as 0.001 ppm and manganese to 0.001 ppm. Qualitative information about how this media works, its capabilities and limitations are included in Attachment 2. Yardney's IMA-65 Specialty Media is the United States equivalent of the DMI-65 media.

Continuous injection of sodium hypochlorite (liquid bleach) to maintain a 0.1 to 0.3 parts per million (ppm) residual level of chlorine (Attachment 2) promotes the oxidation process. Calculations supporting the design for the injection of sodium hypochlorite solution are included in Attachment 3. Based on these calculations injection of 3 gallons per day of household bleach would be required to maintain chlorine residual of 0.3 ppm.

Frequency of backwash is dependent on the production of biofouling products. At the backwash rate of 239 gpm for Yardney Model IL 5424-2A (Attachment 2) each backwash cycle will expand the filter bed 22 percent (Attachment1) and produce nearly 1,000 gallons of water during four minute backwash cycle. The same backwash rate applies to the Yardney Model IL 5460-2A (Attachment 2). One sand filter at a time will be backwashed while continuing to process water until the entire unit is clean (Attachment 3). Backwash effluent from each sand filter unit is conveyed by 4-inch diameter pipe and join with 6-inch diameter pipe to exit the building and discharge to Baker-style settling/clarifier (Attachment 4).

The 120V Allen Bradley Micrologix 1400 PLC Controller (Ethernet compatible) integrated with either Yardney model sand filter requires 120V/<1 A service. The Yardney IL 5424-2A and IL 5460-2A Filter Units each include a 1HP 3 gallon oil lube air compressor to control backwash valve operation and require 120V/15A service.

The groundwater treatment feed pump units for each GWT system will be required to pump 200 gpm each (400 gpm total). Based on modeling the hydraulic performance of the process piping system with dirty sand filters, dirty bag filters, and allowing for fouling/blinding across carbon vessels, a worst case condition, the required head is 120.59 ft wg. With a 20% design margin, per UFC 3-280-01A (Reference 2), the required head is 144.71 ft wg (Attachment 5). Currently each feed pump unit has two Gould model 3196 2x3-6 pumps with impeller diameter of 5.375 inches. The existing pumps will not achieve 200 gpm pumping at head of 144.71 ft wg.

Changing impeller diameter of this pump to 6.062 inches can achieve 200 gpm at total head of 148.9 ft wg. (Attachment 6).

3.2 Conclusions

Two 54 inch diameter sand filter units having 24 inch vertical sides meets the design criteria for removing biofouling products. Two 54 inch diameter multi-media sand filter units having 60 inch vertical sides with crushed gravel, garnet, and IMA-65 media meets the design criteria for removing biofouling products and dissolved iron and manganese. Small chorine injection units as used for residential purposes will provide the required sodium hypochlorite injection rates. Units selected should provide solution storage of at least 15 gallons (5 day capacity). Example systems are included in Attachment 3.

A 40 cubic yard roll-off settling/clarifier has capacity of 8,000 gallons, i.e., eight backwash cycles (Attachment 4).

Changing the impellers of the existing pumps to 6.062 inch diameter will exceed the 20% design margin criteria per UFC 3-280-01A.

Yardney Industrial Sand Filter Specifications

yardney
WATER FILTRATION SYSTEMS

Sand Media Filters

Removal of Solids Down to 20 Microns

Yardney Sand Media filters are designed for the most challenging dirty water conditions with a high performance solution for water filtration down to 20 microns. These durable carbon steel filters utilize a 24" vertical side shell depth for removal of organic and inorganic suspended solids for filtering large volumes of water with very little pressure drop and a long-term value. All Yardney industrial media filters utilize our simple backwash system for ease of operation and consistent water quality. The Yardney automatically controlled filter systems operate for extended periods of time prior to a short backwash cycle.

Applications

- Removal of organic and/or inorganic suspended solids down to 20 microns
- Storm water runoff, industrial process water, incoming plant water, waste water clean-up, industrial water for plant reuse
- Pre-filtration in applications such as granular activated carbon, reverse osmosis, cartridge or bag filtration and deionized water
- 80 psi standard operating pressure (high pressure systems available)
- Flow ranges from 10 gpm and up

Advantages

- State of the art fabrication provides added strength under pressure and long system life
- ASME code shaped head construction for durability and safety
- Stainless steel wedgewire underdrain
  - ➤ Ensures structural integrity in the harshest conditions
  - ➤ Hydraulically balanced to increase effectiveness of backwash while reducing flush frequency and waste of water
  - ➤ High strength stainless steel wedgewire will withstand a collapse pressure in excess of 600 psi
- Standard carbon steel products - 3/16" thick material
- Backwash automatically initiated by elapsed time or pressure differential
- Yardney easy-entry lid closure with weld tabs for operator safety
- Available in welded carbon steel
- 3M Scotchkote® 134 fusion bonded epoxy coating on interior surfaces
- Made in USA

Standard product includes:

- Completely assembled for easy installation
- Skid mounted tanks
- Yardney easy-entry lid closure with side manway
- Valves
- Inlet/outlet and backwash manifolds
- Controller, solenoids, electrical wire, tubing
- Removable underdrain
- 3M Scotchkote® 134 fusion bonded epoxy coating on interior surfaces

Available options:

- ASME code
- High pressure
- Solar package
- PLC controller
- Custom filter station layout piping
- Air scour

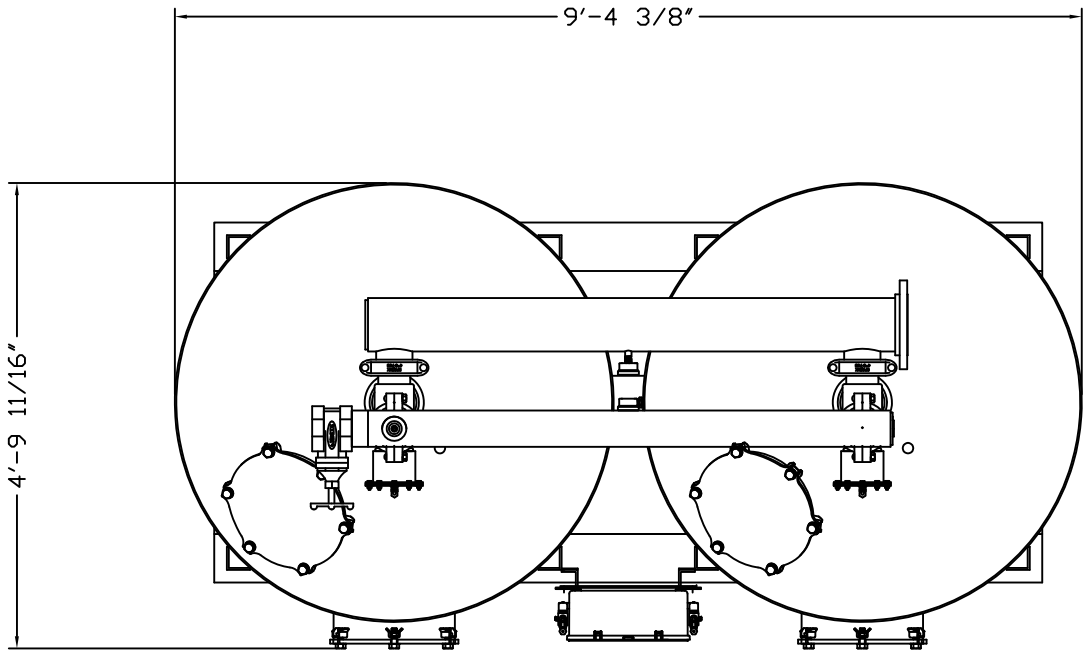
MULTIPLE TANK FILTRATION PROCESS | SAND MEDIA

Media filtration is the most effective method for removal of suspended organic and inorganic solids from water down to 20 microns. Yardney media filters operate on the same basic principle as nature's own ground water filtering process. Contaminated, unfiltered water enters the system through the inlet in the top of the filter and flows, with gravity and under pressure, through the media bed where solid particulates are entrapped. This occurs until the filtration system initiates an automatic backwash to expel all contaminates entrapped within the media bed. Yardney media filters are known for their capacity to extract and hold large amounts of water-borne particulate while continuing to deliver the rated flow of clean water.

FILTRATION PROCESS

- The contaminated water enters the tank through the inlet manifold, transitioning to the Yardney 3-way valve and into the top inlet of each tank
- The Yardney two-stage deflector creates a uniform distribution for laminar flow across the media bed while avoiding channeling of the media bed
- Particulate is trapped and retained within the media bed resulting in clean process water flowing out through the stainless steel wedgewire underdrain, to the outlet of each filter tank and to the outlet manifold for end use

In addition to the Yardney filter's ability to filter large volumes of water with very little pressure drop, one of the outstanding features is the simple backwash operation. This backwashing process is possible due to the highly efficient and hydraulically balanced underdrain systems utilized in Yardney media filters.



BACKWASH PROCESS

- Backwash sequence is initiated by either elapsed time of the Yardney controller or pressure differential between the inlet and outlet manifolds
- Water or air pressure opens the Yardney 3-way valve causing the reverse flow of a portion of filtered water up through the stainless steel underdrain to hydraulically and uniformly lift the media bed
- The use of a hydraulically balanced underdrain in conjunction with a gravel pack creates a proper and uniform lift of the media bed while avoiding a turbulent backwash
- Entrapped particulates are released during the backwash event, exhausted through the backwash manifold and routed to a convenient location
- One tank at a time is backwashed while continuing to process water for use until the entire system is clean
- Once completed with the backwash, filtration continues until the next backwash event is called for

WATER FILTRATION SYSTEMS

Multi-Media Filters

Removal of Solids Down to 5 Microns

Yardney Multi-Media filters are designed for enhanced water quality filtration for the removal of organic and inorganic suspended solids down to 5 microns. Multi-Media filters may be used as a stand-alone system or in conjunction with or as a pretreatment for other filtration technologies. The Multi-Media Filtration Systems utilize a vertical side shell depth of 60" with accompanied reverse stacked medias for progressive filtration through the filtration system. All Yardney industrial media filters utilize our simple backwash system for ease of operation and consistent water quality.

Applications

- Removal of organic and/or inorganic suspended solids down to 5 microns with enhanced solids capacity vs. single media sand filtration
- Storm water runoff, industrial process water, incoming plant water, waste water clean-up, industrial water for plant reuse
- Pre-filtration in applications such as granular activated carbon, reverse osmosis, cartridge or bag filtration and deionized water
- 80 psi standard operating pressure (high pressure systems available)
- Flow ranges from 10 gpm

Advantages

- State of the art fabrication provides added strength under pressure and long system life
- ASME code shaped head construction for durability and safety
- Stainless steel wedgewire underdrain
  - ➤ Ensures structural integrity in the harshest conditions
  - ➤ Hydraulically balanced to increase effectiveness of backwash while reducing flush frequency and waste of water
  - ➤ High strength stainless steel wedgewire will withstand a collapse pressure in excess of 600 psi
- Standard carbon steel products, 3/16" thick material
- Backwash automatically initiated by elapsed time or pressure differential
- Yardney easy-entry lid closure with weld tabs for operator safety
- Available in welded carbon steel or stainless steel
- 3M Scotchkote® 134 fusion bonded epoxy coating on interior surfaces
- Made in USA

Standard product includes:

- Completely assembled for easy installation
- Skid mounted tanks
- Yardney easy-entry lid closure with side manway
- Valves
- Inlet/outlet and backwash manifolds
- Controller, solenoids, electrical wire, tubing
- Removable underdrain
- 3M Scotchkote® 134 fusion bonded epoxy coating on interior surfaces

Available options:

- ASME code
- High pressure
- Solar package
- PLC controller
- Custom filter station layout piping
- Air scour
- Continuous flow
- Rinse to waste

Made in USA

MULTIPLE TANK FILTRATION PROCESS | MULTI-MEDIA

Multi-media filtration is a more effective method for removal of suspended organic and inorganic solids from water down to 5 microns. Yardney Multi-Media filters operate on a similar principle to the sand media but utilize multiple levels of coarse to fine media to achieve progressive filtration through the entire filter media bed. The coarse media within the top section of the tank filters the largest particulates while the finer media beds filter the fine particulates. This occurs until the filtration system initiates an automatic backwash to expel all contaminants entrapped within the media bed. Yardney Multi-Media filters are known for their capacity to extract and hold large amounts of water-borne particulate while continuing to deliver the rated flow of clean water.

FILTRATION PROCESS

- The contaminated water enters the tank through the inlet manifold, transitioning to the Yardney 3-way valve and into the top inlet of each tank
- The Yardney two-stage deflector creates a uniform distribution for laminar flow across the media bed while avoiding channeling of the media bed
- Particulate is trapped and retained within the media bed resulting in clean process water flowing out through the stainless steel wedgewire underdrain, to the outlet of each filter tank and to the outlet manifold for end use

In addition to the Yardney filter's ability to filter large volumes of water with very little pressure drop, one of the outstanding features is the simple backwash operation. This backwashing process is possible due to the highly efficient and hydraulically balanced underdrain systems utilized in Yardney Multi-Media filters. Yardney Multi-Media filters are hydraulically designed not to commingle the multiple levels of media during a backwash cycle due to the specific gravity of each media.

BACKWASH PROCESS

- Backwash sequence is initiated by either elapsed time of the Yardney controller or pressure differential between the inlet and outlet manifolds
- Water or air pressure opens the Yardney 3-way valve causing the reverse flow of a portion of filtered water up through the stainless steel underdrain to hydraulically and uniformly lift the media bed
- The use of a hydraulically balanced underdrain in conjunction with a gravel pack creates a proper and uniform lift of the media bed while avoiding a turbulent backwash
- Entrapped particulates are released during the backwash event, exhausted through the backwash manifold and routed to a convenient location
- One tank at a time is backwashed while continuing to process water for use until the entire system is clean
- Once completed with the backwash, filtration continues until the next backwash event is called for

HOW DMI-65 WORKS

Introduction

The purpose of this paper is to provide users of DMI-65 catalytic water filtration media with qualitative information about how the material works, its capabilities and limitations and enable them to apply the material to water treatment processes in the appropriate manner and with confidence. The paper avoids the detailed complexity of solid surface electrochemical layers and colloidal science, quantitative physical and chemical processes and reactions. For readers having already significant knowledge in this area the paper brings more understanding of what DMI-65 is and its intended use. Newcomers to this area are provided with the bases, and perhaps motivation, for directing their more in depth studies as they might wish.

History

In the early days of water treating, naturally occurring zeolites (such as glauconite greensand) were used to soften and remove the iron and manganese from boiler make-up and process waters. As the demand for higher quality water increased (due in part to higher pressure class boilers) the water treating industry largely moved away from these products for softening to the newly developed synthetic ion exchange resins.

However, in the case of iron and manganese removal this move was much slower and the result was that the use of glauconite greensand (greensand) filtration media continues until the present time. Greensand was and is often used as a pretreatment step prior to ion exchange processes since the iron in a feed water can and does foul the cation resin. Other processes include aeration and oxidation-filtration with standard media filters or proprietary types of media and/or filters

While there have been other iron/manganese removal products and processes developed since greensand was introduced the use of greensand continued even though there were several issues that made it a less than ideal media. It required periodic regeneration with potassium permanganate, could not be used in lower pH waters (<6.2), had a relatively low operating temperature (80^{o}F), and tended to soften through time resulting in pressure drop issues at higher flow rates. Additionally, the supply could occasionally become restricted due to environmental concerns with the processing facilities along the Eastern coast of the United States.

Because of these issues in the 1970s water treating companies and end-users began to express an interest in “something else” to replace the greensand. In response to their requests, scientists and researchers in Japan began to look for ways to infuse oxidizing agents to different matrix materials. It was felt that a commercially produced product could be made more powerful, have better physical properties and be more subject to improvements and/or modifications than any naturally occurring media.

Decades of further research and development of the Japanese Infusion Technology have resulted in the uniquely Australian made product, DMI-65 a granular catalytic media used to boost the advanced reduction/oxidation (redox) processes in water. The media is part of a broad category of products deriving their physical and chemical action from the interaction of their metal oxide surface with the water molecules and ions in solution. This product is revolutionary due to proprietary infusion technology that penetrates the micro pours substrate of the matrix material, allowing for a greater catalytic surface area and of a tight particle size distribution. DMI-65 has low level of fines, a tolerance to wider pH range and chemically infused catalytic surface that won’t be consumed or diminished under normal operating conditions. Last 5 – 10 years of continuous use.

Background information

DMI-65 is an extremely powerful catalytic water filtration media that is designed for the removal of iron and manganese in aqueous solutions (water) without the need for potassium permanganate or chemical regeneration. The unique microporous structure of DMI-65 efficiently removes dissolve iron to the almost undetectable levels as low as 0.001 ppm and manganese to 0.001 ppm. DMI-65 acts as an oxidation catalyst with immediate oxidation and filtration of the insoluble precipitates derived from this oxidation reaction. DMI-65 can also remove Arsenic, Aluminium and other heavy metals and Hydrogen Sulfide under certain conditions.

The material is part of the broad category of products deriving their physical and chemical action from the interaction of their metal oxide surface with the water molecules and ions in solution.

Solid surface interaction with water distinguishes between adsorption as the weak van der Waal forces that hold a hydrophobic molecule in a rigid core media such as activated carbon and absorption as the weak van der Waal forces that hold a hydrophobic molecule in a swellable matrix (such as benzene) in a polymer of T-butyl styrene or absorption by liquid-liquid extraction. Ion exchange resins utilize absorption processes while interaction of DMI-65 with water molecules and ions in solution is initiated through adsorption.

Non catalytic type adsorbent materials retain target ions from water until either sites available for adsorption reach a maximum density and saturation or concentration of target ions in the treated water attain maximum acceptable concentration. At this point, the adsorbent material has to be regenerated to remove or replace the contaminant ions, or the used material is replaced with new material that is loaded in the treatment container. When the process works by swapping one type of ion for target ions from water the process is called ion exchange. This category of adsorbent and some partly absorbent materials remove the target ions from water. The larger the surface per volume of material the larger the amount of contaminant target ions which could be retained from the water.

Purely catalytic materials adsorb the reactant ions from solution bringing them in the proximity of chemical bonding. Then the reaction product moves away from the surface of catalyst. Strictly speaking catalysts facilitate chemical reactions; they do not implicitly remove anything. If the reaction product is a solid precipitate, often the product is retained in the catalytic bed, hence removed by filtration.

Many materials act in a mixed mode; with both ion exchange and catalytic action taking place. For those materials used primarily for their catalytic action, ion exchange resulting in dissolution of the catalytic layer leads to the need for periodic regeneration or reactivation to correct the matrix of ions at their active surface.

DMI-65 – Advanced Oxidation Catalytic Media

DMI-65 is a granular material of dark brown to black colour. This colour is produced by the manganese oxide in the outer layers of the granules. DMI-65 is a catalytic media in the true meaning of the word and facilitates oxidation – precipitation - filtration and does not get consumed in the reactions. Strictly speaking, the media facilitates chemical reactions and does not explicitly remove anything. Once oxidized, the depth filtration aspect of the media removes the solids that are then periodically backwashed out of the filter vessels.

The media does not need regeneration or reactivation and does not display a decaying capacity to do its catalytic work. Over 5 to 10 years period, through many backwashing operations of the bed to remove retained solids, the media is degraded by contact between particles and mechanical abrasion. Then the material has to be replaced.

BASIC OPERATION:

The processes that take place in a bed of DMI-65 involve reduction/oxidation (redox). Redox reactions involve a transfer of electrons between species. Reduction is the gain of electrons or a decrease in the oxidation state of a molecule, atom or ion. Oxidation is the loss of electrons or an increase in the oxidation state of a molecule, atom or ion. Redox reactions occur simultaneously whereby there cannot be a reduction reaction without an oxidation reaction. The media "helps" chemical reactions to occur by interacting with the reaction without being permanently altered. An in depth discussion about redox chemistry is outside the scope of this paper, it will only deal with how the redox process applies in the removal of iron and manganese using DMI-65. The individual redox equations will be covered in the following iron and manganese removal sections.

In order to begin the process of oxidation of the ions in solution and to ensure that the oxidative layer is not compromised the media is designed to operate in the presence of chlorine or other oxidant. In this process the oxidant removes electrons and is consumed in the process. The operator needs to ensure that there is a 0.1 – 0.3 ppm free chlorine residual in the effluent water.

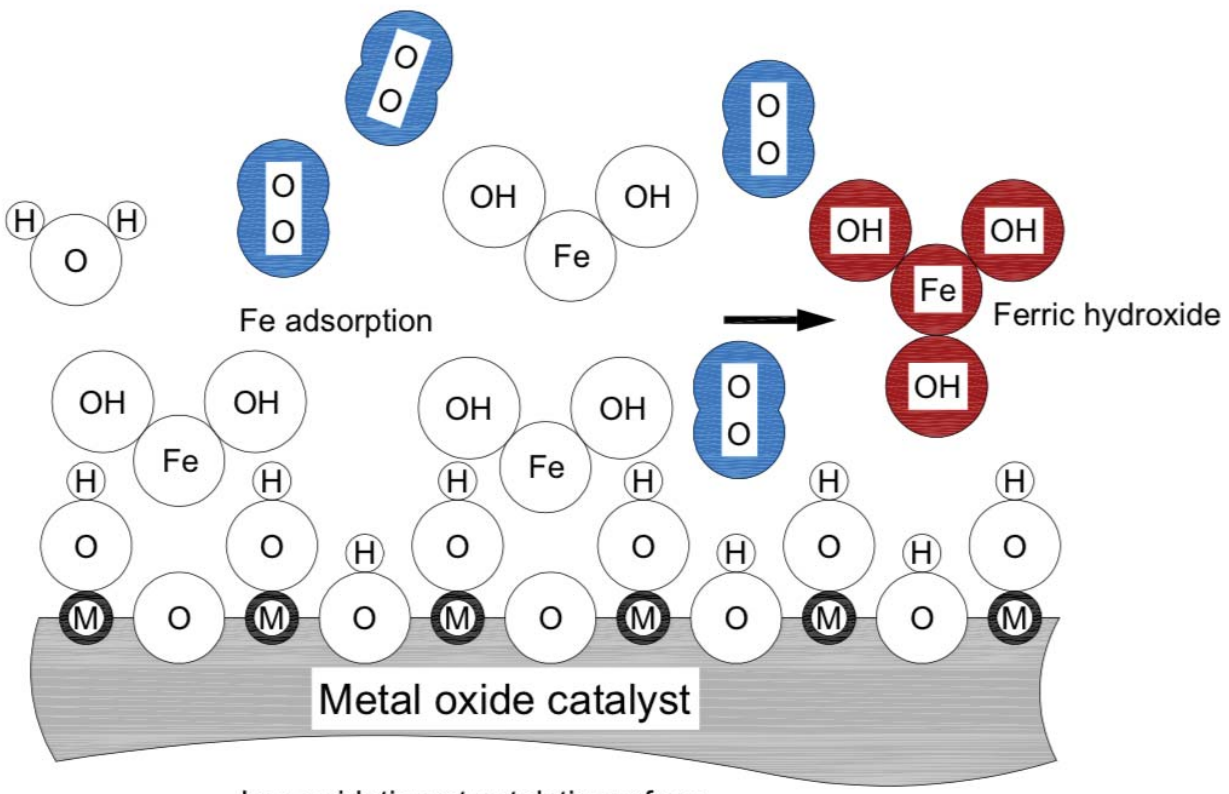
Chlorine, fed as sodium hypochlorite (NaOCl) or bleach (12.5% NaOCl), is the preferred oxidant since it is relatively inexpensive, readily available around the world and it is effective. Other oxidants such as hydrogen peroxide (H_2O_2), chlorine oxide (ClO_2) or ozone can also be used so long as a residual can be measured and maintained.

Another function of the chlorine is that it keeps the media free from bacterial or slime growth. The manganese oxide catalytic surface has to remain clean so that the ions in the water can come in contact with it. At the same time, the chlorine is a source of oxygen more reactive than molecular oxygen. The following chart indicates safe levels for other water constituents that could interfere with the surface interaction.

Unlike ion exchange resins where higher regenerant dosages will increase the ion exchange capacity, chlorine residuals or concentrations higher than required to oxidize the Fe and Mn do not increase the oxidative properties of the media. Additionally, since the media is often used to pretreat waters prior to an Reverse Osmosis (RO) system a higher free chlorine residual would require more extensive post treatment to reduce the residual to protect the membranes from chlorine attack.

The DMI-65 must be activated prior to being placed into service for the first time. This activation requires a higher dosage of chlorine than used during normal operation but only has to be performed once during the initial start up. The dosage rate is 10 fluid ounces of 12.5% chlorine per cubic foot (ft^3) of the media. The activation only requires a soak of several hours but an overnight soak is preferred.

Once activated, the vessel(s) must be backwashed to remove the excess NaOCl and any fines. Since manganese oxide is one of the constituents used in the manufacture of the media an extended rinse is required at start up to remove any trace free manganese oxide residual left over from the



manufacturing process. Once the Mn level in the backwash water reaches values of 0.05 to 0.15 ppm and the free chlorine residual is set the filter is ready to be placed into service.

Media replacement due to the decreased physical filtration properties of the Media due to physical abrasion will occur before complete degradation of the catalytic layer takes place. Under normal operating conditions media life is estimated at 5 – 10 years.

Iron (Fe) precipitation and removal using DMI 65

Iron (Fe) is the fourth most common element found in the earth's crust and exists in a wide range of oxidation states from -2 to +6 although the most common states are ferrous (+2) and ferric (+3).

Ferrous salts are readily soluble. Before the ferrous iron, a dissolved solid commonly found as ferrous bicarbonate, can be removed by filtration it must be oxidized, become ferric hydroxide and in neutral pH waters precipitate out in the media bed. The catalytic surface of DMI-65 contains manganese oxide or exposes manganese and oxygen sites for adsorption of [Fe] ions that are in the water. The reaction of ferrous bicarbonate and NaOCl is almost instantaneous and the ferrous bicarbonate oxidizes (gives up an OH^-) to become the insoluble ferric hydroxide which is then removed through filtration in the catalytic surface of the media. The following redox reaction equation explains the process.

Iron oxidation at catalytic surface.

$$2Fe(HCO_3)_2 + NaOCl + H_2O \rightarrow 2Fe(OH)_2 + 2CO_2 + NaCl$$

In the above figure the catalytic surface is presented in a simplified smooth form. Letter "M" was used to represent a generic metal ion in the lattice of this surface. Letter "O", in the centre of circles, represents an oxygen atom. Various ion size and oxygen molecule (blue) are represented at true relative scale. Except the oxygen molecule, bonded irons are shown as tangent circles. The interpretation for letters and ions in the figure "Ion oxidation at catalytic surface" is:

M: generic metal ion in the catalytic surface lattice (Mn+); n = 1, 2…

O: oxygen atom or ion (O-)

Fe: iron atom or ion (Fe2+, Fe3+)

H: hydrogen atom or ion (H+)

OH: hydroxide, or hydroxyl anion (OH-)

H2O, water molecule shown as tangent circles

Fe (OH)2, ferrous hydroxide is shown as tangent circles

Fe (OH)3, ferric hydroxide, shown as tangent circles, brown colour

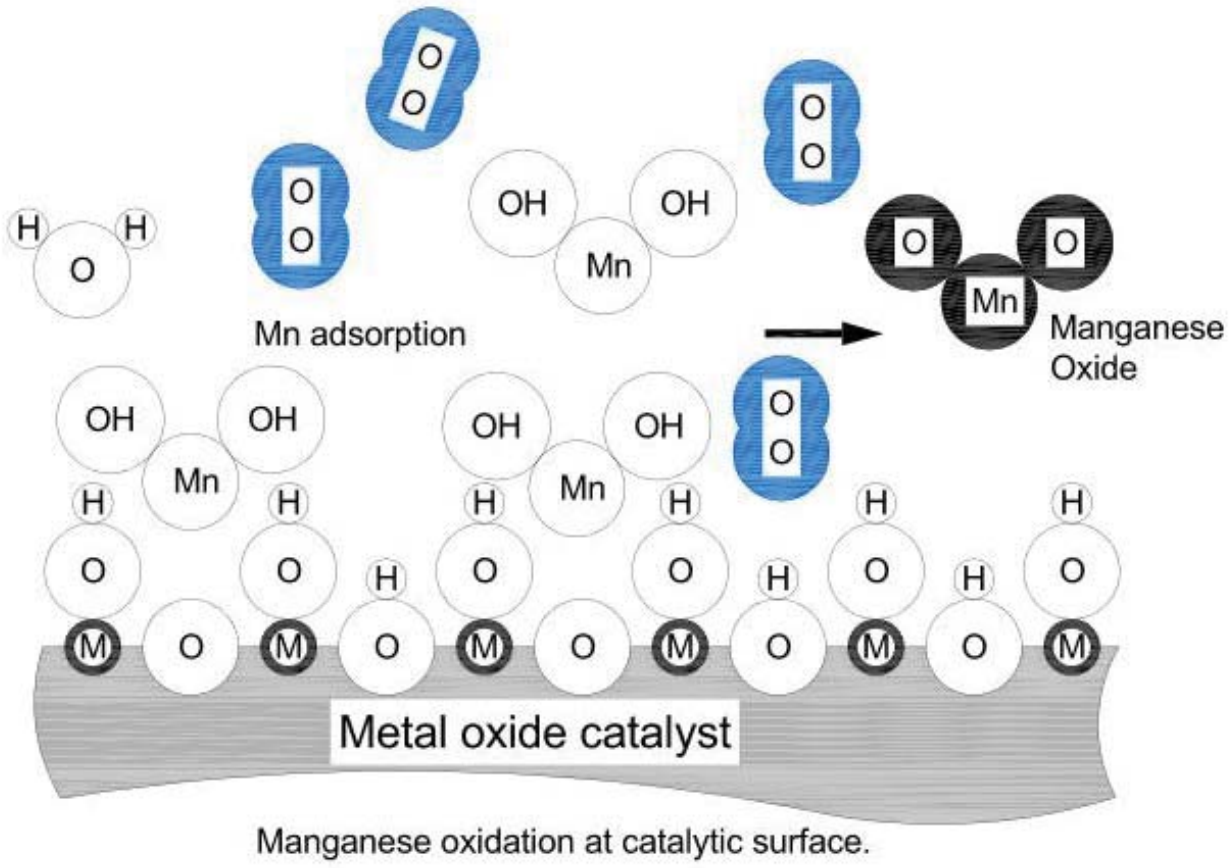
O2, oxygen molecule, atoms shown at covalent bonding distance, blue colour

Dissolved ferrous bicarbonate is attracted with the Fe end towards the lattice oxygen of the catalytic material. This brings the Fe in the proximity of covalent bonding with the hydroxide ion of a neighbouring site and the ferrous bicarbonate changes into insoluble ferric hydroxide which precipitates in crystalline form aggregates of size from 3 nanometre and larger. The aggregates coagulate in larger flocks and are retained in the catalytic bed.

As the ferrous bicarbonate is converted into ferric hydroxide, its concentration at the catalytic surface decreases. In the bulk of the water, away from the catalytic surface, the concentration of ferrous bicarbonate is higher resulting in it diffusing towards the lower concentration according to diffusion law. Diffusion flux is linearly dependent with concentration gradient over distance.

Dissolved oxygen contributes to production of hydroxide ions through direct oxidation of hydrogen in combination with Fe splitting the water molecule and by reacting with the hydrogen at the catalytic surface

It is important to note that although a source of oxygen is needed oxidation and precipitation of Fe is driven by the hydroxide ion. Even under relatively acidic conditions hydroxide ions (a very strong anion) are easier available for binding to Fe than oxygen. Thus, Fe is not very difficult to oxidise and precipitate around neutral pH condition. In addition, concentration of hydroxyl ions increases with pH value exponentially and so does the rate of oxidation and precipitation of Fe.



Chlorine (usually in the form of NaOCl) is a source of oxygen more reactive than molecular oxygen. The ideal residual to be maintained downstream of the catalytic filter is 0.2 mg/l (0.1 to 0.3) free chlorine. A higher residual of free chlorine and therefore higher sodium hypochlorite level in the catalytic filter does not always help. It could have an adverse effect due to venting of chlorine and an increase of competing sodium ions, Na+. The catalytic surface has to be clean so that ions in water could come in contact with it so the chlorine injected also prevents bacteria growth and blinding of the catalytic surface with slime.

info@dmi65.com

Manganese, Mn precipitation and removal using DMI 65

DMI-65 is a catalytic material specifically tailored to the oxidation and removal of manganese. The catalytic surface contains manganese oxide for brining into proximity of covalent bonding manganese and oxygen atoms from water. However, oxidation and removal of manganese (Mn) is vastly different from that of Fe. A major difference is caused by the solubility of manganese oxyhydroxide, $MnO(OH)_2$.

$$Mn(HCO_3)_2 + NaOCl \rightarrow MnO(OH)_2 + NaCl + 2CO_2$$

Manganese oxidation at catalytic surface.

Manganese does not precipitate as oxyhydroxide but as oxide, MnO_2 and higher valency oxides. Presence and concentration of hydroxide anions does not help much in the precipitation and removal of manganese. Manganese hydroxide will be attracted with the manganese end to the oxygen in catalytic lattice surface. An Oxygen molecule has to be available in the proximity for facilitating oxidation through the oxygen from lattice and swapping to the lattice with molecular oxygen. Conditions for this to happen are statistically less probable and reaction is of much slower rate than the oxidation of Fe via hydroxide.

While increases in pH to alkaline levels facilitates oxidation and removal of manganese, under these conditions the oxidised manganese could also dissolve back into the water. Consequently, regardless of the target contaminant to be removed, anoxic conditions have always to be avoided to protect the catalytic layer against leaching into water. When oxidising manganese the recommended pH is close to 8.

Manganese oxide has good autocatalytic effect. When backwashing it is better to stop the process before the water becomes very clear. Manganese oxide residue in the filter bed will enhance manganese oxidation.

info@dmi65.com

Key DMI-65 operating conditions

Treatment processes have to be conducted in such manner so that the catalytic surface of the material is kept clean and available to ion from water to contact.

Water with a large amount of suspended solids has to be clarified before passing it through the catalytic filter with DMI-65. Acceptable levels of suspended solids depends on their nature. A larger amount of mineral suspended solids than organic suspended solids could be handled.

Bacteria could grow and deposit slime on DMI-65. Thus disinfectant and oxidation conditions have to be maintained.

Water containing clays and large organic molecules may result in deposition of such material on the surface of DMI 65 and blinding of the catalytic surface. Treatment for removal of such contaminant before the catalytic filter is needed.

Polymer flocculent could also stick to the DMI-65 and blind catalytic surface.

Hard, unstable groundwater could cause scale deposition in the catalytic filter and blind the material in a solid mono bloc. In such case the DMI-65 material in the bed is lost and would have to be replaced. Treatment for stabilizing the water to prevent scale formation in the catalytic filter has to be carried out.

Both low acidic pH and anoxic conditions could cause dissolution of manganese from catalytic layer of DMI-65 and loss of its capacity. Excessively high pH means excessive concentration of hydroxyl ions (corrosive to metals) and could also cause dissolution of manganese from the catalytic layer.

Do not use demineralized water, distilled water or water known to be strongly corrosive to metals for initial soaking and activation of DMI-65.

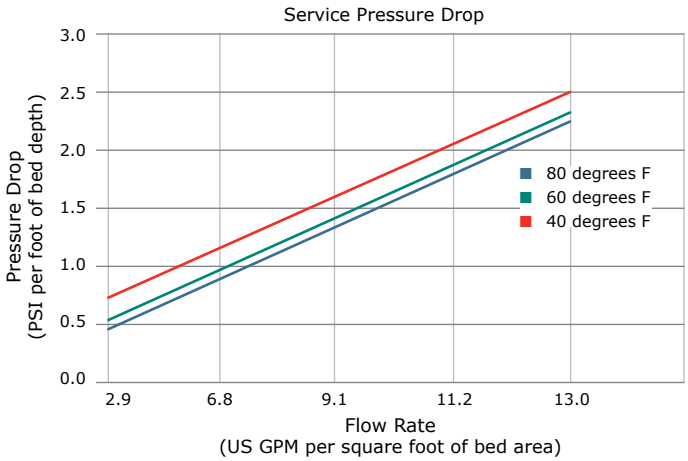
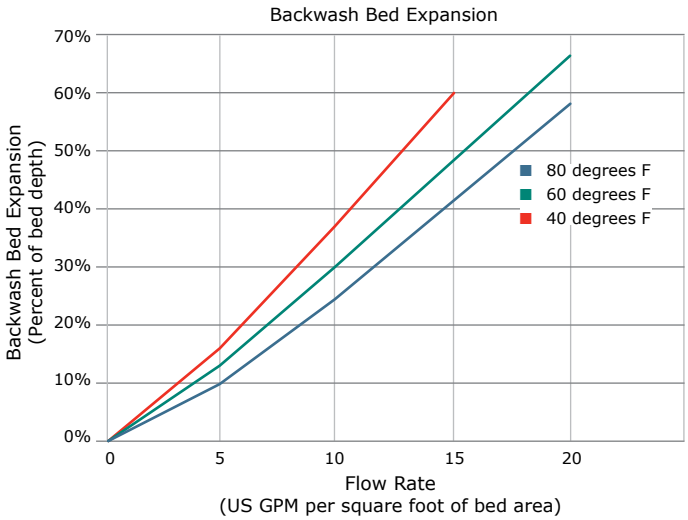
WATER FILTRATION SYSTEMS

IMA-65 Specialty Media

Iron and Manganese Removal

IMA-65 Specialty Media is a revolutionary silica sand based filtration media designed for the removal of iron and manganese without the use of potassium permanganate. The unique micro porous structure of IMA-65 efficiently removes dissolved iron to as low as 0.005 ppm and manganese to 0.001 ppm. After initial activation, the IMA-65 acts as an oxidation catalyst with immediate oxidation and filtration of the insoluble precipitates. The media has been used extensively in a wide variety of applications in Japan for over 30 years. IMA-65 has been tested and certified by the Water Quality Association in accordance with NSF/ANSI 61.





Advantages

- **Eliminates Potassium Permanganate.** Operates with continuous injection of sodium hypochlorite at low residual levels (0.1 to 0.3 ppm).
- **Wide pH range.** Stable and satisfactory performance at pH 5.8 to 8.6.
- **High Flow Rates.** IMA-65 can operate at linear filtration velocities up to twice that of conventional media with a corresponding reduction in capital equipment costs.
- **Higher Operating Temperatures.** Maximum operating temperature of 113 °F (45 °C).
- **Long Life.** IMA-65 is not consumed in the process, providing considerable advantages over other processes or media.
- **Regeneration Not Required.** After initial activation, only sodium hypochlorite feed is required.
- **System Compatibility.** Physical properties are similar to that of competitive media, allowing conversion to IMA-65 without major hardware modifications.
- **Arsenic Removal.** IMA-65 has been shown to be effective in the removal of arsenic associated with iron-containing influent. If necessary, ferric chloride can be introduced to treat waters with low influent iron levels or to enhance removal when treating waters with high levels of arsenic.

SPECIFICATIONS | IMA-65 SPECIALTY MEDIA

Design Calculations for Chlorine Injection

Configurable Dosing Tank Station

Storing and dosing liquid chemicals

General

Dosing is precision work and one of the main tasks in chemical and process engineering as well as water treatment. Thus dosing requires precise adjustment of the pump and its accessories to the process parameters of the respective application. DIGITAL DOSING™ pumps are delivering an optimal performance in these application fields.

As they are easy to install, DTS dosing tank stations are the first choice in the matter of economic efficiency when adding liquids such as coagulants, disinfectants or neutralising agents to a process in a precise and controlled way.

DTS dosing tank stations are intended for storing and dosing liquids. Many different configurations can be selected flexibly to fulfil various dosing tasks. Due to the use of high-quality materials, DTS dosing tank stations can be employed for diverse dosing liquids. The selection of materials can be adapted via the configuration.

Components and features

- Chemically resistant tank made of UV-stabilised, semitransparent or black polyethylene, in 6 sizes from 60 to 1000 litres, with embossed litre scale and PE screw cover
- PE collecting tray
- Handheld mixer or electric stirrer (230 V, 50 Hz) with level switch for dry-running protection
- Rigid suction lance or foot valve made of PE, with 2-step level switch for dry-running protection, suction line to the dosing pump
- PVC or PP injection unit with G 1/2 process connection
- PE or PVC discharge line (10 m)
- Drain valve
- Filling armature with ball valve (for all tank sizes) or dissolving hopper (from 200 l)
- Multi-function valve
- Prepared for the installation of a dosing pump DDA, DDC, DDE, DMX 221 or DDI 60-10 including necessary assembly material (connectors, click-plate and screws depending on pump type)

Note:
Dosing pumps are not comprised in a standard delivery. They have to be ordered separately.

Applications

- Dosing of biocides and inhibitors into cooling water
- Dosing of lyes and acids for pH regulation
- Dosing of coagulants, such as ferric(II)chloride or ferric(III) chloride, for waste water treatment
- Dosing of hypochlorite
- Dosing of cleaning agents and disinfectants (CIP, cleaning machines)

SMART Digital

Now it’s time to break the barriers of conventional dosing

A new era of dosing technology

Chemistry in water treatment, water and wastewater recycling and disinfection has experienced a huge development during the last years, and this poses a challenge for today’s dosing technology. More and more complex applications require intelligent dosing pumps with new drives or new control and adjustment mechanisms to simplify the operators’ job.

SMART Digital dosing pumps meet these challenges. They offer state-of-the-art drive technology, new dimensions of user-comfort and intelligent flow control. These features ensure extremely reliable, cost-effective and high-precision processes at an optimum price-performance ratio.

Reliable processes ✓
Unique user-friendliness ✓
Simple Plug’n’Play ✓

Designed to save costs and to protect the environment

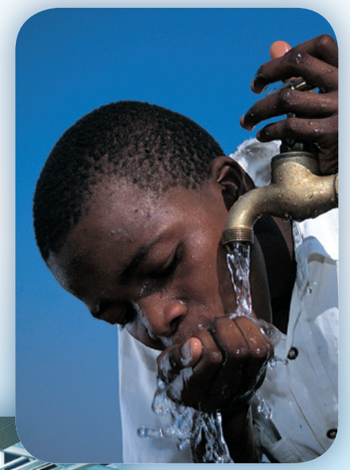
In general, the investment for a dosing pump installation is low compared to its life cycle costs. Low operation costs and longer maintenance intervals combined with an extremely high dosing accuracy make SMART Digital the perfect partner for:

- Saving chemicals with high dosing accuracy and FlowControll
- Saving energy with latest drive technology and improved electronics
- Saving maintenance costs thanks to the universal chemical resistance of the full-PTFE diaphragm and Digital DosingTM
- Saving natural resources with new composite materials and sustainable production processes

Optimal cost control ✓
Environment-friendly ✓

Processes

SMART Digital can be used in a wide range of processes...



- Disinfection
- pH-adjustment
- Chemical dosing
- Cleaning-in-place
- Biocides
- Coagulation
- Precipitation/Flocculation
- Filtration
- Reverse osmosis

Application areas

... within a vast field of application areas:

- Ground water
- Surface water
- Drinking water
- Process water
- Recreational water
- Recycle & reuse

SMART Digital
The perfect system

Simplicity

Precise and easy setup. Intuitive user interface. Simple handling and perfect overview and control even from the distance – it's always easy to handle our SMART Digital!

- Intuitive and self-explanatory menu
- Click wheel (turn-and-push knob)
- Big graphical LCD with four colour "traffic light" concept
- More than 25 languages

Intelligent and intuitive handling saves time and cost – ensuring a seamless integration in all workflows ✓

Modularity

Requirements change, demands grow, and capacities vary – **SMART Digital fits into every environment and situation!**

- Turn-down ratio up to 1:3000 with a dosing spectrum of 0.0025 – 30 l per hour
- Click-stop mounting plate for quick and variable installation
- Control cube can be positioned in three ways (left, right, front)
- Using switch-mode power supply, the SMART Digital model DDA is independent from regional voltages

Highest performance in all operating conditions and a flexible concept you can always rely on ✓

MODULARITY
SIMPLICITY
FLOW INTELLIGENCE

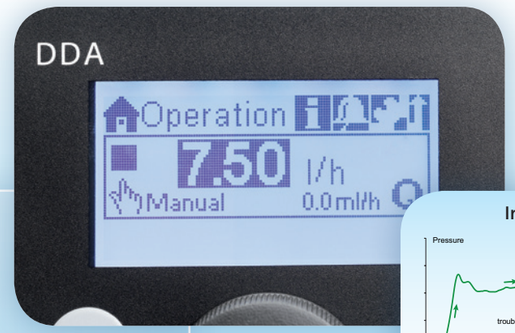
SMART Digital
High performance is our standard

Flow Intelligence

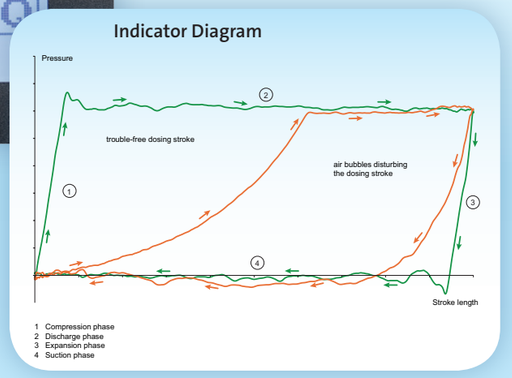
Full control under all conditions. Highest process reliability – at any time with SMART Digital!

- FlowControl with selective fault diagnosis
- Pressure monitoring
- Flow measurement
- AutoFlowAdapt

Groundbreaking flow intelligence guarantees highest process reliability ✓

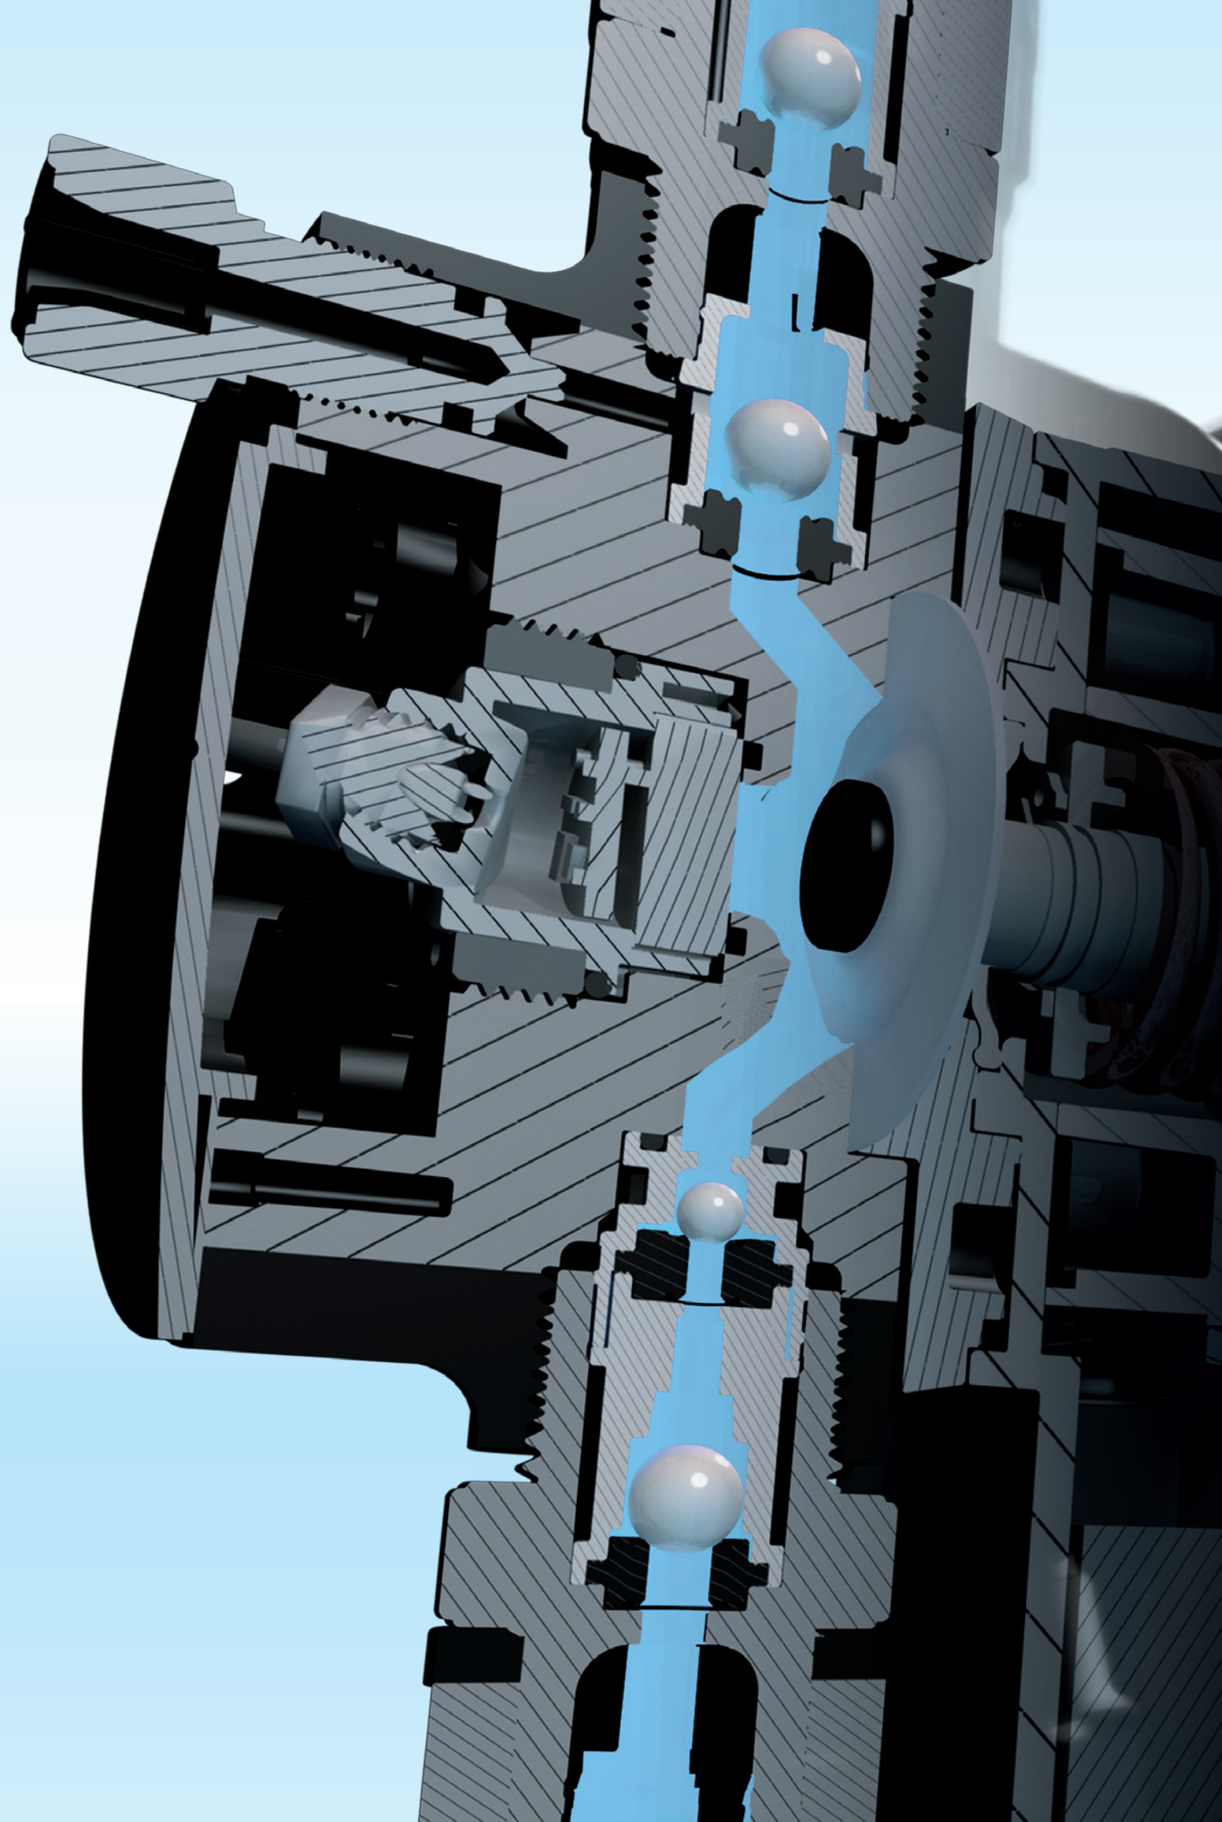


Digital Dosing™



The SMART Digital generation DDA, DDC and DDE with powerful variable-speed stepper motors brings state-of-the-art technology to perfection.

Combined expert knowledge and the new patented solutions set future standards. Traditional technologies such as stroke length/stroke frequency adjustment with synchronous motor or solenoid drive become a thing of the past.



- Powerful variable-speed stepper motor
- Internal stroke speed control
- Turn-down ratio up to 1:3000
- Always full stroke length – even at small flow rates
- Smooth, continuous dosing
- Optimal for degassing liquids
- SlowMode function for high-viscosity liquids

New patented solutions set future standards ✓

MODULARITY
SIMPLICITY
FLOW INTELLIGENCE

SMART Digital DDA, DDC, DDE

Perfect solutions for vast market segments

DDA

This high-end DDA pump range is designed for complex and demanding applications. Whether degassing liquids, flow rates down to 2.5 ml/h or advanced process control are required, this pump offers the perfect solution:

- Max. 30 l/h and 16 bar
- Turn-down ratio 1:3000 (7.5-16) or 1:1000
- FlowControl with selective fault diagnosis
- Integrated flow measurement
- AutoFlowAdapt
- Auto deaeration also during pump standby
- Batch modes (timer- or pulse-based)
- Optional E-box for Profibus DP integration

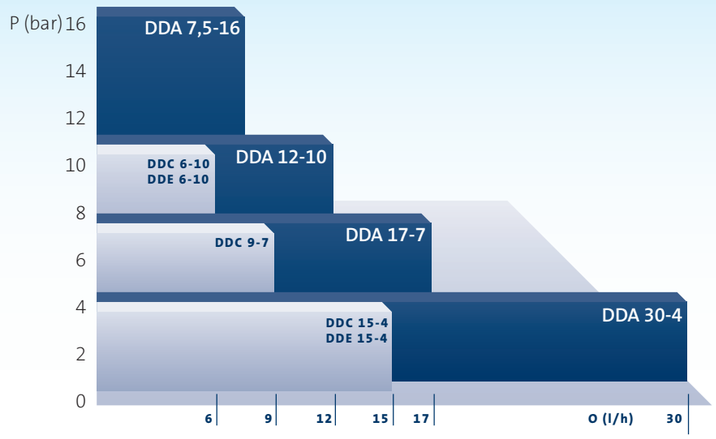
Please see next page for further details.

DDC

The DDC pump range is the optimum solution for common applications. The easy-to-use interface with the click wheel makes the setup and operation as easy as your car radio system:

- Max. 15 l/h and 10 bar
- Turn-down ratio 1:1000
- Graphical LC display backlit in different colours
- More than 25 languages
- Standard operation modes, e.g. pulse and analog
- SlowMode for high viscosity liquids
- 2 integrated relay outputs

Please see next page for further details.



DDE

The DDE offers Digital Dosing with basic functions even for a low budget for easier applications. Now just 2 pump models cover a range where 12 or more were needed in the past:

- Max. 15 l/h and 10 bar
- Turn-down ratio 1:1000
- Smooth continuous dosing
- Always 100 % suction stroke
- Capacity setting 0.1-100 %
- Simple pulse operation mode
- External stop and empty tank alarm

Please see next page for further details.

SMART Digital
Accessories and Service

E-Box Profibus DP

With the additional E-Box module, the pump can be easily integrated in a Profibus DP network. This enables remote monitoring and setting via the fieldbus system. Just click the E-box in between the DDA pump and the mounting plate. With the plug and play solution, DDA pumps can also be easily retrofitted.

General pump accessories

A wide range of accessories is available for the SMART DIGITAL pump range, among others:

- Installation kit including foot valve, injection unit and hose
- Multi-function valve (PVDF)
- Rigid suction lance (PE, PVDF) with low level and empty tank signal
- Foot valve for flexible suction line (PE, PVDF, stainless steel)
- Injection unit (PP, PVC, PVDF, stainless steel) in different designs
- Hose in PVC, PE, ETFE in different sizes
- Signal cables for all inputs and outputs
- Dosing tanks in different sizes

All components have been especially designed for and adjusted to the new SMART Digital pumps.

Only original SMART accessories can guarantee optimum dosing results.

Service

The following service kits are obtainable (for PP, PVC, PVDF and stainless steel):

- Complete dosing head kit
- Valves and diaphragm kit
- Valve kit
- Diaphragm kit

Please see service catalogue for further service kits and details.

SMART Digital pumps have outstandingly long maintenance intervals.

Wear and tear parts which have been in contact with the media only have to be replaced after 8000 operating hours (or after two years at the latest).

Shorter intervals might be necessary for highly-abrasive media.

ALL THE INFORMATION YOU NEED IS ONLINE

Grundfos WebCAPS is an online product selection tool, but it offers much more than that. The site compiles all the product-related information you could ever need.

What you can find in WebCAPS

Catalogue – includes all products available in your region, complete with technical information, drawings, descriptions, performance curves, etc.

Literature – find everything from data booklets through installation & operating instructions to product brochures.

Service – the place to find service instructions (including video tutorials), service parts lists, assembly drawings, etc.

Sizing – enter your system requirements for instant recommendations. Includes Life Cycle Cost calculations.

Replacement – enter the make and model of your old pump for an instant replacement recommendation.

CAD drawings – download DXF and DWG files as required.

For offline use, WinCAPS is a CD-ROM version of WebCAPS. Contact Grundfos to order.

GRUNDFOS **WEBCAPS** GRUNDFOS **WINCAPS**

Our new SMART Digital pump family can be flexibly installed in various positions due to its modular construction. With its user-friendly display and menu-structure, the pump is easy to operate. The integrated flow intelligence assures safe and continuous processes, making it an absolutely reliable pump.

On top of that, you save TIME and MONEY when opting for SMART Digital.

You save TIME:

- Easy commissioning and service due to the click-stop mounting plate
- Self-explanatory user-interface, comparable to a car-radio system
- Plain-text display for failure indication: no need
- for time-consuming fault analysis
- Quick commissioning without reading the I/O
- Easy process control thanks to the intelligent flow management functions

You save MONEY:

- No additional installation parts needed due to the click-stop mounting plate
- High accuracy saves chemicals
- The required target flow is always achieved due to the AutoFlowAdapt, FlowControl and flow measurement functions; additional monitoring and control devices are made redundant
- Intelligent flow management prevents expensive process breakdowns

Hydraulic Analysis

Sand Filter Addition – Differential Pressure Model Outputs

The following is a presentation of a differential pressure model of the groundwater treatment system (GWTS) located at Kirtland Air Force Base, New Mexico. The model assumes a flow rate on 400 gallons per minute (gpm) on each individual treatment train. Each individual treatment train are modelled individually and are assumed to be of the same piping make up (lengths of pipe, number of valves, etc.). Table 1 shows the model outputs for an individual treatment train's head loss due to piping and equipment. Equipment refers to the flow meter, sand filter(s), bag filter(s), and granular activated carbon (GAC) vessels. The following is a list of important assumptions:

1. The model assumes that 200 gpm will pass through the parallel sand filters and bag filters uniformly.
2. All piping is assumed to be carrying 400 gpm and the separated sections of 200 gpm pipe are modeled as containing 400 gpm flow (yielding a more conservative estimate) except for the piping in the pump skid branch. The pump skid branch (branch 2) was modeled assuming a flowrate of 200 gpm as this branch does not contain large sections of 400 gpm piping but does contain reducers and enlargers that are largely influenced by flowrate. See Table 1 for the corresponding difference between the 400 and 200 gpm models.

Table 1. Head Loss Totals

	Piping Head Loss at 400 gpm from Influent to Effluent Tanks and 200 gpm from Influent to Clarifier[a] (psi)	Influent Skid Head Loss at 200 gpm from Influent to Effluent Tanks and 100 gpm from Influent to Clarifier[b] (psi)	Equipment Head Loss[c] (psi)	Total Head Loss[d] (psi)	Total Head Loss (ft)
Influent Tank to Effluent Tank	13.5	1.78	37	62.74	144.71
Influent Tank to Clarifier	4.7	0.45	20	30.18	69.61

[a] Piping head loss differs from the model calculations in that the model includes a 3" to 2" nominal reducer (accounting for 10.495 psid at 400 gpm) in branch 2 which is actually incorporated in the pump. Thus the reducer is included in the pump efficiency and has been removed from the piping head loss pressure shown above.
[b] Along the influent skid there is a section where the flow diverges into two separate flows of 200 gpm when the train is operating at a 400 gpm total and 100gpm at a 200 gpm total. The difference in headloss between the 400/200 and 200/100 gpm models are provided above and used to calculate total head loss.
[c] Assumes differential pressure at 400 gpm for the Sand Filter is 10 psi, Bag filter is 15 psi, flow meter is 2 psi, and GAC vessels are 10 psi (totaled for both vessels). When operating in sand filter backwash at 200 gpm, the sand filters account for a total of 20 psi (10 psi each).
[d] Total head loss includes additional 20% safety factor. " = inch(es)
% = percent ft = foot/feet
gpm = gallons per minute
psi = pounds per square inch

Kirtland AFB - Carbon Exchange Procedure

Site Address - 1601 Walker Street Kirtland AFB Albuquerque, NM 87116

VESSEL TO BULK TRUCK:

Assemble hose connections:

- ¾" compressed air to the 4" carbon fill. Chicago fitting is required.
- 4" from the carbon discharge to the truck.
- Connect the 3/4" chase water fitting to the flush connection.
- Add sight glass.

Begin slurry:

- Open carbon fill compressed air supply valve.
- Start compressor pressurizing the tank.
- Open chase water valve to lubricate the carbon discharge hose.
- Open 4" carbon discharge valve and begin the slurry.
- Use sight glass to verify carbon is moving.
- Slurry should take approximately 45 minutes.

Flush the tank (Forward flow) with the tank still under pressure:

- Arrange valves to run treated water from operating tank in to the tank being serviced. Open process influent valve approx. 1/4 open and close in a continuous motion to run water cascading down the tank (Forward Flow) to knock loose residual carbon. Repeat this step approximately 8-10 times or until sight glass runs clear.
- Using clean water connected to carbon fill is also acceptable.

Transfer water from the bulk truck to Frac Tank:

- Connect hose from the drain system of the bulk truck.
- Pressurize trailer until free water is discharged or truck is legal weight.

BULK TRUCK TO VESSEL:

Assemble hose connections:

- 4” from the bulk truck to the carbon fill.
- Connect the 2” chase water fitting to the 2” connection on the truck.
- Add sight glass to the truck connection.

Begin slurry:

- Add water cushion using treated process effluent water to approximately the bottom weld seam or slightly less.
- Open carbon fill valve.
- Start compressor pressurizing the tank.
- Open 2” vent valve.
- Open chase water valve to lubricate the carbon discharge hose.
- Open 2” Drain on vessel effluent to evacuate water.
- Reference operation and maintenance manual for valve chart.
- Use sight glass to verify carbon is moving.
- Slurry should take approximately 45 minutes.

Note:

Open the sample taps on the shell. Watch for water running from the lower tap and shut the valve. Time how long it takes for water to reach the second sample. If the time is less than 4 minutes, the chase water should be backed off slightly. This will help ensure a total carbon transfer without shutdown/draining.

Flooding the tank prior to total carbon transfer will result in shut down of slurry.

If possible, use both 2” drains located on the bottom of the tank and the effluent pipe connecting to the valve rack to evacuate as much water as possible during the slurry.
