DEPARTMENT OF THE AIR FORCE
377TH AIR BASE WING (AFGSC)

18 November 2021

Colonel Jason F. Vattioni, USAF
Commander
377th Air Base Wing
2000 Wyoming Blvd SE
Kirtland AFB NM 87117

Mr. Frederic Shean
Hazardous Waste Bureau (HWB) Chief
New Mexico Environment Department
2905 Rodeo Park Drive East Building 1
Santa Fe NM 87505-6303

Dear Mr. Shean

Attached, please find the *Periodic Monitoring Report for April-June 2021 for the Bulk Fuels Facility, Solid Waste Management Units ST-106/SS-111, Kirtland Air Force Base, New Mexico,* dated November 2021. This report summarizes soil vapor monitoring, groundwater monitoring, and interim measure activities associated with the distal plume capture and treatment system at Solid Waste Management Units ST-106/SS-111.

If you have any questions or concerns, please contact Mr. Ryan Wortman at commercial line (505) 853-3484 or email ryan.wortman.3@us.af.mil.

Sincerely

VATTIONI.JASON.F.1170028640

14. ABSTRACT

This Periodic Monitoring Report was prepared in accordance with Part 6.2.4.4 of the Kirtland Air Force Base (AFB) Resource Conservation and Recovery Act (RCRA) Hazardous Waste Treatment Facility Operating Permit (Permit Number NM9570024423 [RCRA Permit]) (New Mexico Environment Department, 2010). This report describes monitoring activities performed from April 1 through June 30, 2021, at Solid Waste Management Units ST-106/SS-111, the Bulk Fuels Facility site, at Kirtland AFB, New Mexico. During this quarter, soil vapor, groundwater, drinking water from supply wells, and the groundwater treatment system (GWTS) samples were collected and analyzed for contaminants of potential concern, notably 1,2-dibromoethane (ethylene dibromide [EDB]), and other relevant field and laboratory parameters in accordance with the applicable provisions in Part 6.5 of the RCRA Permit. In this quarter, 68,538,600 gallons of groundwater were extracted and treated in the GWTS using a granular activated carbon filtration system; the treated effluent was discharged to the Tijeras Arroyo Golf Course main pond and injection wells KAFB-7 and KAFB-106IN2. During this quarter, the GWTS was operational for 97.9 percent of the time and removed approximately 1.18 grams of EDB. The Q2 2021 performance assessment showed the GWTS had hydraulically captured 97–100 percent of the initial Target Capture Zone dissolved-phase EDB volume and mass. The performance assessment indicated the GWTS had vertically captured 100 percent of the dissolved-phase EDB volume and mass.

15. SUBJECT TERMS

Bulk Fuels Facility, Solid Waste Management Units ST-106/SS-111, ethylene dibromide, 1,2-dibromoethane, EDB, interim measure, RCRA, groundwater sampling, groundwater treatment system operation, granular activated carbon

PREFACE

This Periodic Monitoring Report for April–June 2021 has been prepared by EA Engineering, Science, and Technology, Inc., PBC (EA) for Kirtland Air Force Base (AFB) under the U.S. Army Corps of Engineers Contract Number W912PP-20-C-0020. The report addresses activities at the Kirtland AFB Bulk Fuels Facility, Solid Waste Management Units ST-106/SS-111, located in Albuquerque, New Mexico.

The report contains data collected by EA as well as by other entities/sources that are not under EA's direct control (collectively called "non-EA Data"). All non-EA data reported herein are displayed in the form in which they were received from their source entity, and EA assumes no liability for its accuracy.

This report was prepared in accordance with applicable federal, state, and local laws and regulations, including the New Mexico Hazardous Waste Act, New Mexico Statutes Annotated 1978, New Mexico Hazardous Waste Management Regulations, Resource Conservation and Recovery Act, and regulatory correspondence between the New Mexico Environment Department Hazardous Waste Bureau and the U.S. Air Force, dated March 25 and May 20, 2016. The work presented in this report was conducted in accordance with Kirtland AFB's Hazardous Waste Treatment Facility Operating Permit Number NM9570024423 and the Class V Underground Injection Well Discharge Permit Number 1839, both issued by the New Mexico Environment Department.

Monitoring of soil vapor, groundwater, and drinking water and operation of the groundwater treatment system were conducted from April 1 through June 30, 2021.

EXECUTIVE SUMMARY ES-1
1. INTRODUCTION 1-1
1.1 BACKGROUND 1-1

2. REGULATORY CRITERIA 2-1
2.1 REGULATORY STANDARDS AND PROJECT SCREENING LEVELS 2-1
2.2 REGULATORY CORRESPONDENCE AND RCRA PERMIT REQUIREMENTS 2-2
2.3 ANALYTICAL REPORTING LIMITS 2-2

3. SCOPE OF ACTIVITIES 3-1
3.1 SOIL VAPOR MONITORING 3-1
3.1.1 New Soil Vapor Monitoring Activities 3-2
3.2 GROUNDWATER MONITORING 3-2
3.2.1 New Groundwater Monitoring Activities 3-3
3.3 DRINKING WATER SUPPLY WELL SAMPLING 3-3
3.4 INTERIM MEASURE 3-3
3.5 DATA REVIEW AND USABILITY 3-4
3.5.1 Soil Vapor 3-4
3.5.1.1 Soil Vapor Dilution and Data Usability 3-4
3.5.2 Groundwater 3-5
3.5.3 Drinking Water 3-6
3.5.4 Interim Measure 3-6
3.5.5 Final Data Upload 3-6

4. VADOSE ZONE MONITORING 4-1
4.1 VADOSE ZONE SOIL VAPOR DATA COLLECTION 4-1
4.2 Q2 2021 SOIL VAPOR MONITORING AND CHEMICAL ANALYTICAL DATA RESULTS 4-2
4.2.1 Off-Base Soil Vapor Monitoring Points 4-2
4.2.1.1 Field Monitoring Results 4-2
4.2.1.2 Chemical Analytical Results 4-2
4.2.2 On-Base Soil Vapor Monitoring Points Outside of Source Area 4-3
4.2.2.1 Field Monitoring Results 4-3
4.2.2.2 Chemical Analytical Results 4-3
4.2.3 On-Base Soil Vapor Monitoring Points Inside the Source Area 4-3

4.2.3.1 Field Monitoring Results 4-3
4.2.3.2 Chemical Analytical Results 4-3

4.3 SOIL VAPOR MONITORING WELL NETWORK MAINTENANCE 4-4

5. GROUNDWATER MONITORING 5-1
5.1 MONITORING RESULTS 5-1

5.1.1 Groundwater and Light Non-Aqueous Phase Liquid Gauging 5-1
5.1.2 Groundwater Gauging Monitoring Results 5-1

5.2 GROUNDWATER SAMPLING 5-2

5.2.1 Field Parameter Monitoring Results 5-2

5.3 GROUNDWATER SAMPLES ANALYTICAL RESULTS 5-2

5.3.1 Organic Compounds Analytical Results 5-3

5.3.1.1 EDB Analytical Results 5-3
5.3.1.2 BTEX Analytical Results 5-4

5.3.2 Inorganic Compound Analytical Results 5-4
5.3.3 Sampling Results for U.S. Geological Survey Sentinel Wells 5-5

5.4 GROUNDWATER MONITORING WELL NETWORK MAINTENANCE 5-5

6. DRINKING WATER SUPPLY WELL MONITORING 6-1
6.1 DRINKING WATER SUPPLY WELL ANALYTICAL RESULTS 6-1

7. INTERIM MEASURE OPERATION AND MONITORING 7-1
7.1 GROUNDWATER TREATMENT SYSTEM OPERATION 7-1

7.1.1 Groundwater Treatment System Treatment Volumes and Percentage Run Time 7-1

7.1.1.1 Quarterly Run Time 7-1

7.1.2 Extraction Well Performance Metrics 7-1
7.1.3 Injection Well Performance Metrics 7-2

7.2 GROUNDWATER TREATMENT SYSTEM PERFORMANCE MONITORING 7-2

7.2.1 Sampling and Analytical Results 7-3

7.2.1.1 Influent Sample Results 7-3
7.2.1.2 Effluent Sample Results 7-3
7.2.1.3 Extraction Well Sample Results 7-3

7.3 EDB REMOVAL 7-4

7.4 GROUNDWATER TREATMENT SYSTEM MAINTENANCE AND EXPANSION ACTIVITIES 7-4
7.4.1 Routine Maintenance Activities 7-4
7.4.1.1 Quarterly Routine Maintenance Activities 7-4
7.4.2 Conveyance Line Security and Administrative Controls 7-4
7.4.3 Non-Routine Maintenance Activities 7-5
7.5 PLANNED WORK FOR THE UPCOMING PERFORMANCE PERIOD 7-6
7.6 SUMMARY OF PUBLIC MEETINGS 7-6
8. INVESTIGATION-DERIVED WASTE 8-1
8.1 NON-HAZARDOUS INVESTIGATION-DERIVED WASTE 8-1
8.1.1 Groundwater Monitoring Liquid Investigation-Derived Waste 8-1

VOC	volatile organic compound
WQCC	Water Quality Control Commission

EXECUTIVE SUMMARY

The monitoring and interim measure of the Kirtland Air Force Base (AFB) Bulk Fuels Facility release (Solid Waste Management Units ST-106/SS-111) are being implemented pursuant to the Resource Conservation and Recovery Act (RCRA) corrective action provisions in Part 6 of Kirtland AFB's Hazardous Waste Treatment Facility Operating Permit Number (No.) NM9570024423 [RCRA Permit]) (New Mexico Environment Department [NMED], 2010). This Periodic Monitoring Report was prepared in accordance with Parts 6.2.4.1 and 6.2.4.4 of the RCRA Permit, Class V Underground Injection Well Discharge Permit No. 1839 (NMED, 2017a), and NMED General Reporting Guidelines (NMED, 2020a). This report summarizes the activities performed for the second quarter (Q2) of 2021, from April 1 through June 30. These activities include semiannual soil vapor monitoring, quarterly groundwater monitoring, monthly drinking water supply well sampling, and evaluation of the dissolved-phase 1,2-dibromoethane (ethylene dibromide [EDB]) groundwater pump-and-treat interim measure.

In Q2 2021, 299 soil vapor monitoring wells were sampled. Consistent with previous quarters, the highest EDB, benzene, and hydrocarbon concentrations were detected on Kirtland AFB within the source area at and below the depth of 50 feet (ft) below ground surface. Samples collected from soil vapor monitoring points within the 25-ft horizon were screened against the NMED residential soil gas vapor intrusion screening levels (VISL). Benzene and EDB concentrations were below the respective residential soil gas VISL at all soil vapor monitoring points screened in this horizon both on-Base and off-Base.

In Q2 2021, 167 groundwater monitoring wells were sampled. Consistent with previous quarters, the highest EDB and benzene, toluene, ethylbenzene, and total xylenes (BTEX) concentrations were detected on Kirtland AFB in samples from wells located in the source area. Within the source area plume south of Ridgecrest Drive Southeast (SE), the footprints of the EDB and BTEX plumes have remained stable over time. The plume boundaries are well defined in three dimensions based on samples collected from monitoring wells screened at varying depths across the network.

Sentinel wells are located between the contaminated groundwater plume and nearby production wells owned and operated by Kirtland AFB, the Albuquerque Bernalillo County Water Utility Authority, and the Raymond G. Murphy Veterans Affairs (VA) Medical Center. These wells serve as an early warning system to assess potential contaminant migration toward production wells and were sampled during Q2 2021. Neither EDB nor BTEX were detected in samples collected from the sentinel wells. Additionally, two Kirtland AFB drinking water supply wells (KAFB-003 and KAFB-015) and the VA drinking water supply well (ST106-VA-2) were sampled monthly during Q2 2021. Kirtland AFB drinking water supply well KAFB-016 was only sampled in April since it was down for maintenance in May and June. Neither EDB nor BTEX was detected in the samples collected from these wells.

Depths to groundwater were gauged in 172 groundwater monitoring wells during Q2 2021. Groundwater elevations ranged from 4874.35 to 4877.64 ft above mean sea level, an average of approximately 460 ft below ground surface. Water levels rose an average of 1.25 ft between Q4 2020 and Q2 2021. Light non-aqueous phase liquid (LNAPL) was detected and measured in five of these wells, KAFB-106005, KAFB-106059, KAFB-106076, KAFB-106150-484, and KAFB-106154-484, all of which are located on Kirtland AFB within the source area plume. The location and thickness of LNAPL was consistent with previous measurements, with thickness ranging from 0.01 ft in KAFB-106005, KAFB-106059, and KAFB-106076 to 0.39 ft in KAFB-106150-484. The extent of LNAPL was delineated in Q2 2021 as confirmed by 16 wells whose screens were not submerged (i.e., screens intersected the water table) and did not contain LNAPL.

As part of the groundwater treatment interim measure, groundwater pumped from four extraction wells (KAFB-106228, KAFB-106233, KAFB-106234, and KAFB-106239) located within the dissolved-phase EDB plume was treated at the groundwater treatment system (GWTS) located on Kirtland AFB. GWTS influent during Q2 2021 had concentrations of EDB below the U.S. Environmental Protection Agency Maximum Contaminant Level of 0.05 micrograms per liter, and BTEX was not detected. The influent was filtered through two treatment trains containing granular activated carbon that removed EDB. EDB was not detected in samples collected from the GWTS effluent.

During this quarter, the GWTS ran for 97.9 percent of the time, treated 68,538,600 gallons of groundwater, and removed an estimated 1.18 grams of EDB. The treated groundwater was then pumped to be discharged into the lined main pond at the Kirtland AFB Tijeras Arroyo Golf Course (50,947,000 gallons) or to be gravity-fed into injection wells KAFB-7 (7,267,900 gallons) and KAFB-106IN2 (10,323,700 gallons).

Analysis of the data indicates that the mass of EDB has decreased significantly since the interim measure began in the fourth quarter of 2016. As of April 2021, only 4.8 grams of EDB remain to be remediated within the target capture zone. This means that a 95 percent decrease in plume mass has occurred since the interim measure began operations approximately 4 years ago. In general, the analysis shows that the interim measure has collapsed the EDB plume, with part of the remaining mass of EDB north of Ridgecrest Drive SE being either centered around interim measure extraction well KAFB-106228 or just north of Ridgecrest Drive SE as an extension of the source area plume. Overall, the plume analysis suggests that the GWTS is successfully capturing and removing the dissolved-phase EDB mass.

1. INTRODUCTION

The monitoring and interim measure of the Kirtland Air Force Base (AFB) Bulk Fuels Facility (BFF) release (Solid Waste Management Units [SWMUs] ST-106/SS-111) are being implemented pursuant to the Resource Conservation and Recovery Act (RCRA) corrective action provisions in Part 6 of Kirtland AFB's Hazardous Waste Treatment Facility Operating Permit Number (No.) NM9570024423 [RCRA Permit] (New Mexico Environment Department [NMED], 2010).

This Periodic Monitoring Report was prepared in accordance with Parts 6.2.4.1, Quarterly Reporting, and 6.2.4.4, Periodic Monitoring Reports, of the RCRA Permit and presents data gathered during second quarter (Q2) 2021 operations. The reporting schedule is provided in the Work Plan for BFF Expansion of the Dissolved-Phase Plume Groundwater Treatment System (GWTS) Design (Kirtland AFB, 2017a). Regulatory correspondence is provided in Appendix A-1. Responses to regulatory comments to the Quarterly Monitoring Report for April–June 2019 and the Reporting Requirements for All Document Submittals provided by NMED in a letter dated September 2, 2020 (NMED, 2020a) are provided in Appendix A-2. A crosswalk table between the RCRA Permit reporting requirements and this Periodic Monitoring Report is provided as Appendix A-3.

1.1 Background

The BFF site is located within the northwestern portion of Kirtland AFB, on the southern end of the City of Albuquerque, as shown on the site location map (Figure 1-1). The releases originated from fuel delivery infrastructure at the BFF and were identified by Kirtland AFB personnel in November 1999. The active fueling facility continues operation with aboveground infrastructure with leak detection and containment measures. The BFF site, comprised of SWMUs ST106/SS-111, consists of jet fuel-related constituents in soil, soil vapor, groundwater, and light non-aqueous phase liquid (LNAPL) on-Base, as well as the off-Base migration of jet fuel-related constituents in the groundwater; historically, LNAPL was also present off-Base. The off-Base migration included dissolved-phase 1,2-dibromoethane (ethylene dibromide [EDB]) extending north of Ridgecrest Drive Southeast (SE).

In 2015, an interim measure was implemented to collapse and hydraulically control the EDB plume north of Ridgecrest Drive SE. The current groundwater interim measure includes four groundwater extraction wells located within the Interim Measure Operational Area (IMOA) in the distal portion of the dissolved-phase EDB plume (Figure 1-2). The interim measure is taking place pending final remedy evaluation and implementation.

The Phase I RCRA Facility Investigation (Kirtland AFB, 2018a) provides a detailed description and history of the BFF. Ongoing soil vapor monitoring (SVM), groundwater monitoring (GWM), and the implementation of the groundwater interim measure are discussed in this report.

2. REGULATORY CRITERIA

The monitoring and interim measure of the Kirtland AFB BFF release are being implemented pursuant to the corrective action provisions in Kirtland AFB's RCRA Permit (NMED, 2010). This permit is enforced by NMED's Hazardous Waste Bureau, which is authorized to administer the RCRA Permit by the U.S. Environmental Protection Agency (EPA). The site-specific monitoring and interim measure are conducted in accordance with the approved documents presented in Section 3. Regulatory correspondence for Q2 2021 is provided in Appendix A-1.

2.1 Regulatory Standards and Project Screening Levels

The following regulatory standards and project screening levels are applied to assess the data collected during GWM and the interim measure being conducted at SWMUs ST-106/SS-111:

- For samples collected from GWM wells and samples collected for inorganic compound analysis from drinking water supply wells, concentrations are compared to the project screening levels, which are the cleanup levels for contaminants in groundwater as provided in Part 6.2.3.1 of the RCRA Permit (NMED, 2010):
  - The project screening levels are the lowest of the:
    - New Mexico Water Quality Control Commission (WQCC) standard for Groundwater of 10,000 milligrams per liter [mg/L]) Total Dissolved Solids Concentration or Less (New Mexico Administrative Code [NMAC], Title 20, Chapter 6, Part 2, Section 3103 (20.6.2.3103 NMAC); for metals, the New Mexico WQCC standard applies to dissolved metals and total mercury
    - Current EPA primary drinking water regulations (40 Code of Federal Regulations [CFR] Part 141, 1975) and secondary drinking water regulations (40 CFR Part 143, 1979) adopted by EPA under the Safe Drinking Water Act (42 U.S. Code §300f et seq., 1974)
  - If no federal maximum contaminant level (MCL) or New Mexico WQCC standard exists for an analyte, the project screening level used is the EPA Residential Tap Water Regional Screening Level (EPA, 2021)
- For samples collected monthly from drinking water supply wells for organic compound analysis, concentrations are compared to the primary and secondary drinking water regulations noted above.
- The regulatory project screening levels applied to soil gas samples collected from soil vapor monitoring points (SVMPs) are not defined in the RCRA Permit. As stated in NMED Comment #4 in the comments to the Quarterly Monitoring Report for April–June 2019 (Appendix A-1), dated July 2020 (NMED, 2020b), the Permittee must provide a comparison of detected concentrations to a regulatory standard for the purpose of assessing the presence and location of contaminants of concern. As a consequence, the vapor intrusion screening levels (VISLs) provided in Volume 1 of NMED's Risk Assessment Guidance for Site Investigations and Remediation (NMED, 2019 and as updated) are used for a first-tier screening assessment. NMED VISLs were calculated utilizing attenuation factors applied to EPA's indoor air screening levels. VISLs are intended to be screened against soil gas samples collected from below building foundations (sub slab samples) (EPA, 2015); however, no occupied buildings are present in the

Source Area. SVMPs screened above 25 feet (ft) below ground surface (bgs) are screened against NMED VISLs. NMED VISLs are not appropriate screening levels for deeper SVMPs. Kirtland AFB will continue to work with NMED to develop appropriate site-specific screening levels for soil and soil vapor at depth. Pending resolution, data was screened in the manner indicated above in this report.

2.2 Regulatory Correspondence and RCRA Permit Requirements

Regulatory correspondence for Q2 2021 is provided in Appendix A-1. In addition, the following documents are provided in Appendix A-2:

- Response to NMED regulatory comments to the Quarterly Monitoring Report for April–June 2019 (NMED, 2020b) (Note: The letter was received on July 11, 2020, but was labeled as July 11, 2019)

- Response to reporting requirements for all document submittals dated September 2, 2020

A crosswalk table between the RCRA Permit reporting requirements and this Periodic Monitoring Report is provided as Appendix A-3.

Operation of the GWTS and performance monitoring are subject to the terms of Class V Underground Injection Well Discharge Permit (DP) No. 1839 (DP-1839, NMED, 2017a) for injecting treated groundwater to KAFB-7 and KAFB-106IN2. A crosswalk table between DP-1839 and this Periodic Monitoring Report is provided as Table 2-1. Kirtland AFB is also permitted to discharge to Tijeras Arroyo under National Pollutant Discharge Elimination System Permit NM0031216 (EPA, 2019). This discharge point is designated for emergency situations only (i.e., in the event that the Golf Course main pond [GCMP], KAFB-7, and KAFB-106IN2 are all inoperable) and has not been used to date.

2.3 Analytical Reporting Limits

In accordance with Department of Defense (DoD) quality management policy, groundwater sample analysis was performed in accordance with DoD Quality Systems Manual (QSM) Version 5.3 (DoD and Department of Energy, 2019) as applicable to each analytical method. The DoD QSM is applicable to EPA SW-846 methodologies being performed on project samples. Drinking water analyses being performed under this contract are in accordance with the RCRA Permit and project work plans. DoD QSM reporting limit requirements include: (1) detection limit, (2) limit of detection (LOD), and (3) limit of quantitation (LOQ). The DoD reporting limits are commonly associated with the EPA method detection limit, reporting detection limit, and practical quantitation limit. Per DoD QSM reporting requirements, sample results below the LOQ and above the detection limit are reported with a "J" qualifier, signifying estimated data; however, the "J" qualifier may be used for analytical results above LOQ that are estimated for other reasons. Non-detect sample results are reported with a "U" qualifier at the LOD.

3. SCOPE OF ACTIVITIES

The following activities were performed during Q2 2021:

- Soil vapor monitoring
- Groundwater sampling
- Water level and LNAPL gauging
- Drinking water supply well sampling
- GWTS operation and maintenance (O&M)
- Chemical analysis of samples collected
- Investigation-derived waste (IDW) management, disposal, and reporting

Field methods are provided in Appendix B-1, and a list of former GWM well identifications for cross-reference with historical documentation is provided in Appendix B-2. A consolidated GWM Work Plan (Kirtland AFB, 2021a) and an updated O&M plan (Kirtland AFB, 2021b) were submitted to NMED in Q1 2021 and will be implemented following approval by NMED. Approximately 99 percent of planned work was conducted in Q2 2021. Deviations from planned activities are discussed in Section 9.

3.1 Soil Vapor Monitoring

SVM was performed in accordance with the Work Plan for Vadose Zone Coring, Vapor Monitoring, and Water Supply Sampling Revision 1 (Kirtland AFB, 2017b), approved with conditions by NMED in the letters dated January 4, 2017 (NMED, 2017b) and February 23, 2018 (NMED, 2018a).

In Q2 2021, the SVM network consisted of 299 SVMPs located in 59 nested SVM wells (Figure 3-1). Each SVM location is comprised of up to six SVMPs, each screened at discrete intervals ranging from approximately 7 to 450 ft bgs. Each SVMP has a unique database identification, which includes the SVM location followed by a number identifying the approximate depth of the screened interval of the SVMP (e.g., KAFB-106135-025 and KAFB-106135-050 are two of six SVMPs located at KAFB-106135, with the bottom of the screened intervals at 25 and 50 ft bgs, respectively). Although screen depths vary across the vapor network, nominal depths of 25, 50, 100, 150, 250, 350, and 450 ft are used to group various screen intervals for evaluation. Table 3-1 lists each SVM sample location, its associated SVMPs (location identification), the screen intervals, and the calculated purge volumes. SVM locations are shown on Figure 3-1. Field methods for SVM are presented in Appendix B-1. In Q2 2021, soil vapor samples were collected from all 299 SVMPs.

Nested SVM locations are grouped by their location into three areas of interest (AOIs) that are all located south of Ridgecrest Drive SE (Table 3-1 and Figure 3-1):

- The Off-Base AOI includes five SVM locations consisting of 28 SVMPs. These SVM locations are in non-residential areas: in Bullhead Park, city of Albuquerque open space, or the Raymond G. Murphy Veterans Affairs (VA) Medical Center parking lot.

- The On-Base Outside of the Source Area AOI includes 41 SVM locations consisting of 227 SVMPs.

- The On-Base, Inside of the Source Area AOI includes 13 SVM locations consisting of 44 SVMPs. The soil vapor source area, established in the Phase I RCRA Facility Investigation

Report (Kirtland AFB, 2018a), is defined as a 100-ft buffer zone around the original underground jet fuel pipelines that were the source of the BFF releases. These pipelines were removed in 2010.

3.1.1 New Soil Vapor Monitoring Activities

In Q2 2021, 15 SVMPs in three SVM locations (KAFB-106V1, KAFB-106V2, and KAFB-106V3) were added to the sampling network. KAFB-106V1 and KAFB-106V2 are located in the On-Base Inside the Source Area AOI, and KAFB-106V3 is located in the On-Base Outside of the Source Area AOI.

3.2 Groundwater Monitoring

GWM was performed in accordance with the applicable technical requirements in Part 6.5 of the RCRA Permit (NMED, 2010) and the following work plans:

- Work Plan for BFF Expansion of the Dissolved-Phase Plume GWTS Design Revision 2 (Kirtland AFB, 2017a), approved with conditions by NMED in the letter dated May 31, 2017 (NMED, 2017c)

- Work Plan for Vadose Zone Coring, Vapor Monitoring, and Water Supply Sampling Revision 1 (Kirtland AFB, 2017b), approved with conditions by NMED in the letter dated February 23, 2018 (NMED, 2018a)

- Work Plan for Data Gap Monitoring Well Installation (Kirtland AFB, 2017c), approved with conditions by NMED in the letter dated February 28, 2018 (NMED, 2018b)

The GWM program is summarized on Table 3-2. For Q2 2021, the GWM network was comprised of 174 GWM wells (Figure 3-2 and Table 3-2), including 167 wells that are sampled on a quarterly or semiannual basis, six wells that are gauged but not sampled (KAFB-106148-484, KAFB-106150-484, KAFB-106154-484, KAFB-106155-484, KAFB-106156-484, and KAFB-106252-515), and one well that is gauged and will be sampled once the water level rises within the screened interval to allow for low-flow sampling (KAFB-106211). A subset of GWM wells within the overall GWM network are sampled during Q1 and third quarter (Q3) 2021. These wells are included on Figure 3-3.

Q2 2021 GWM activities included gauging the depths to groundwater, measuring LNAPL thicknesses, groundwater sampling, and measuring field parameters for samples collected from wells using low-flow techniques. Field parameter measurements were not performed for groundwater samples collected using passive sampling methodology, as discussed in more detail in Appendix B-3. Table 3-3 presents well-specific information (including sampling date, sampling system, screen submergence, and analytical suite) for wells sampled during Q2 2021. Work was performed following the field methods provided in Appendix B-1. Groundwater samples were submitted for laboratory analysis, and results are presented in Section 5.

Prior to the fourth quarter (Q4) of 2018, GWM wells were assigned designations based either on their location relative to the groundwater gradient and their lateral relationship to the dissolved-phase EDB plume or simply on their location (i.e., source area). In response to the changing regional groundwater gradient, GWM wells and their associated groundwater data are currently described based on one of the three reference elevation intervals (REIs) for the BFF site: 4857, 4838, and 4814 (Figure 3-4). REIs are horizons underneath the site designated by their elevation in feet above mean sea level that divide the GWM network into data sets comprised of wells that are screened across these elevations, thus allowing for a vertical evaluation of groundwater parameters and contaminant concentrations. A detailed

explanation of how the REIs are defined is provided in Appendix B-3. In addition, this appendix includes discussion of the field parameters in reference to passive sampling, passive sampling data evaluation, regional groundwater gradient, and former well designations and associated sampling regimes. The former well designations and the current sampling regime by quarter are provided in Table 3-2.

In this report, results of samples collected from GWM wells are discussed based on their location (north or south) in relation to Ridgecrest Drive SE, as the Source Area Plume is located south of Ridgecrest Drive SE. The IMOA for groundwater is located north of Ridgecrest Drive SE (Figure 3-2).

3.2.1 New Groundwater Monitoring Activities

Six GWM wells were installed between November 2020 and March 2021 in accordance with the Work Plan for Data Gap Monitoring Well Installation KAFB-106248 to KAFB-106252 (Kirtland AFB, 2019). These monitoring wells were completed as nested wells that included one water table well and one well screened in the vadose zone to account for expected rise of the water table. The nomenclature for these wells follows the convention used for previous nested GWM wells installed at SWMUs ST-106/SS-111 including the prefix KAFB, the borehole identification, and a three-digit suffix identifying the depth in feet below ground surface to the top of the screen in each well. Each of these wells was sampled in Q2 2021. The six new GWM wells will require a total of eight quarters of baseline sampling before they will be incorporated in the sampling regimen based on their objective. The number of baseline sampling events conducted for these six GWM wells was as follows at the end of Q2 2021:

- Two quarters of baseline sampling were completed for monitoring well KAFB-106S10-443, installed in Q4 2020.

- One quarter of baseline sampling was completed for the remaining five GWM wells, KAFB-106248-444, KAFB-106249-450, KAFB-106250-413, KAFB-106251-409, and KAFB-106252-425, which were installed in first quarter (Q1) 2021.

- In accordance with the Work Plan for Data Gap Monitoring Well Installation KAFB-106248 to KAFB-106252 (Kirtland AFB, 2019), newly installed wells were sampled within 10 days of well development. For wells KAFB-106249-450, KAFB-106250-413, and KAFB-106251-409, the initial sampling event occurred between the Q1 and Q2 2021 monitoring events, and the results of the initial sample are presented in this report for informational purposes only. The results from the initial sampling event will also be presented in the well completion report for these wells to be submitted to NMED in October 2021.

3.3 Drinking Water Supply Well Sampling

Drinking water supply well sampling was performed in accordance with the Work Plan for Vadose Zone Coring, Vapor Monitoring, and Water Supply Sampling Revision 1 (Kirtland AFB, 2017b), approved with conditions by NMED in the letter dated February 23, 2018 (NMED, 2018a). Well locations are shown on Figure 3-5.

3.4 Interim Measure

The GWTS is part of the interim measure implemented pursuant to the corrective action provisions in Kirtland AFB's RCRA Permit, which states that interim measures may be necessary to reduce or prevent migration of hazardous wastes or hazardous constituents that have, or may result in, an unacceptable human or environmental receptor exposure to hazardous wastes or hazardous constituents while long-term

corrective actions remedies are being evaluated and implemented (NMED, 2010.) The purpose of this interim measure is to collapse and treat the dissolved-phase EDB plume within the IMOA, which is located north of Ridgecrest Drive SE. GWTS operations, sampling, and the discharge of treated effluent were performed in accordance with the following:

- GWTS O&M Plan (Kirtland AFB, 2016a), which was approved with modifications by NMED in the letter dated December 12, 2016 (NMED, 2016), and revisions to the O&M Plan, which address the expanded GWTS (Kirtland AFB, 2017d, 2018b)
- DP-1839, issued by NMED in April 2017 (NMED, 2017a)
- EPA National Pollutant Discharge Elimination System Permit No. NM0031216, issued in September 2019 (EPA, 2019)

The location of the GWTS and approved discharge locations are shown on Figure 1-2.

3.5 Data Review and Usability

3.5.1 Soil Vapor

Environmental Data Services, Inc. performed EPA Stage 3 data validation on 23 percent of Q2 2021 soil vapor analytical data. In addition, all data underwent data verification in accordance with the approved work plan (Kirtland AFB, 2017b). Analytical results were qualified as estimated detects "J" and estimated non-detect data "UJ" based on exceedance of data quality indicator criteria. A "U" data qualifier is used by the laboratory during validation to denote analytes reported as non-detect in samples per EPA and DoD data validation guidelines. Qualified analytical data are usable to achieve project objectives.

3.5.1.1 Soil Vapor Dilution and Data Usability

In accordance with Part 6.5.18 of the RCRA Permit (NMED, 2010), no Q2 soil vapor samples were diluted prior to analysis. During analysis, sample dilution can be performed per the EPA analytical method in order to bring elevated concentrations of analytes into the instrument calibration range for quantitation. Q2 soil vapor samples that required dilution due to elevated analytes in the sample (target or non-target) resulted in elevated reporting limits for all analytes in the sample per standard analytical method protocol.

DoD detection limits and LODs for the analyses used to quantify EDB and benzene (which are site contaminants of potential concern) were below the NMED Residential VISL for soil gas of 1.56 micrograms per cubic meter ($\mu g/m^3$) and 120 $\mu g/m^3$, respectively (NMED, 2019). The required dilution during analysis due to elevated concentrations of one or more analytes in the sample resulted in soil vapor sample results at the 25 ft horizon with reporting limits above the residential VISLs for EDB and other volatile organic compounds (VOCs). This is not considered an analytical deficiency, and data are still considered usable to achieve project objectives (i.e., results are valid per analytical and validation requirements).

As a result of data validation, Q2 soil vapor sample results were qualified "J", "U", and "UJ", signifying estimated detect, non-detect, and estimated non-detect data. Q2 samples were analyzed in accordance with DoD QSM and EPA analytical methodology, and 100 percent technical data completeness was achieved for the Q2 soil vapor data.

Final validated Q2 soil vapor data are included in Appendix C. The Data Quality Evaluation Report for Q2 soil vapor samples is provided in Appendix C-1, and the EPA Level II laboratory data reports are provided in Appendix C-2. Appendix C-3 provides the complete final validated Q2 soil vapor analytical data file.

3.5.2 Groundwater

Laboratory deliverables and data quality evaluation reports were prepared and provided in accordance with Parts 6.5.18.2 and 6.5.18.3 of the RCRA Permit (NMED, 2010). Data verification and data validation are sequential steps in a data review process; data verification was performed by the contractor collecting the data, and an independent third-party subcontractor performed the data validation. Data verification was performed to ensure method, procedural, and contractual compliance with project-specific requirements in the Quality Assurance Project Plan (QAPP), Appendix D of the Work Plan for BFF Expansion of the Dissolved-Phase Plume GWTS (Kirtland AFB, 2017a).

Following data verification, the Q2 2021 groundwater analytical data underwent 100 percent EPA Stage 2B data validation by an independent third-party subcontractor, Environmental Data Services, Inc. Data validation consisted of an analyte- and sample-specific process that extends the evaluation of analytical data beyond the data verification process to determine the quality of a specific data set in accordance with analytical method quality control and DoD QSM requirements as documented in the QAPP (Kirtland AFB, 2017a). Data validation included review of data quality indicators to assess the precision, accuracy, representativeness, comparability, completeness, and sensitivity of the analytical data set and determine if the data achieved the project data quality objectives. Data qualifiers that may be applied to data during the validation process include "J", "U", and "R." The "J" qualifier signifies an estimated result, the "U" qualifier indicates a non-detect result, and the "R" qualifier signifies rejected data. Data qualified with "J" and "U" are usable to achieve project objectives; however, "R" qualified sample data do not meet project objectives and are rejected. No data collected in Q2 2021 data were rejected. Upon completion of the data verification and validation process, the data were assessed to determine if the project data quality objectives were achieved and deemed usable for their intended purpose.

Based on the validation, analytical data were qualified "J" and "UJ" for estimated detect and estimated non-detect data, respectively, and "U" for non-detect results. During Q2 2021, 86 detect and non-detect sample results were reported with LOQ/practical quantitation limits that exceeded the project screening level as a result of the high concentration of target analytes in the sample and, therefore, requiring sample dilution during analysis. Elevated concentrations of target analytes in a sample require sample dilution during analysis in order to meet DoD QSM and EPA analytical method criteria. When samples required dilution, all analyte reporting limits become elevated by the amount of the dilution and thus resulted in the exceedances listed in Appendix D-1─Table 7. Data validation guidelines determine these data to be usable and achieve project data quality objectives. In addition, five VOC analytes have LOQs that exceed the EPA Tapwater screening level (EPA, 2021), and the laboratory is using the best analytical methodology available to analyze VOCs. These VOCs are not considered to be site contaminants of concern.

Data from GWM monitoring in Q2 2021 were found to be usable to achieve the project data quality objectives as qualified based on validation. Final validated groundwater analytical data are included in Appendix D. The Data Quality Evaluation Report for groundwater samples collected in Q2 2021 is provided in Appendix D-1 and the EPA Level II laboratory data reports are provided in Appendix D-2. Further details regarding EPA data verification and validation processes are documented in Figures 2 and

4 of the Guidance on Environmental Data Verification and Data Validation (EPA, 2002) provided in Appendix D-3. Appendix D-4 provides the complete final validated Q2 groundwater analytical data file.

3.5.3 Drinking Water

Following data verification, the Q2 2021 drinking water analytical data underwent a 100 percent Stage 3 data validation performed by Environmental Data Services, Inc. All Q2 data are valid based on the evaluation criteria (no data were qualified), and the data completeness was 100 percent. The data met data quality objectives and were appropriate for use in project decision-making. Upon completion of the verification and validation process, the data were assessed to determine if the project data quality objectives were achieved and deemed usable for their intended purpose.

Final validated drinking water analytical data are included in Appendix E. The Data Quality Evaluation Report for drinking water samples collected in Q2 2021 is provided in Appendix E-1, and the EPA Level II laboratory data reports are provided in Appendix E-2. Appendix E-3 provides the complete final validated Q2 drinking water analytical data file.

3.5.4 Interim Measure

The GWTS analytical data from Q2 2021 underwent EPA Stage 2B data validation by Validata Chemical Services, Inc., Duluth, Georgia, following data verification. Data were qualified "U" and "UJ" during the validation process based on exceedance of laboratory QC criteria. Qualified data are still deemed usable to achieve project objectives based on validation guidance.

Upon completion of the data verification and validation process, the data were assessed for accuracy, precision, representativeness, comparability, completeness, and sensitivity to determine if the project data quality objectives were met and were deemed usable for their intended purpose.

Final validated GWTS groundwater analytical data are included in Appendix F. The Data Quality Evaluation Report for GWTS samples collected in Q2 2021 is provided in Appendix F-1, and the EPA Level II laboratory data reports are provided in Appendix F-2. Appendix F-3 contains the complete final validated Q2 GWTS analytical data file.

3.5.5 Final Data Upload

Subsequent to performing data validation, the validation data qualifiers were uploaded to the EQuIS® project database. The Q2 2021 groundwater, drinking water, and soil vapor analytical data presented and discussed in this report are final validated data, determined through validation to have achieved project data quality objectives, and are deemed usable for the project objectives. Final validated data will be uploaded to the U.S. Air Force data repository through the Environmental Resources Program Information Management System. EPA Level IV data packages will be maintained by Kirtland AFB and made available to NMED upon request in accordance with Part 6.5.18.2 of the RCRA Permit (NMED, 2010).

4. VADOSE ZONE MONITORING

This section describes the results for the semiannual soil vapor sampling for Q2 2021 at Kirtland AFB. Semiannual soil vapor sampling was conducted to characterize and monitor fuel-related contaminant concentrations in the vadose zone. Sections 4.1 and 4.2 discuss field sampling, analytical results, data usability, and results of soil vapor data collected during Q2 2021, and Section 4.3 discusses routine maintenance and repairs conducted on the soil vapor monitoring well network.

SVM sampling activities are provided in Appendix G, Soil Vapor Field Sampling Results, as follows:

- Appendix G-1 Soil Vapor Purge Logs
- Appendix G-2 Soil Vapor Field Daily Quality Control Reports
- Appendix G-3 Soil Vapor Chain-of-Custody Forms

4.1 Vadose Zone Soil Vapor Data Collection

To the extent possible, soil vapor samples collected in Q2 2021 represented the vadose zone conditions without the influence of induced airflow. All SVMP sample ports were sealed to atmospheric air, which minimized exchanges with atmospheric "inhalation" and "exhalation" cycles, driven by barometric pressure fluctuations.

SVM was performed in accordance with Part 6.5.16 of the RCRA Permit. In accordance with the letter outlining NMED reporting guidance for all document submittals (NMED, 2020a) and NMED comments on the Q2 2019 report (NMED, 2020b), analytical results for the current and three previous sampling events are provided in a searchable, sortable format in Appendix C-3. The condition of the vault and the pneumatic quick-connect fittings at each SVMP were documented on purge logs to document sample representativeness (Appendix G-1).

Field parameters, including total hydrocarbon (HC), oxygen (O_2), and carbon dioxide (CO_2) concentrations, were measured and recorded at each SVMP using a Horiba MEXA-584L auto emissions analyzer (Horiba). SVMPs were purged of their respective casing volume before field measurements were recorded and before samples were collected. Static air pressure readings (in inches of water) were measured using an electric manometer and recorded on purge logs for pre-purging and post-purging conditions of each well to ensure the stability of each well before sampling. Purge data were recorded on purge logs (Appendix G-1); field data are provided in Table 4-1. Horiba calibration and sample system leak tests were performed and documented on calibration logs (Appendix G-2); daily quality control reports are provided in Appendix G-2.

In Q2 2021, soil vapor samples were collected from wells shown on Figure 4-1 and wells listed in Table 4-1 between April 5 and June 24, 2021, including the resample at SVMP KAFB-106139-250 due to a defect with the initial Summa canister that prevented the laboratory from accessing the sample. In addition, confirmation vapor samples were collected at locations KAFB-106V3-007, KAFB-106V3-015, and KAFB-106V3-272 in order to better understand the results obtained at that location during the initial Q2 2021 sampling event. Significant disturbance of soil vapors around the site may have resulted from the recent installation of SVMW KAFB-106V3, which was installed using high pressure air rotary drilling techniques. If this was the case, the confirmation sample data may be more indicative of equilibrium soil vapor conditions around the wellbore. Both the original and re-sampling data are described in Section 10.1.2.2. Analytical data from both sampling events are included in Table 4-3.

In total, 299 SVMP locations were sampled, and 30 field duplicates were collected using certified pre-

evacuated Summa canisters fitted with a specialized pneumatic connector to allow only the vapor from the SVMP to enter the canister. Sample information was recorded on purge logs (Appendix G-1). Chain-of-custody records are provided in Appendix G-3. After collecting each SVMP sample, each Summa canister was placed in protective packaging and shipped to ALS Environmental in Simi Valley, California, for VOC analysis by EPA Method TO-15.

Soil vapor analytical results are provided in Tables 4-2 through 4-4. Analytical data for the current and three previous sampling events are provided in Appendix C-3. Data presented and discussed in this report are final validated data. The Environmental Resources Program Information Management System data deliverable was submitted in June 2021.

4.2 Q2 2021 Soil Vapor Monitoring and Chemical Analytical Data Results

The Q2 2021 analytical results and field data from the 299 SVMPs were used to generate two-dimensional plan-view maps (Figures 4-1 through 4-7) that depict benzene, EDB, and HC concentrations at nominal depths of 25, 50, 100, 150, 250, 350, and 450 ft bgs, respectively. Field parameters collected during the SVM event include static pressure, HC, O_2, and CO_2 (Table 4-1). Soil vapor analytical results are provided in Tables 4-2, 4-3, and 4-4 based on the AOI where the sampling point is located.

Sections 4.2.1 through 4.2.3 discuss the soil vapor concentrations of EDB, benzene, HC, O_2, and CO_2 in relation to each AOI. The data for EDB and benzene are based on laboratory analysis, while HC, O_2, and CO_2 are field monitoring measurements. Samples collected at nominal depths of up to 25 ft bgs were compared against VISLs, as discussed in Section 10.1.2.

4.2.1 Off-Base Soil Vapor Monitoring Points

Consistent with prior sampling events, off-Base soil vapor concentrations were reported to be very low in comparison to the on-Base AOIs (Tables 4-1 and 4-2).

4.2.1.1 Field Monitoring Results

HC concentrations in the 28 off-Base SVMPs ranged from 0 to 14 parts per million by volume (ppmv). The highest HC concentration of 14 ppmv was measured at KAFB-106142-450.

O_2 concentrations measured at off-Base SVMPs averaged 19.92 percent, near atmospheric levels of approximately 21 percent (Berner et al., 2007). CO_2 levels ranged from 0.12 percent to 3.12 percent. The maximum CO_2 level (3.12 percent) was measured at KAFB-106138-050; however, CO_2 levels were measured below 1.00 percent at 26 of the 28 SVMPs.

4.2.1.2 Chemical Analytical Results

The following is a summary of the analytical results for SVMPs located off-Base (Table 4-2):

- EDB was reported in two of the 28 off-Base SVMPs. EDB was reported at a concentration of 3.8 µg/m^3 at KAFB-106028-450 and estimated at 2.0 µg/m^3 at KAFB-106142-350.

- Benzene was reported in 20 of the 28 SVMPs. Of the 20 benzene detections, 19 were estimated concentrations (J-flag values) of 4.2 µg/m^3 or less. The single non-estimated detection was reported to have a concentration of 240 µg/m^3 at KAFB-106142-450.

4.2.2 On-Base Soil Vapor Monitoring Points Outside of Source Area

Findings in the on-Base SVM AOI located outside of the source area were consistent with previous sampling events (Tables 4-1 and 4-3). The highest soil vapor concentrations reported in this AOI were located adjacent to the source area and above the groundwater benzene plume.

4.2.2.1 Field Monitoring Results

HC concentrations ranged from 0 to 19,390 ppmv, with the highest concentration measured at SVMW-02-100, located approximately 50 ft north of the source area.

Concentrations of O_2 were relatively low (<15 percent) in 52 SVMPs, and the CO_2 levels ranged from 0.04 to 13.64 percent.

4.2.2.2 Chemical Analytical Results

On-Base, outside of the source area, laboratory analytical results for EDB and benzene were as follows:

- EDB was detected in 18 of the 227 SVMPs, with the highest concentrations of 4,800 µg/m^3 at KAFB-106128-450 and 14,000 µg/m^3 at SVMW-02-100.

- Benzene was detected in 194 of the 227 SVMPs, with the highest concentration of 570,000 µg/m^3 at both SVMW-02-100 and SVMW-02-150, located approximately 50 ft north of the source area.

4.2.3 On-Base Soil Vapor Monitoring Points Inside the Source Area

The results of the on-Base SVM AOI located inside the source area presented in Tables 4-1 and 4-4 are discussed below.

4.2.3.1 Field Monitoring Results

HC measurements at SVMPs in this AOI ranged from 1 to 27,150 ppmv. The highest concentration of HC was measured at KAFB-106V2-117.

Measured O_2 levels inside the AOI ranged from 0.10 percent to 20.88 percent. Eight SVMPs had O_2 levels below 5 percent at nominal depths ranging from 50 to 300 ft bgs, which is an increase from Q4 2019 when O_2 levels greater than 5 percent were only measured in four SVMPs.

CO_2 levels ranged from 0.02 to 15.62 percent, with the maximum level of 15.62 percent measured at SVMW-03-050.

4.2.3.2 Chemical Analytical Results

Consistent with previous monitoring events, the highest concentrations of EDB and benzene were detected in samples collected from this AOI. The following summarizes the laboratory analytical data for samples collected from this AOI:

- EDB was detected in 12 of the 44 SVMPs, with a maximum concentration of 40,000 µg/m^3 in the sample collected from SVMW-10-050.

- Benzene was detected in all but one SVMP within the source area, with a maximum concentration of 1,500,000 µg/m^3 in the sample collected from KAFB-106V2-117.

4.3 Soil Vapor Monitoring Well Network Maintenance

Maintenance and repairs were performed as necessary at all 59 SVM locations following completion of the Q2 2021 sampling event. Any maintenance needs, including corroded quick-connects, worn or damaged gaskets, overgrown vegetation, and overall cleanliness of locations, were noted during the sampling event and addressed during the maintenance event that took place between May 17 and 18, 2021. All maintenance activities were performed after Q2 2021 samples were collected and had no effect on the results.

Rusty pneumatic quick-connects were repaired at the following three SVMPs:

- KAFB-106132-250
- KAFB-106133-170
- KAFB-106135-050

Missing quick-connect caps were replaced at the following four SVMs:

- KAFB-106V1
- KAFB-106V2
- KAFB-106V3
- SVMW-10

Standing water was removed from the vaults at the following SVMWs, for which new seals will be procured:

- SVEW-12/SVMW-14
- SVMW-10

5. GROUNDWATER MONITORING

The following sections discuss the analytical results for samples collected from GWM wells during Q2 2021. Appendix H contains the field sampling data and records, as follows:

- H-1 Daily Quality Control Reports – Groundwater Sampling
- H-2 Groundwater and Light Non-Aqueous Phase Liquid Measurements
- H-3 Groundwater Purge Logs and Sample Collection Logs
- H-4 Groundwater Sample Chain-of-Custody Forms
- H-5 U.S. Geological Survey Sentinel Well Data

5.1 Monitoring Results

5.1.1 Groundwater and Light Non-Aqueous Phase Liquid Gauging

Gauging was performed in 172 GWM wells in Q2 2021 (Table 5-1). Depth to water and thickness of LNAPL in the GWM wells were gauged using five oil-water interface probes, each dedicated to groups of wells with similar historical levels of contamination. Measurement differences from a control probe were calculated in accordance with the methods described in Appendix B-1 and are presented in Appendix H-2, Table H-2-1. Subsequent data corrections are presented in Appendix H-2, Table H-2-2. Gauging deviations, including wells not gauged, are discussed in Section 9.2.1.

The interface probes were checked for proper operation, and the cables were checked for integrity prior to each use; the equipment was decontaminated after gauging each well. If LNAPL was detected using the interface probe, a plastic bailer was used to confirm the presence and thickness of the LNAPL. Additionally, during low-flow sampling using Bennett pumps, every well was checked for the presence of LNAPL prior to setting the pump. Depths to LNAPL, if applicable, and groundwater were recorded in the field on electronic well gauging forms (Appendix H-2, Table H-2-2).

5.1.2 Groundwater Gauging Monitoring Results

Groundwater elevations and LNAPL thicknesses are summarized in Table 5-1. Table 5-2 includes LNAPL data from the current quarter and Q2 and Q4 2020. Wells in REI 4857 were initially installed with the screen intersecting the water table; however, due to the rise of the water table, a number of the wells in REI 4857 have fully submerged screens, with submergence depth ranging from 0.15 to 23.48 ft above the top of the screen in KAFB-106222 and KAFB-106025, respectively (Table 5-1).

The water table potentiometric surface map was created using only REI 4857 GWM wells with screens that are not submerged (Figure 5-1). Horizontal groundwater gradients within REI 4857 are dominated by a radial flow pattern toward depressions in the water table, which are primarily due to groundwater extraction for treatment. The potentiometric surfaces for REI 4838 (Figure 5-2) and REI 4814 (Figure 5-3) are presented in Q2 and Q4 of each year.

LNAPL was present in five wells (KAFB-106005, KAFB-106059, KAFB-106076, KAFB-106150-484, and KAFB-106154-484) at thicknesses ranging from 0.01 ft to 0.39 ft (Table 5-1). Figure 5-4 depicts the wells where LNAPL was detected in Q2 as well as historical LNAPL locations. The extent of LNAPL is confined to the area south of Ridgecrest Drive SE, on Kirtland AFB, and within the footprint of the Source Area Plume. Wells with screens not submerged that do not contain LNAPL were used to confirm that the lateral extent of LNAPL is defined.

5.2 Groundwater Sampling

Groundwater samples were collected from 167 wells of the GWM network between March 23 and April 29, 2021. The sampling technique used to sample the wells is provided in Table 3-3. EDB and benzene analytical data are presented on Figures 5-5 through 5-10. Well locations are shown on Figure 3-2, and sentinel well locations are shown on Figure 5-11; sentinel wells are those located between contaminant plumes and a water supply well. These wells provide early detection if contaminants migrate toward the water supply wells.

The groundwater samples collected from each well were analyzed for the specific analytical suite specified in Tables 3-2 and 3-3. Field parameters were measured in select wells as per the monitoring regimen. Groundwater samples were analyzed by Eurofins Lancaster Laboratories Environmental, LLC located in Lancaster, Pennsylvania, which maintains current DoD Environmental Laboratory Accreditation Program certification. Sampling was conducted in accordance with the applicable technical requirements in Parts 6.5.5 and 6.5.17 of the RCRA Permit (NMED, 2010).

Appendix B-1 describes the field methods used for GWM. The groundwater purge and sampling forms are provided in Appendix H-3, and the chain-of-custody forms are provided in Appendix H-4.

Wells KAFB-106149-484, KAFB-106151-484, KAFB-106152-484, and KAFB-106153-484 were added to the GWM network in Q1 2018 to fill a data gap that was created due to rising groundwater that caused some well screens to become fully submerged (Kirtland AFB, 2017c). Wells KAFB-106149-484, KAFB-106151-484, KAFB-106152-484, and KAFB-106153-484 were originally designed and installed for the purpose of vadose zone characterization, with the bottom of the screened interval reaching a depth approximately 5 ft above the water table at the time of installation. As the water table rose, it entered the screened interval of these wells. In 2018, there was sufficient water column within the wells for groundwater sampling, and they were added to the GWM program to temporarily fill the data gap. New wells designed for GWM with screens intersecting the water table were installed and developed between 2018 and Q1 2021 to fill this gap (Figure 3-2).

5.2.1 Field Parameter Monitoring Results

Field parameters were collected from wells that were sampled using the low-flow sampling method; these wells are located south of Ridgecrest Drive SE. Field parameter data are presented in Table 5-3. Historical field parameter data from the three previous quarters are presented in Appendix H-3, Table H-3-1.

5.3 Groundwater Samples Analytical Results

The analytical results for the samples and the field duplicates are presented in Tables 5-4 and 5-5 and were used to assess field sampling precision; however, field duplicate results are not discussed in this text unless otherwise noted and are not provided on figures. Analytical results and screening levels are provided in a sortable, searchable format in Appendix D-4. Analytical results for the initial samples collected from newly installed wells KAFB-106249-450, KAFB-106250-413, and KAFB-106251-409 are included in Appendix D-4 for informational purposes only. A discussion of the results for the duplicate sample analytical results is included in the Data Quality Evaluation Report (Appendix D-1).

In this report, sample results from GWM wells are discussed based on their location relative to the IMOA, the southern border of which is defined by Ridgecrest Drive SE (Figure 3-2); as a consequence, they will be described as north or south of Ridgecrest Drive SE. The Source Area Plume is located south of Ridgecrest Drive SE while the IMOA for the groundwater interim measure is located north of it.

The following analytical methods were used for sample analysis:

- EDB by EPA Method SW8011
- BTEX and VOCs by EPA Method SW8260C
- Total petroleum hydrocarbons by EPA Method SW8015D (KAFB-106S10-443 only)
- Metals by EPA Methods SW6010C and SW6020A
- Anions by EPA Methods E300.0 and E353.2
- Alkalinity by Standard Method 2320B

5.3.1 Organic Compounds Analytical Results

The following subsections discuss EDB and BTEX analytical results for the current quarter.

5.3.1.1 EDB Analytical Results

Results for EDB for the new monitoring wells KAFB-106248-452, KAFB-106249-450, KAFB-106250-447, KAFB-106251-443, KAFB-106252-425, and KAFB-106S10-443 are presented in Table 5-4, while analytical results of EDB for the other wells sampled in Q2 are presented in Table 5-5. Historical EDB analytical results for the previous three sampling events are provided in Table 5-6. EDB concentrations are depicted on Figures 5-5 through 5-7. The northern plume appears slightly larger than historical depictions; however, this appears to be the result of extraction well KAFB-106234 operating as designed. The observed mass will eventually be captured by this extraction well (Figure 5-5) because the capture analysis indicates that the plume is 100 percent captured by the interim measure (IM) (see Section 10.4). Note that Figure 5-5 utilizes the primary sample value of 0.019 J micrograms per liter (µg/L) for well KAFB-106225 (Table 5-5), as the primary results are used in the discussion of analytical results, while duplicate results are used for quality control purposes. However, the duplicate value of 0.041 µg/L was utilized for the performance assessment discussed in Section 10.4.1 in order to present the most conservative estimate.

There were no detections of EDB in sentinel GWM wells in Q2 2021; sentinel well locations are shown on Figure 5-11.

EDB Analytical Results North of Ridgecrest Drive SE

EDB analytical results in the IMOA north of Ridgecrest Drive SE are as follows:

- EDB was above the project screening level of 0.05 µg/L in groundwater collected from four wells (KAFB-106036, KAFB-106041, KAFB-106042, and KAFB-106088) located in the IMOA north of Ridgecrest Drive SE.

- EDB was detected but below the project screening level in groundwater collected from seven monitoring wells located in the IMOA (KAFB-106022, KAFB-106035, KAFB-106089, KAFB-106205, KAFB-106225, KAFB-106241-428, and KAFB-106243-425).

EDB Analytical Results South of Ridgecrest Drive SE

EDB analytical results south of Ridgecrest Drive SE are as follows:

- Concentrations of EDB exceeded the project screening level of 0.05 µg/L in groundwater

collected from 20 wells located south of Ridgecrest Drive SE.

- The highest EDB concentration was detected in the groundwater sample collected from well KAFB-106S8-451 at 380 µg/L, which is located on Kirtland AFB in REI 4857 in the eastern portion of the source area.

5.3.1.2 BTEX Analytical Results

The results for BTEX for the new monitoring wells KAFB-106248-452, KAFB-106249-450, KAFB-106250-447, KAFB-106251-443, KAFB-106252-425, and KAFB-106S10-443, are presented in Table 5-4, while analytical results of BTEX for the other wells sampled in Q2 2021 are presented in Table 5-5. Historical BTEX analytical results for the previous three sampling events are provided in Table 5-7. Benzene concentrations are depicted on Figures 5-8 through 5-10.

There were no detections of BTEX in sentinel GWM wells in Q2 2021; sentinel well locations are shown on Figure 5-11.

BTEX Analytical Results North of Ridgecrest Drive SE

One well in the IMOA was sampled for BTEX in Q2 2021, newly installed GWM well KAFB-106252-425. BTEX was not detected in this sample.

BTEX Analytical Results South of Ridgecrest Drive SE

BTEX analytical results south of Ridgecrest Drive SE are as follows:

- Benzene concentrations exceeded the project screening level of 5.0 µg/L in 26 wells. Twenty-four of these wells were located in REI 4857, and two were located in REI 4838 (KAFB-106063 and KAFB-106080). The highest benzene concentration was detected in KAFB-106149-484 at 16,000 µg/L.

- Toluene concentrations exceeded the 1,000 µg/L project screening level in 13 wells; these exceedances were located in REI 4857. The highest toluene concentration was detected in KAFB-106149-484 at 21,000 µg/L.

- Ethylbenzene concentrations exceeded the 700 µg/L project screening level in nine wells. These wells are located in REI 4857. The highest ethylbenzene concentration was detected in KAFB-106064 at 2,000 µg/L.

- Total xylenes concentrations met or exceeded the 620 µg/L project screening level in 18 wells. One exceedance was in REI 4838 (KAFB-106063) and 17 exceedances were located in REI 4857. The highest total xylenes concentration was detected in KAFB-106064 at 5,900 µg/L, located in REI 4857 in the EDB in situ bioremediation pilot test area.

5.3.2 Inorganic Compound Analytical Results

Inorganic compounds include total metals (arsenic, lead, calcium, magnesium, potassium, and sodium), dissolved metals (iron and manganese), and anions (bromide, chloride, sulfate, and nitrate/nitrite nitrogen). Total metals and anions are not site contaminants but are analyzed to evaluate the geochemical conditions of the aquifer.

Table 3-2 lists the wells that were sampled for inorganic compounds in Q2 2021. Inorganic sampling is conducted to assess geochemical aquifer conditions. Inorganic analytical results are presented in Table 5-8.

5.3.3 Sampling Results for U.S. Geological Survey Sentinel Wells

The U.S. Geological Survey (USGS) monitors 14 sentinel wells located in four well nests (USGS VA well nest, USGS Trumbull well nest, USGS Southern well nest, and USGS Caesar Chavez well nest) between the Kirtland AFB BFF EDB plume and water supply wells which are owned and operated by the Albuquerque Bernalillo County Water Utility Authority and Raymond G. Murphy VA Medical Center (Figure 5-11). This monitoring is conducted as a means of providing independent observation of water quality in the vicinity of these water supply wells. Samples are collected from these sentinel wells quarterly. For Q2 2021, these samples were collected using dual membrane samplers from April 5 to April 8, 2021. The samples were analyzed for VOCs and EDB by the USGS National Water Quality Laboratory using Method O-4127-96 (Connor et al., 1998). No detections were found in the Q2 2021 samples. The USGS transmittal letter, including the Q2 2021 data results, is provided in Appendix H-5.

5.4 Groundwater Monitoring Well Network Maintenance

The GWM well network was inspected to ensure that the condition of all protective covers and wellheads met the intended performance and security requirements. During the inspection period, cleaning and maintenance were performed, and all GWM wells were determined to be fully serviceable. The Bennett dedicated pump sampling system from KAFB-106075 was removed on April 29, 2021. The pump failed to operate during quarterly groundwater sampling. Significant corrosion was noted upon removal of the pump.

6. DRINKING WATER SUPPLY WELL MONITORING

Drinking water supply wells KAFB-003, KAFB-015, KAFB-016, and ST106-VA-2 were sampled monthly during this quarter, with the exception of KAFB-016 that was not sampled in May or June, as described in more detail in Section 9.3.

Appendix I, Drinking Water Supply Well Sampling Documentation, provides the following information:

- Appendix I-1: Daily Quality Control Reports – Drinking Water Supply Well Samples
- Appendix I-2: Drinking Water Sample Collection Logs and Chain-of-Custody Forms

The samples collected from the drinking water supply wells were submitted for the following analyses to Eurofins TestAmerica Laboratories in Savannah, Georgia, for the following analyses:

- EDB using EPA Method 504.1
- BTEX using EPA Method 524.2

Analytical results were validated by Environmental Data Services, Inc., and the supporting information is included in Appendix E, as follows:

- Appendix E-1: Data Quality Evaluation Reports
- Appendix E-2: Data Packages – Drinking Water Supply Well Samples
- Appendix E-3: Drinking Water Supply Well Analytical Data

In addition, water samples were collected in April 2021 to be analyzed for the semi-annual analytical suite, which consists of the following inorganic compounds:

- Total metals (calcium, magnesium, potassium, and sodium) using EPA Method 6010C
- Dissolved metals (iron and manganese) using EPA Method 6010C
- Total metals (arsenic and lead) using EPA Method 6020A
- Anions (bromide, chloride, and sulfate) using EPA Method 300.0A
- Anions (nitrate/nitrite nitrogen) using EPA Method 353.2
- Ammonia nitrogen using Standard Method 4500NH3B/C
- Sulfide using Standard Method 4500S2CF
- Alkalinity-bicarbonate/carbonate using Standard Method 2320B

Inorganic samples were submitted to Eurofins Lancaster Laboratories Environmental, LLC located in Lancaster, Pennsylvania. Analytical results were validated by Validata Chemical Services, Inc.

6.1 Drinking Water Supply Well Analytical Results

Appendix E-3 contains analytical data from Q2 2021 and the three previous quarters. EDB and BTEX monthly results for Q2 2021 are presented in Table 6-1 and Figure 6-1. Neither EDB nor BTEX were detected in the samples collected from the drinking water supply wells, consistent with historical results.

Results for the analyses performed semi-annually for inorganic compounds for Q2 2021 are presented in Table 6-2. Inorganic compounds detected in the samples collected from drinking water supply wells KAFB-003 and ST106-VA-2 were below their respective EPA MCLs. The arsenic concentrations detected in the samples collected from KAFB-015 and KAFB-016 in April 2021 were 0.016 and

0.025 mg/L, respectively, both exceeding the MCL of 0.01 mg/L. These arsenic concentrations are consistent with naturally occurring arsenic observed in the Albuquerque Basin (Bexfield and Plummer, 2003). Consequently, Kirtland AFB operates an arsenic compliance system as part of the water treatment system; as a result, arsenic concentrations in the Kirtland AFB drinking water supply do not exceed drinking water criteria (Kirtland AFB, 2003). The other inorganic compounds detected in KAFB-015 and KAFB-016 were below their respective MCLs.

7. INTERIM MEASURE OPERATION AND MONITORING

7.1 Groundwater Treatment System Operation

This section presents the Q2 2021 GWTS operation, performance monitoring and EDB removal, system maintenance and expansion, and additional information required by RCRA Permit Part 6.2.4.1. Appendix J, pertinent to GWTS operation and performance, includes the following:

- Appendix J-1 GWTS Plant O&M Documentation
- Appendix J-2 New Mexico 811 Line Locate Tickets
- Appendix J-3 GWTS Performance Sample Collection Logs

7.1.1 Groundwater Treatment System Treatment Volumes and Percentage Run Time

The GWTS includes:

- Four extraction wells: KAFB-106228, KAFB-106233, KAFB-106234, and KAFB-106239
- Influent conveyance piping
- Two carbon treatment trains (designed for but not currently operating at 800-gallon per minute [gpm] maximum capacity) located within the GWTS building
- Effluent conveyance lines

Treated effluent is discharged to either the Tijeras Arroyo GCMP or is gravity-fed into one of the injection wells, KAFB-7 or KAFB-106IN2 (Figure 6-1). Quarterly run time of the GWTS, extraction well performance metrics, and injection well performance metrics are discussed in the following sections.

7.1.1.1 Quarterly Run Time

For the purpose of run time evaluation, GWTS operation is defined as the time during which groundwater is being pumped from at least one extraction well and subsequently treated and discharged. Table 7-1 provides a monthly and quarterly summary of the extraction well performance during Q2 2021, including individual extraction well run times. During this quarter, the GWTS was operational 97.9 percent of the time (Table 7-1). This included shutdowns during redevelopment of KAFB-106IN2, which affected the overall run time. Shutdowns are described in Sections 7.4.1 and 7.4.3.

Table 7-2 provides a cumulative summary of groundwater quantities extracted, treated, and discharged. During Q2 2021, the GWTS treated 68,538,600 gallons of groundwater, of which 42,317,600 gallons were treated in Train 1 and 26,221,000 gallons in Train 2. The GCMP received 50,947,000 gallons of the treated effluent, while 7,267,900 gallons were discharged to injection well KAFB-7 and 10,323,700 gallons were discharged to injection well KAFB-106IN2.

7.1.2 Extraction Well Performance Metrics

Quarterly extraction well performance data required for DP-1839 compliance reporting is provided in Table 7-1. Average extraction flow rates and drawdown levels are calculated for each extraction well using data that is recorded during operation. These average flow rates and drawdown levels do not

account for readings collected during periods of down time. Well performance graphs are provided in Appendix J-1.

Extraction wells are prioritized for pumping based on their impact on the EDB plume in the IMOA and protection of the municipal water supply wells. Prioritization may occur when one or more wells need to be shut off to perform maintenance on a GWTS treatment train or reduce flow to an injection well to decrease mounding. Based on GWTS performance monitoring and wellhead sampling results, extraction wells KAFB-106228 and KAFB-106239 are the highest priority as they currently have the greatest impact on the reduction of the EDB plume in the IMOA. Well KAFB-106234 is the next highest priority as it serves to capture the distal plume and acts as a hydrologic barrier between the EDB plume in the IMOA and the municipal water supply wells to the northeast. Well KAFB-106233 has minimal impact on EDB plume reduction and is, therefore, the most likely to be deprioritized. The following is a summary of average operational flows and run times in Q2 2021 (Table 7-1):

- Water was extracted from KAFB-106228 at an average operational flow rate of 133.8 gpm with a run time of 97.9 percent.
- Water was extracted from KAFB-106233 at an average operational flow rate of 159.8 gpm with a run time of 97.7 percent.
- Water was extracted from KAFB-106234 at an average operational flow rate of 170.8 gpm with a run time of 97.7 percent.
- Water was extracted from KAFB-106239 at an average operational flow rate of 74.5 gpm with a run time of 97.7 percent.

7.1.3 Injection Well Performance Metrics

Quarterly injection well performance data required for DP-1839 reporting compliance are provided in Table 7-3. Injection well performance figures are provided in Appendix J-1. The following performance data apply to effluent injection in Q2 2021:

- Groundwater was injected into KAFB-7 at an average operational flow rate of 595.9 gpm with a run time of 9.2 percent.
- Groundwater was injected into KAFB-106IN2 at an average operational flow rate of 564.9 gpm with a run time of 10.7 percent.

7.2 Groundwater Treatment System Performance Monitoring

GWTS performance monitoring is performed in conformance with the most recently approved Work Plan (Kirtland AFB, 2017a) and O&M Plan (NMED, 2016; Kirtland AFB, 2016a, 2017d, 2018b). DP-1839 provides additional sampling criteria. Table 2 of DP-1839 provides a list of the compounds that are most frequently monitored at the GWTS (NMED, 2017a). Q2 2021 GWTS analytical performance metrics are discussed in the following sections.

7.2.1 Sampling and Analytical Results

In Q2 2021, water samples from Train 1 (connected to KAFB-106233 and KAFB-106234) and Train 2 (connected to KAFB-106228 and KAFB-106239) were collected monthly from:

- The untreated influent (sample identifications GWTS-BFF-INF1 and GWTS-BFF-INF2 for Train 1 and 2, respectively)
- A port located between the initial and final granular activated carbon (GAC) vessels (sample identifications GWTS-BFF-GAC1 and GWTS-BFF-GAC2 for Train 1 and 2, respectively)
- The treated effluent (sample identifications GWTS-BFF-EFF1 and GWTS-BFF-EFF2 for Train 1 and 2, respectively)

These samples were analyzed for EDB, BTEX, and dissolved iron and manganese. Sample results and effluent discharge limits are provided in Tables 7-4 and 7-5 for Trains 1 and 2, respectively, and are discussed in detail below, as are the samples from the extraction wells (Table 7-6). GWTS performance sample collection logs are provided in Appendix J-3, and analytical data for this quarter and the previous three quarters are provided in Appendix F-3.

7.2.1.1 Influent Sample Results

Concentrations of EDB in the influent samples of Train 1 were below the laboratory detection limit for all samples collected during Q2 2021 (Table 7-4).

Concentrations of EDB were detected in the influent samples of Train 2 below the 0.05 µg/L project screening level at estimated concentrations of 0.011, 0.015, and 0.013 µg/L in April, May, and June 2021, respectively.

BTEX was not detected in influent samples collected from either train during Q2 2021 (Tables 7-4 and 7-5).

Dissolved manganese was not detected in the influent samples collected from Train 1 and was detected below the project screening level in monthly influent samples collected from Train 2 in Q2 2021. Dissolved iron was not detected in monthly influent samples collected from either train.

7.2.1.2 Effluent Sample Results

Concentrations of EDB, BTEX, and dissolved manganese were non-detect in effluent monthly samples collected from either train during Q2 2021. Dissolved iron was detected in the May 2021 effluent sample from Train 2 at an estimated concentration of 0.049 mg/L (Table 7-5).

7.2.1.3 Extraction Well Sample Results

All four extraction wells (KAFB-106228, KAFB-106233, KAFB-106234, and KAFB-106239) were sampled in May 2021 for EDB, BTEX, dissolved iron and manganese, and total metals (calcium, magnesium, potassium, sodium, arsenic, and lead). EDB was detected at an estimated concentration of 0.018 µg/L in the sample from KAFB-106228 (Table 7-6) and was not detected in the sample collected from the other extraction wells. BTEX and dissolved iron were not detected in any extraction well samples. Dissolved manganese was detected below the project screening level only in the sample from

KAFB-106239. Among the total metals analyzed, calcium, magnesium, potassium, sodium, and arsenic were detected below the project screening level in all four extraction wells. Total lead was detected slightly above the project screening level (0.015 mg/L) in the samples from KAFB-106228 and KAFB-106234, and below the project screening level in the samples collected from KAFB-106233 and KAFB-106239.

7.3 EDB Removal

Mass removal for EDB was calculated for both treatment trains by multiplying the monthly influent concentration by the respective total weekly treated volume for the respective treatment train. During this monitoring period EDB concentrations were not observed above the laboratory detection limit within the Train 1 influent, therefore no mass was removed. An estimated 1.18 grams of EDB was captured and removed by Train 2. EDB concentrations and mass removal for Q2 2021 are summarized in Table 7-7.

7.4 Groundwater Treatment System Maintenance and Expansion Activities

Q2 2021 maintenance activities at the GWTS were performed in accordance with the O&M Plan (NMED, 2016; Kirtland AFB, 2016a, 2017d, 2018b) and are discussed in the following sections.

7.4.1 Routine Maintenance Activities

Routine maintenance is any activity described as such in the GWTS O&M Plan. A summary of routine maintenance activities is provided below.

7.4.1.1 Quarterly Routine Maintenance Activities

During Q2 2021, effluent bag filters for Train 2 were replaced on June 17, 2021. The Train 1 effluent bag filters were not replaced as they did not reach the differential pressure of 4 pounds per square inch (psi) required for replacement by the GWTS O&M Plan. Train 1 influent bag filters were replaced on June 16, 2021, and Train 2 influent bag filters were replaced on May 20, 2021.

The differential pressure at the initial GAC vessel on Train 1 was 2.8 psi on April 1, 2021, and, on June 30, 2021, the differential pressure was 3.1 psi (Daily and Weekly Inspection Logs within Appendix J-1). The differential pressure at the initial GAC vessel on Train 2 was 6.1 psi on April 1, 2021, and, on June 30, 2021, the differential pressure was 7.8 psi.

In Q2 2021, the influent basket strainers were cleaned 14 times for Train 1 and 15 times for Train 2. The effluent Wye strainers were cleaned three times for both trains. Wye strainers/basket strainers were cleaned to maintain equalization of the influent tanks and prevent cavitation at the influent pump intakes as they accumulate biologic materials coming in with the influent.

The GWTS routine maintenance schedule is provided in Table 7-8, and non-routine maintenance activities that were performed during Q2 2021 are discussed in Section 6.3.3 and in Table 7-9.

7.4.2 Conveyance Line Security and Administrative Controls

Kirtland AFB is registered as a line-owner with New Mexico 811 for the off-Base portion of the conveyance lines. U.S. Air Force permits are required for all on-Base excavation projects, and, during the quarter, Kirtland AFB responded to 12 off-Base tickets requested through New Mexico 811 (Appendix J-2). There were no conveyance line breaches, and all off-Base conveyance lines remained intact.

7.4.3 Non-Routine Maintenance Activities

Non-routine maintenance activities are defined as maintenance items that fall outside the scope of the GWTS O&M Plan but need to be addressed to maintain consistent GWTS operation. A summary of shutdowns associated with non-routine maintenance activities occurring during Q2 2021 is provided on Table 7-9. Major non-routine maintenance performed in Q2 2021 is described in the following paragraphs.

On April 8, 2021, KAFB-106239 went offline for approximately 35 minutes due to an overcurrent on the variable frequency drive (VFD). The treatment plant operator responded to the alarm and reset the VFD. Upon reset, the well pump was restarted and monitored to ensure amperage draw was within the manufacturer specified range.

On April 13, May 25, and June 8, 2021, the GWTS was shut down for testing on the uninterrupted power supply. This is done to ensure that all backup power supplies are functioning properly in the event of an unexpected system shutdown.

On April 16, 2021, the GWTS was shut down due to a faulty level transducer within injection well KAFB-106IN2. The GWTS treated effluent was directed to well KAFB-7, and the system was restarted. The fault level transducer was replaced on April 29, 2021.

From April 26 to April 29, 2021, the GWTS was offline intermittently for the conditioning of injection well KAFB-106IN2. The injection well conditioning consisted of a series of backwash and injection cycles that are performed to remove formational plugging in the subsurface and return capacity to the injection well.

Backwash cycles consisted of backwashing (pumping groundwater) the injection at a flow rate that is greater than the injection flow rate to remove sediment and condition the flow pathways in the subsurface. Water purged from the well during the backwash cycles was transferred to the GCMP via the effluent conveyance line. Backwash cycles consisted of backwashing (pumping groundwater) the injection at a flow rate that was greater than the injection flow rate to remove sediment and condition the flow pathways in the subsurface. Water purged from the well during the backwash cycles was transferred to the GCMP via the effluent conveyance line. Injection cycles consisted of the injection of treated effluent water into the well at the plant operational flow rate. Injection cycles consisted of the injection of treated effluent water into the well at the plant operational flow rate.

A total of 27 backwashing cycles and 7 injection cycles were performed during the well conditioning program, resulting in an increase of the injection specific capacity from 12.67 gpm per foot of screen to 29.06 gpm per foot of screen when injection well KAFB-106IN2 was placed back in service. The daily quality control reports for well conditioning are provided in Appendix J-1.

On June 22, 2021, there was a break in at the electrical shed associated with KAFB-106228. The pump was consequentially shut down overnight but was restarted by the morning of June 23, 2021. Additional locks and tamper resistant lock hasps were installed on the electrical shed to minimize the potential for future incidents.

On June 26, 2021, a power surge shut down wells KAFB-106233, KAFB-106234, and KAFB-106239. The power surge caused the wells pumps to be placed in standby condition instead of failed, and, as a result, no alarms were delivered. The issue was observed by the GWTS operation team during remote system inspections, and the well pumps were restarted.

7.5 Planned Work for the Upcoming Performance Period

O&M of the GWTS will be performed in accordance with the approved O&M Plan and Work Plan. At this time, no large item repairs or replacements are expected to occur during the upcoming quarter.

7.6 Summary of Public Meetings

A virtual public meeting was held on April 22, 2021, and included an update on the current state of the GWTS and discussions of pilot and shallow soil vapor studies associated with the Kirtland AFB BFF. The meeting lasted approximately 1.5 hours and included 58 attendees from the community including project personnel, stakeholders, elected officials, media members, and the general public.

8. INVESTIGATION-DERIVED WASTE

During Q2 2021, both hazardous and non-hazardous IDW were generated. This section discusses the details of waste generated, disposed of, and managed during the quarter.

The following activities generated IDW that was managed at the BFF site during Q2:

- GWM activities that generated both hazardous and non-hazardous liquid waste
- Activities related to pumping wells, injection wells, and new monitoring wells that generated non-hazardous waste
- Non-hazardous solid IDW from the GWTS operation and monitoring well installation

8.1 Non-Hazardous Investigation-Derived Waste

Non-hazardous IDW liquid waste was generated from quarterly GWM sampling activities and activities associated with well drilling and maintenance. Appendices K-1 and K-2 provide specific information regarding the non-hazardous liquid and solid IDW generated and disposed of during Q2 2021.

8.1.1 Groundwater Monitoring Liquid Investigation-Derived Waste

Non-hazardous IDW purge water collected during sampling of the GWM wells was placed in 55-gallon plastic drums. The drums were sealed with matching plastic lids with steel locking-ring collars, labeled with vinyl non-hazardous waste labels, and transferred to the designated non-hazardous IDW yard located on Kirtland AFB. Small volumes of IDW water, typically generated from passive sampling devices or sampling of drinking water wells, were placed in labeled, 5-gallon plastic buckets (pails) with sealing lids.

Eligibility for discharge of non-hazardous liquid IDW to the GWTS was determined by comparing historical, well-specific data from the previous two quarters to the acceptance criteria of the GWTS. Liquid IDW from monitoring wells that had historically met the GWTS acceptance criteria was discharged to the facility without further review. Liquid IDW sourced from wells with historical data from the previous two quarters that exceeded the GWTS acceptance criteria or displayed variations in data that warranted further reviews was held for further evaluation.

For Q2 2021, 890.25 gallons of non-hazardous water was generated from standard GWM activities and disposed of at the GWTS (Appendix K-1, Table K-1-1). A total of 358 gallons of non-hazardous liquids was disposed of at the GWTS from other sources in Q2 2021 (Appendix K-1, Table K-1-2). This waste met the GWTS acceptance criteria, was processed through the GWTS, and was discharged to the GCMP (Appendix K-1, Tables K-1-1 and K-1-2).

Some liquid IDW approved for GWTS disposal, but not yet processed through the GWTS due to scheduling constraints, GWTS discharge limitations, and/or O&M activities, is held until it can be disposed of properly. These liquids are held in the "Pending Disposal" area of the IDW yard. At the end of Q2 2021, no water originating from GWM and GWTS maintenance activities was present in this category (Appendix K-1, Table K-1-3).

Non-hazardous liquid IDW that was collected but held pending receipt and evaluation of analytical data to determine if it met GWTS acceptance criteria was placed in the "Pending Analysis" area of the IDW

yard. At the end of Q2 2021, there was one drum containing 7 gallons of liquid in this area (Appendix K-1, Table K-1-4).

8.1.2 Non-Hazardous Drilling Liquid Investigation-Derived Waste

In Q2 2021, 8,380 gallons of non-hazardous drilling-related liquid IDW was disposed of through the GWTS. This IDW was generated during Q1 2021 drilling and development of monitoring well activities. The liquids that met disposal criteria were processed through the GWTS (Appendix K-1, Table K-1-5).

8.1.3 Non-Hazardous Well Drilling Liquid Investigation-Derived Waste Pending Disposal

There were no non-hazardous drilling-associated liquids held as "Pending Disposal" or "Pending Analysis" at the end of the quarter (Appendix K-1, Tables K-1-6 and K-1-7).

8.1.4 Non-Hazardous Solid Waste

When solid waste is generated during the quarter, it is held in either 55-gallon steel drums with steel tops and locking rings or, depending on the total volume, in 20-yard capacity roll-off bins. Bin doors are sealed with an expanding foam to minimize the potential of leaks, and the bins are double lined with 10-millimeter plastic liners. Either integrated hard cover tops with ratcheting straps or removable, heavy-duty vinyl covers that are secured to the bin using heavy-duty rubber straps are used to protect the contents from weather or access by local fauna. Drums are placed on secondary containment pallets, and roll-off bins are placed on secondary containment composed of plastic sheeting with berm or rolled edges.

No non-hazardous solid waste was generated from GWM operations during Q2 2021 (Appendix K-2, Table K-2-1).

Approximately 0.24 cubic yards of waste salt that was generated from GWTS operations during Q1 2021 was disposed of during the current quarter. This waste was held in the "Pending Disposal" category until an appropriate off-Base disposal pathway was identified. The waste was transported by ACTenviro to the US Ecology disposal site in Nevada under manifest #D356879 (Appendix K-2, Table K-2-2).

Routine, non-hazardous solid waste was generated during GWM activities. This included various disposable field equipment and materials such as single-use dual membrane samplers, disposable in-line filters, nitrile gloves, and paper trash. These items were disposed of as municipal solid waste, and volumes were not tracked.

8.1.5 Non-Hazardous Well Drilling Solid Investigation-Derived Waste

During Q2 2021, non-hazardous soil was generated and managed during the drilling and development of six GWM wells. Drilling operations were managed by both EA and Sundance Consulting, Inc. (Sundance) during this period. Drilling-related waste was managed at independent IDW yards for each company. During Q2 2021, no solid IDW was held in the "Pending Disposal" status at the end of the quarter (Appendix K-2, Table K-2-3).

A total of 207.5 cubic yards of soil (drill cuttings) was disposed of during Q2 2021 (Appendix K-2, Table K-2-4). Roll-off bins containing non-hazardous soil were authorized by Kirtland AFB personnel for disposal at the Kirtland AFB Construction and Demolition landfill. Of the total volume, 102.5 cubic yards was managed by EA, and Sundance managed the disposal of 105 cubic yards of soil.

8.1.6 Special Waste Well Drilling Solid Investigation-Derived Waste

Special waste is defined as petroleum-contaminated soil that contains total petroleum hydrocarbons at concentrations greater than 100 milligrams per kilogram (Subparagraph [i] of Paragraph [13] of Subsection S of NMAC 20.9.2.7 (NMAC, 2011). No special waste was generated or disposed of during Q2 2021 (Appendix K-2, Table K-2-5).

8.2 Hazardous Investigation-Derived Waste

Hazardous or potentially hazardous IDW was accumulated in one of two less than 90-day RCRA accumulation areas associated with the Kirtland BFF Project. Hazardous waste generated from routine GWM sampling or well maintenance activities (purge or well rehabilitation water) was placed in the Kirtland BFF less than 90-day RCRA accumulation area. Hazardous or potentially hazardous waste generated during drilling activities was held in the Kirtland AFB Zia Park temporary less than 90-day RCRA accumulation area.

The hazardous or potentially hazardous waste was held pending final waste determination. Hazardous waste determination is based on either analytical confirmation data or by generator knowledge. If the waste was verified to be hazardous, the IDW would remain in this accumulation area until it was removed from Kirtland AFB and properly disposed of off-Base. If the IDW was determined to not meet hazardous waste criteria, it was recategorized as non-hazardous and transferred to the "Pending Disposal" area of the non-hazardous IDW yard.

All hazardous waste must be removed from Kirtland AFB and properly disposed of off-Base within the required 90-day accumulation time limit. Hazardous waste was transported off Kirtland AFB only after it was properly profiled, manifested, and approved for transport by Kirtland AFB. Waste was transported by a licensed hazardous waste hauler to a permitted treatment, storage, and disposal facility. Manifests for waste disposed in Q2 2021 are in Appendix K-3.

8.2.1 Liquid Hazardous Investigation-Derived Waste

Prior to the start of the Q2 2021 GWM sampling event, an evaluation was made to identify monitoring wells that were anticipated to generate characteristically hazardous liquid IDW. This evaluation flagged wells that required purge water to be managed as "hazardous" from the point of generation and assisted in the initial waste segregation. Based on historical analytical data for each well, the water was suspected to be characteristically hazardous if the concentration of benzene exceeded 500 µg/L (per 40 CFR Part 261.24). The hazardous waste classification code for waste containing benzene is D018.

For monitoring wells located in the source area of the groundwater plume that show consistent data to indicate the purge water to be hazardous, "Generator Knowledge" was used for hazardous waste determination per RCRA regulations 40 CFR 262.11(d)(1).

Liquid hazardous waste originating in purging of wells prior to sampling or during well development was placed in 55-gallon steel drums with steel tops and locking rings (UN designation 1A2/Y1.2/100/**). When small volumes (less than 5 gallons) of waste were generated at a well, a plastic container with a threaded top (jerrican) was used to contain the liquid. The jerrican was then placed in a 55-gallon steel drum for additional security. Waste containers were properly labeled, sealed, and placed on secondary containment pallets located within the appropriate less than 90-day RCRA accumulation area. The accumulation areas and waste containers were inspected on a weekly basis by trained personnel as required under 40 CFR 262.34.

When possible, liquid hazardous waste was consolidated. This was typically done to combine small volumes of waste generated during passive sampling activities at multiple well sites. Consolidation was also performed to reduce the total number of drums that require off-Base disposal.

A total of 172 gallons of liquid hazardous waste was disposed of during Q2 2021 (Appendix K-3, Table K-3-1); all this waste was generated during GWM activities. Clean Earth provided transportation of the waste from Kirtland AFB to Chemical Reclamation Services, LLC in Avalon, Texas, a permitted hazardous waste disposal facility (Appendix K-3).

There was no liquid hazardous waste held in the "Pending Disposal" category at the end of Q2 2021 (Appendix K-3, Table K-3-2a).

8.2.2 Solid Hazardous Investigation-Derived Waste

Solid (soil) waste is determined to be hazardous if it contains benzene at concentrations equal to or greater than the RCRA characteristic regulatory limit of 5.0 milligrams per kilogram. Based on the extensive history of analytical data from SWMUs ST-106/SS-111, no other organic or inorganic characteristic hazardous waste compounds are applicable to this site.

At the end of Q2 2021, there was no hazardous soil drilling waste held in the "Pending Disposal" category (Appendix K-3, Table K-3-2b).

8.2.3 Hazardous Investigation-Derived Waste Volume Year-to-Date Totals

Appendix K-3, Table K-3-3 summarizes the quarterly total volume of liquid hazardous waste disposed of from the Kirtland AFB BFF through Q2 2021. As of the end of Q2 2021, the total liquid hazardous waste disposed of on the Kirtland BFF Project in 2021 was 571 gallons. There was no solid (soil) hazardous waste generated or disposed of during Q1 or Q2 2021.

9. DEVIATIONS

9.1 Soil Vapor Monitoring

The soil vapor sample at SVMP KAFB-106139-250 was retaken on May 11, 2021, due to an inoperable Summa cannister with a stuck valve that prevented the laboratory from accessing the sample. The soil vapor samples at KAFB-106V3-007, KAFB-106V3-015, and KAFB-106V3-272 were retaken on June 24, 2021, as confirmation samples to compare to the initial analytical results at these new SVMPs.

9.2 Groundwater Monitoring

GWM deviations associated with gauging, groundwater sampling, or the interim measure are discussed below.

9.2.1 Groundwater and Light Non-Aqueous Phase Liquid Gauging

Gauging was not conducted at three wells during Q2 2021. At wells KAFB-106063 and KAFB-106064, gauging was not conducted during the synoptic gauging period due to dedicated sampling equipment in the wells. KAFB-106063 was gauged prior to sampling, and the water level is presented in this report for informational purposes only and was not used in analysis. Gauging was attempted at KAFB-106064 prior to sampling, but the dedicated downhole equipment prevented the interface probe from reaching the water level. KAFB-106252-515 is a piezometer in a new nested well location and was not included in the schedule for Q2 2021. These three wells will be gauged quarterly beginning in Q3 2021.

9.2.2 Groundwater Sampling

No groundwater sampling deviations occurred during Q2 2021.

9.3 Drinking Water Production Well Sampling

Samples were not collected from KAFB-016 in May or June 2021 as the well was being repaired. Sampling will be resumed after repairs are completed.

9.4 Interim Measure Operation and Monitoring

There were no deviations in the operation and monitoring of the interim measure during Q2 2021.

10. CONCLUSIONS AND RECOMMENDATIONS

10.1 Soil Vapor Data Interpretation

10.1.1 Field Monitoring and Analytical Conclusions

In the on-Base, outside of the Source Area AOI, the low O_2/high CO_2 environment indicates rate-limiting conditions for aerobic microbial activity and that aerobic biodegradation may be occurring at less-than-optimal conditions.

The bioventing pilot study, which had been ongoing in the source area, was terminated on November 23, 2020. In the Source Area AOI in Q2 and Q4 2020, all but three SVMPs reported O_2 levels greater than 5 percent, most likely a result of the bioventing pilot study being carried out in the area during that time. Now that bioventing activities have ceased, O_2 levels may again be dropping, with eight SVMPs registering O_2 levels below 5 percent in Q2 2021.

Results in the on-Base AOI located outside of the Source Area were consistent with previous sampling events. The highest soil vapor concentrations reported in this AOI were located adjacent to the source area and above the groundwater benzene plume.

Results in the off-Base AOI were consistent with previous sampling events with the highest soil vapor concentrations reported at 450 ft bgs.

10.1.2 Shallow Soil Vapor Comparison to NMED VISLs

The shallowest SVMPs at SWMUs ST-106/SS-111, screened from 7 to 25 ft bgs, were compared to NMED VISLs as a first-tier screening level (Table 10-1). As discussed in Section 2.1, the RCRA Permit (NMED, 2010) does not define regulatory project screening levels for soil gas samples collected from SVMPs. NMED VISLs were calculated using attenuation factors applied to EPA's indoor air screening levels. VISLs are intended to be screened against soil gas samples collected from below building foundations (EPA, 2015), however, no occupied buildings are present in the Source Area. NMED VISLs are used as a first-tier screening level in this report in accordance with NMED requirements in the comments to the Quarterly Monitoring Report for April-June 2019 dated July 2020 (NMED, 2020b), which is provided in Appendix A-1.

10.1.2.1 Off-Base Shallow SVMP VISL Exceedances

One nominal 25-ft SVMP in the Off-Base AOI, KAFB-106142-030, had a naphthalene detection of 32 µg/m^3, which exceeded the NMED Residential Soil Gas VISL (27.5 µg/m^3). This soil vapor point is located north of the Bullhead Park parking lot and not located near residential or commercial structures. In addition, the detection is inconsistent with historical data, and a naphthalene detection without high concentrations of any other fuel related compounds indicates that this detection is likely not attributable to the fuel release. However, this location will continue to be monitored in future sampling events (Table 10-1).

10.1.2.2 On-Base, Outside of the Source Area Shallow SVMP VISL Exceedances

The results of the first sampling event performed at KAFB-106V3 indicated that concentrations of both EDB and benzene exceeded their respective VISLs (1.56 µg/m^3 and 120 µg/m^3). KAFB-106V3 is a new soil vapor well that was installed in November 2020. The results of the first sampling event indicated

concentrations of 6.8 µg/m^3 EDB and 260 µg/m^3 benzene in the 7-ft screen and 12 µg/m^3 EDB and 160 µg/m^3 benzene in the 15-ft screen interval. The location is adjacent to, but not inside of, the historical excavation area. While the detections exceed the NMED Residential Soil Gas VISLs, only the EDB detection of 12 µg/m^3 at KAFB-106V3-015 exceeds the NMED Industrial Soil Gas VISL (7.65 µg/m^3). Neither benzene detection exceeds the NMED Industrial Soil Gas VISL (588 µg/m^3).

This location was resampled on June 24, 2021. Laboratory results from KAFB-106V3-007 were non-detect for EDB and below the NMED Residential Soil Gas VISL for benzene. Laboratory results from KAFB-106V3-015 were non-detect for both EDB and benzene (Table 10-1). The higher results from the first sampling event may be the result of displacement of soil vapor due to the high pressures exerted on the soils by the air rotary drilling techniques employed in the construction of this well shortly before the initial Q2 2021 sampling event. If this is the case, the June 2021 resampling data is more indicative of a return of contaminant concentrations to equilibrium around this wellbore. These SVMPs will continue to be monitored.

Samples collected from three shallow SVMPs (KAFB-106132-025, KAFB-106133-025, and KAFB-106135-025), centered around the Air National Guard facility and approximately 750 ft east-northeast of the source area, contained trichloroethene at concentrations in exceedance of the VISL (69.5 µg/m^3). These detections are likely related to Area of Concern SS-400, a recently established chlorinated solvent site in the vicinity of the Air National Guard facility (NMED, 2020c).

Three compounds had detections exceeding the residential soil gas VISL in the vicinity of the former fuel tanks. Bromodichloromethane exceeded the residential soil gas VISL at six locations in the vicinity of the former fuel tanks in the BFF, with a maximum detected concentration of 270 µg/m^3 at KAFB-106123-025. Chloroform exceeded the residential soil gas VISL at eight locations around the former fuel tanks, with a maximum detection of 1,300 µg/m^3 at KAFB-106124-025. Naphthalene also exceeded the residential VISL, with a detection of 37 µg/m^3 at KAFB-106123-025. Due to their location, including sample depth and distance from buildings, these detections are not considered to be related to the BFF release and do not require additional investigation at this time.

10.1.2.3 On-Base, Inside the Source Area Shallow SVMP VISL Exceedances

There are no SVMPs within the nominal 25-ft depth interval within the source area.

10.2 Groundwater Data Interpretation

10.2.1 Aquifer Conditions

The horizontal groundwater gradient within the monitoring network is dominated by radial flow patterns toward depressions in the water table created by groundwater extraction wells. Water levels across the site rose in the first half of 2021, resulting in an average water level increase of 1.25 ft since Q4 2020. More recently, water levels decreased by 0.02 ft between the first and second quarters of 2021.

Water levels have been rising across the site since 2008, when the San-Juan Chama Drinking Water Project became operational and the quantity of groundwater used by the City of Albuquerque decreased. The recent decline observed in 2021 may be attributed to additional City of Albuquerque and Kirtland AFB production well pumping due to drought conditions.

10.2.2 Light Non-Aqueous Phase Liquid

During gauging, LNAPL was detected and measured in five wells located on-Base within the Source Area Plume (KAFB-106005, KAFB-106059, KAFB-106076, KAFB-106150-484, and KAFB-106154-484), consistent with previous quarters (Table 10-2). LNAPL thickness ranged from 0.01 ft in KAFB-106005, KAFB-106059, and KAFB-106076 to 0.39 ft in KAFB-106150-484 (Figure 5-4).

The historical extent of LNAPL has decreased since GWM began. LNAPL detections since 2011 are presented on Table 10-2. Within the past 5 years, the extent of LNAPL detections has been only at on-Base locations, with the majority of detections within the past year located within or immediately adjacent to the BFF (Figure 5-4).

Each of the wells with historical LNAPL detections is either screened across the water table or is located in close proximity to a well that is currently screened across the water table. In some of these locations, the well sampled was installed within the past two years to fill a previous data gap created by the rising water table that submerged screens across the monitoring network. The newer water table wells provide additional data points to assist with the analysis of conditions at the water table.

10.2.3 Dissolved-Phase EDB and BTEX Plumes

The bulk of EDB and BTEX concentrations in excess of their respective MCLs occurs in REI 4857 south of Ridgecrest Drive SE (Figures 5-5 through 5-10). Only four EDB exceedances of the MCL were detected within the IMOA, in REIs 4857 and 4838; however, the northern plume appears slightly larger than historical depictions. This is due to extraction well KAFB-106234 operating as designed. This mass will eventually be captured by this extraction well (Figure 5-5) because the capture analysis indicates that the plume is 100 percent captured by the IM (see Section 10.4). Note that Figure 5-5 utilizes the primary sample value of 0.019 J µg/L for well KAFB-106225 (Table 5-5) because the primary results are used in the discussion of analytical results, while duplicate results are used for quality control purposes. The duplicate value of 0.041 µg/L was utilized for the modeling discussed in Section 10.4.1 in order to present the most conservative value. Benzene concentrations in excess of the MCL were not detected north of Ridgecrest Drive SE in Q2 2021.

10.3 Drinking Water Supply Well Data Interpretation

Drinking water supply well organic and inorganic analytical data are provided in Tables 6-1 and 6-2, respectively. Consistent with previous monitoring events, no detectable concentrations of EDB or BTEX were observed in the drinking water supply well samples in Q2 2021 (Table 6-1).

10.4 Interim Measure Operation Data Interpretation

The pump-and-treat interim measure to contain the dissolved-phase EDB groundwater plume is being implemented pursuant to the corrective action provisions in Part 6 of Kirtland AFB's RCRA Permit. As discussed above, this interim measure focuses on the collapse and treatment of the dissolved-phase EDB concentrations in groundwater that extend north of Ridgecrest Drive SE, the IMOA. It does not address dissolved-phase EDB or other fuel-related constituent concentrations present in the source area located south of Ridgecrest Drive SE. The fuel release-related contamination south of Ridgecrest Drive SE will be comprehensively addressed in the Corrective Measures Implementation phase once the final remedy for the source area has been selected by NMED.

The principal goals of the groundwater interim measure are to:

- Collapse the dissolved-phase EDB plume within the IMOA, which includes reducing the volume and EDB mass over time

- Halt plume expansion in the dissolved-phase EDB plume in the IMOA and provide protection to water supply wells by hydraulic capture of the dissolved-phase EDB utilizing well pumping

Measuring the attainment of these goals during implementation of both the interim measure and the final remedy is referred to as performance assessment.

Defining the effectiveness of the interim measure in achieving the first goal of collapsing the plume is performed by analyzing groundwater samples for the presence and concentration of EDB and interpolating the extent of the plume based on these analyses. Groundwater samples are collected and analyzed in Q2 and Q4 of each year, and the plume volume and mass are interpolated for each sampling period. In this way, the effect of interim measure extraction on the extent of the plume can be observed and quantified. This analysis also provides a domain against which the interim measure's capture potential (second goal) can be evaluated.

The second goal, referred to as plume capture by EPA (EPA, 2008) and in this report, provides mitigation of impact to receptors prior to implementation of the final remedy. Performance assessment of the EDB pump-and-treat interim measure is performed in Q2 and Q4 of each year using the EPA Systematic Approach for Evaluation of Capture Zones at Pump and Treat Systems (EPA, 2008). Performance assessment, consisting of multiple lines of evidence including numerical modeling, was approved by NMED on April 23, 2018 (NMED, 2018c) in resolution of the modeling component of the Notice of Deficiency issued to Kirtland AFB on November 16, 2017 (NMED, 2017d).

EPA (2008) highlights six key steps for systematically performing a capture zone evaluation (detailed in Section 6.4.2). Quoting from this document:

> *Specific techniques to interpret the extent of capture achieved by the ground-water extraction are applied in Steps 3 to 5. Each of these techniques is subject to limitations, and in most cases, no single line of evidence will conclusively differentiate between successful and failed capture. Therefore, developing "converging lines of evidence," by applying multiple techniques to evaluate capture, increases confidence in the conclusions of the capture zone analysis.*

This section details the evaluation of the volume and mass of the dissolved phase EDB plume in the IMOA, referred to as the target capture zone (TCZ). The evaluation relies on field sampling results and assesses TCZ capture based on current water level measurements and concentration trends. The efficiency of the interim measure extraction network is quantified by first determining the volume and mass of the current TCZ that is captured under the current hydrogeologic conditions by the interim measure extraction network, then the remaining TCZ volume and mass not captured is compared to the initial TCZ volume and mass as defined by the Q4 2016 TCZ delineation. The capture under current conditions is presented as a percentage of the initial TCZ volume and mass, which was the design objective for the extraction network. The results from this analysis estimates 100 percent capture of the volume and mass of the initial TCZ by the interim measure extraction system under Q2 2021 conditions.

Specific lines of evidence used to assess the TCZ include:

- Interpretation of collected water level data
- Evaluation of concentration trends

This performance assessment is a snapshot of the system's performance at the time of the synoptic gauging event and is designed to evaluate point-in-time capture produced by the interim measure extraction system. It does not provide an integrated assessment of capture throughout Q2 2021, and it is not intended to be a final remedy evaluation.

10.4.1 Plume Collapse Analysis

This section describes the analyses designed to quantify the distribution of dissolved-phase EDB mass and volume within the aquifer over the course of the interim measure. The interim measure goal is to reduce the mass and volume of contaminated media by containing, capturing, and treating contaminated groundwater in the IMOA.

As discussed in Section 5, the IMOA for the groundwater interim measure is the distal section of the EDB plume located north of Ridgecrest Drive SE. The TCZ within the IMOA is defined in accordance with EPA 2008 guidance. The definition used by EPA defines the TCZ as the three-dimensional (3D) zone of groundwater that must be captured by the remedy extraction wells for the hydraulic containment portion of the remedy to be considered successful. The 3D zone of groundwater that must be captured by the interim measure extraction wells (i.e., the TCZ) is defined as the MCL for dissolved EDB, 0.05 µg/L. The iso-shell delineating the cleanup standard is defined as the 3D polygon with a periphery concentration of 0.05 µg/L. Collapse of the TCZ is the long-term goal; therefore, establishing a consistent method of measurement that allows comparison of plume mass and volume trends over the duration of cleanup activities is essential.

The effectiveness of the interim measure is evaluated by comparing the most recent dissolved-phase EDB delineation with past delineations. EDB concentration data are collected and analyzed from the full GWM network in Q2 and Q4 of each year. Therefore, dissolved-phase EDB delineations are updated on this schedule, and plume comparisons are presented in the reports associated with these quarters. All delineation updates are performed using the same methodology with the only variations being the insertion of the current EDB concentration data, addition of any new monitoring wells since the last assessment, and allowance of volume variation due to resetting the plume upper surface to the current water table surface. The EDB iso-shell was simulated in three dimensions and is only used for TCZ analysis purposes in this section. Plume delineations discussed in Section 5 are based on two-dimensional interpolations of specific REI concentration measurements in order to graphically illustrate the individual measurements without the projection of overlying or underlying concentration data. Figures 5-5 (REI 4857) and 5-6 (REI 4838) represent the EDB plume manually interpolated using the measured monitoring data collected in Q2 2021. All EDB concentrations presented in Figure 5-7 (EDB in REI 4814) are non-detect.

Figure 10-1 shows the interpolated TCZ delineations for the last four synoptic measuring periods, as well as the TCZ delineation for Q4 2016 for baseline comparison. The TCZ volume changes between measuring periods as a result of the changing regional water table and interim measure extraction activity. The volume and mass of the TCZ is calculated for each assessment period shown in Figure 10-1, and the values are listed in Table 10-3.

As can be seen in both Figure 10-1 and Table 10-3, the volume and mass of the TCZ have reduced significantly over time. In Q4 2016, 15 months after the first interim measure extraction well KAFB-106228 became active, the TCZ volume and mass were estimated at 1.15E+08 cubic ft and 103.94 grams, respectively. Both of these values have been on a decreasing trend over the last 5 years with the current plume volume and mass estimated at 1.02E+07 cubic ft and 4.8 grams, respectively. This represents a 91.1 percent decrease in TCZ volume and a 95.3 percent decrease in TCZ mass from Q4 2016.

Figure 10-2 shows a cross-section comparison of the TCZ extent in Q4 2020 and Q2 2021. The plume has been cut along the T1A transect that, in general, runs along the longitudinal axis of the plume from southwest to northeast. The plume is shown transparent against the stratigraphic layers of the saturated portion of the aquifer along this transect developed by AECOM (2016) so that the shape and movement of the plume can be compared to the location and extent of coarse-grained (white) and fine-grained (gray) lithology as coarse-grained sediments are generally more permeable and conductive and may provide pathways for plume movement.

Beginning in Q2 2019, the plume collapse analysis was modified to focus on dissolved-phase EDB mass and volume changes solely for the TCZ, the plume extent in the IMOA. East-west transect intervals were started at, and were oriented parallel to, Ridgecrest Drive SE. The total number of analysis intervals was reduced from 11 to 6 (A through F) (Figure 10-2). Both Figure 10-2 and Table 10-3 list the volume and mass of each interval and summarize these for total TCZ plume characterization. In order to retain mass and volume change comparisons, the modified analysis was repeated on dissolved-phase EDB plumes derived for Q4 2016 through Q2 2018 performance assessments. Figure 10-2 shows a graphic comparison of the Q4 2020 and Q2 2021 analyses, while Table 10-3 summarizes the analysis comparisons from Q4 2016 to Q2 2021. The dissolved-phase EDB mass values (in grams) assume a uniform total porosity of 25 percent for the contaminated thickness of the aquifer.

In Q2 2021, the total mass in the TCZ decreased by 0.4 grams from 5.2 to 4.8 grams. The decrease in mass is due to the removal of a significant portion of the mass that had collected around interim measure extraction well KAFB-106228. The decrease in plume mass around KAFB-106228 is due to a decrease in measured dissolved EDB concentrations, compared to Q4 2020 measurements, in five monitoring wells (Table 5-6): EDB in KAFB-106035 decreased from 0.06 to 0.031 parts per billion (ppb), EDB in KAFB-106036 decreased from 0.12 to 0.09 ppb, EDB in KAFB-106037 decreased from 0.059 ppb to below detection, EDB in KAFB-106089 decreased from 0.074 to 0.048 ppb, and EDB in KAFB-106243-425 decreased from 0.042 to 0.03 ppb. Interpolation based on these concentration decreases resulted in a total mass decrease for interval A of 0.5 grams (from 1.7 to 1.2 grams), for interval B of 1.9 grams (from 2.2 to 0.3 grams), and for interval C of 0.6 grams (from 0.7 to 0.1 grams) as shown in Figure 10-2 and Table 10-3.

The reduction in mass around KAFB-106228 is offset by an estimated increase in mass associated with the isolated plume segment located south of interim measure extraction well KAFB-106234 (Figure 10-2). The increase in plume mass in this location is due to an increase in measured dissolved EDB concentrations, compared to Q4 2020 measurements, in three monitoring wells (Tables 5-5 and 5-6): EDB in KAFB-106041 increased from 0.074 to 0.098 ppb, EDB in KAFB-106042 increased from 0.043 to 0.056 ppb, and EDB in KAFB-106225 increased from 0.017 to 0.041 ppb. Interpolation based on these concentration increases resulted in a total mass increase for interval D of 1.9 grams (from 0.7 to 2.6 grams) and for interval E of 0.6 grams (from 0.0 to 0.6 grams) as shown in Figure 10-2 and Table 10-3. The increase in concentration in monitoring well KAFB-106225 indicates that the mass in this plume segment is migrating towards extraction at interim measure well KAFB-106234. It should be noted that the primary sample from KAFB-106225 had an estimated concentration of 0.019 ppb, but the higher value from the field duplicate sample was used in this analysis.

This analysis shows that the interim measure has collapsed the TCZ over the last 5 years and is currently containing the remaining mass with the bulk of the remaining volume and mass north of Ridgecrest Drive SE being located south of interim measure well KAFB-106234, or present just north of Ridgecrest Drive SE as an extension of the Source Area Plume. Overall, the plume analysis reveals the general pattern of dissolved-phase EDB volume and mass response expected due to interim measure system extraction.

10.4.2 Plume Capture Evaluation

As described in Section 10.4, one of the goals of the interim measure is to halt the migration of the EDB plume toward municipal drinking water wells. The degree to which the interim measure is achieving this goal is defined by performing a capture evaluation during each assessment period. The subsections below describe the methods and results of the capture evaluation being utilized to assess the effectiveness of the interim measure. The evaluation follows EPA capture evaluation guidelines defined as a six-step process (EPA, 2008):

- Step 1: Review site data, site conceptual model, and remedy objectives
- Step 2: Define site-specific TCZ
- Step 3: Interpret water levels
    - Potentiometric surface maps (horizontal capture)
    - Water level difference maps (vertical capture)
    - Water level pairs (gradient control points)
- Step 4: Perform calculations
    - Estimate flow rate calculation
    - Capture zone width calculation
    - Modeling (analytical or numerical) to simulate water levels, in conjunction with particle tracking and/or transport modeling
- Step 5: Evaluate concentration trends
- Step 6: Interpret actual capture based on Steps 3 through 5, compare to TCZ, and assess uncertainties and data gaps

As defined by EPA, a "Capture Zone" refers to the 3D region in an aquifer system that contributes the groundwater extracted by one or more wells (EPA, 2008). The purpose of the performance assessment is to assess hydraulic containment produced by each interim measure extraction well at a single point in time (period of gauging) and compare it to the TCZ (dissolved EDB concentrations above the MCL). The percentage of the plume contained will be identified as captured, meaning that if conditions do not change, the contained portion of the plume will eventually flow to the extraction well and be removed from the aquifer. The terms "capture" and "contained" are used interchangeably representing the above definition.

Steps 3 through 5 represent techniques for systematically evaluating capture and each has limitations, meaning that no single line of evidence will conclusively differentiate between successful and failed capture. Therefore, in order to increase the confidence in the conclusions of a capture zone analysis, multiple techniques are applied so that converging lines of evidence can be developed. This section

describes the methods and results for each line of evidence used to evaluate dissolved-phase EDB capture at Kirtland AFB BFF. Descriptions of the methodologies utilized are provided in Appendix B-3.

10.4.2.1 Step 1: Review Site Data, Site Conceptual Model, and Remedy Objectives

EPA (2008) identifies four prerequisites for establishing meaningful TCZs. These prerequisites are cited below, followed by responses to the posed questions.

1. *Is the plume adequately delineated in three dimensions?*

   Yes, plume delineation is accomplished through the GWM network gauging and sampling activities described in Section 5, along with the gauging of 32 wells that are not in the GWM network (Appendix H-2). In Q2 2021, the groundwater level and water chemistry monitoring network included 173 and 167 monitoring wells, respectively. A total of 135 wells are located in vertical profiles with two-, three-, or four-well nests/clusters designed to monitor vertical gradients and 3D water chemistry. Nested wells are wells that are located within the same borehole. Clustered wells are individual well screens that were installed at different depths and generally located within 50 ft of each other laterally and 80 ft of each other vertically. The 42 well nests/clusters consist of nine nested wells (13 well screens/sample points) and 33 clustered wells (115 well screen/sample points). The use of multiple well screens at different depths allows for assessment of the plume in three dimensions.

2. *Is there adequate hydrogeologic information for performing capture zone evaluations?*

   Yes, quarterly analyses are used to identify data gaps and define locations for additional monitoring wells. Based on this information, the performance of the monitoring well network can be continually improved when new wells are installed to fill in the data gaps. A summary of hydrogeologic information used for the capture zone evaluations follows:

   - Groundwater levels across the site are measured during 3- to 5-day synoptic periods every quarter (note that "groundwater level" and "head" are used interchangeably). Based on screen interval elevations, the monitoring well network has been divided into three horizons/REIs that allow for a systematic way to analyze the horizontal flow and vertical gradients at depth in the aquifer.

   - Water chemistry data are collected from the entire monitoring well network in Q2 and Q4 of every year in order to define and monitor the extent and character of contaminant concentrations, including dissolved-phase EDB addressed in this section.

   - Quarterly water level measurements have shown that the groundwater levels in the project area have been increasing at an average rate of approximately 3.3 ft per year since 2013. However, groundwater levels across the project area decreased in the latter half of 2020, presumably due to additional groundwater extraction for drinking purposes both on-Base and off-Base in response to drought conditions (Table 5-2). Groundwater levels rose by an average of 1.3 ft between the Q4 2020 and Q2 2021 gauging events. In Q2 2021, well screens of 38 monitoring wells within the GWM network were unsubmerged.

3. *Is there a site conceptual model (not a numerical model)?*

   Yes, the plume exists in an unconfined aquifer characterized by coarse-grained, braided river deposits with a northeast-southwest-oriented channel axis (AECOM, 2016). Silt and clay units representing overbank, backwater, and/or floodplain deposits are interbedded with the coarser grained channel deposits.

   Due to relatively high evapotranspiration rates, recharge from the ground surface is usually negative. The primary source of recharge to the aquifer is from mountain front runoff and from seepage from the Rio Grande and its tributary streams and arroyos (AECOM, 2016).

   In a study of the hydrologic system of the Middle Rio Grande Basin (Bartolino and Cole, 2002), USGS states, "Though the aquifer is under confined conditions locally, it is considered to be an unconfined aquifer as a whole. (For groundwater flow modeling, the upper part of the aquifer system is treated as unconfined and the lower part as confined.)."

   The network currently incorporates 26 nested and co-located groundwater level monitoring locations (Figures 10-3 and 10-4 and Tables 10-4 and 10-5) within the IMOA, which measure pressure at vertically distinct horizons in the aquifer at relatively the same lateral location (for this discussion, wells are considered nested if the wells being compared are located less than 180 ft apart). While 23 of the nested and co-located locations gauge groundwater levels at three distinct vertical elevations, three locations gauge groundwater levels at only two elevations (one location in the upper portion of the aquifer and two locations in the lower portion). Well pairs are evaluated across the entire plume in conjunction with the Step 3 potentiometric surface analysis. Aquifer confinement would be indicated by differences in pressure between vertical nested wells.

   A comparison of the head difference between the shallow (REI 4857) and intermediate (REI 4838) monitoring location for each of the 24 well pairs shows that 63 percent (15 well pairs) represent unconfined conditions, having vertical pressure differences of between -0.1 ft and 0.1 ft (head difference rounded to the nearest tenth of a foot) (Table 10-4). The remaining 9 well pairs are scattered throughout the monitored groundwater network for the IMOA representing localized aquifer separation due to discontinuous interbedded fine grain lenses between the nested well screens. A comparison of the head difference between the intermediate (REI 4838) and deep (REI 4814) monitoring location for each of the 25 well pairs shows that 68 percent (17 well pairs) represents unconfined conditions, having vertical pressure differences of between -0.1 ft and 0.1 ft (Table 10-5). Similar to the upper comparison, the remaining 8 well pairs are scattered around the project area representing localized aquifer separation due to discontinuous interbedded fine grain lenses between the nested well screens.

   The section of aquifer upon which the hydraulic containment analyses presented in this section are performed includes the upper part of the Santa Fe Group (Middle Rio Grande Basin), above the uppermost confining unit referred to as A2 (AECOM, 2015).

4. *Is the objective of the remedy clearly stated?*

   Yes, the objective of the groundwater pump-and-treat system is hydraulic containment (capture) and collapse of the dissolved-phase EDB is greater than 0.05 µg/L north of Ridgecrest Drive SE (TCZ).

10.4.2.2 Step 2: Define Site-Specific Target Capture Zone

According to EPA (2008), the *TCZ is defined herein as the 3D zone of groundwater that must be captured by the remedy extraction wells for the hydraulic containment portion of the remedy to be considered successful. This will depend on the site-specific remedy objectives (Step 1).*

- Water chemistry analyses for samples collected from vertically nested wells have shown that EDB in concentrations above the detection limit do not extend throughout the entire thickness of the aquifer; therefore, a 3D delineation of the TCZ is required.

- Samples for determining EDB concentrations are collected and analyzed from the full GWM network during Q2 and Q4 of each year. Therefore, dissolved-phase EDB delineations and plume comparisons are updated in the respective reports. All delineation updates are performed using the same methodology with the only variations being the insertion of the current EDB concentration data, addition of any new monitoring wells since the last assessment, and allowance of volume increase due by resetting the plume upper surface to the current water table surface.

EPA (2008) also states that *the TCZ should be defined in terms of specific criteria, such as a specific concentration contour or a geographical boundary along which an inward hydraulic gradient is to be established.*

- The 3D zone of groundwater (the iso-shell) that must be captured by the interim measure extraction wells (i.e., the TCZ) is defined as the MCL for dissolved EDB, 0.05 µg/L.

The plume delineation produced in Step 2 estimates the volume and mass of the TCZ against which the interim measure capture potential for each evaluation period is gauged. As shown in Section 10.4.1, the volume and mass of the TCZ has continued to decrease over time, meaning that the interim measure capture target has decreased. It is important to note that the decreasing plume extent affects how the effectiveness of interim measure capture is reported. For example, if the interim measure is found to capture all but 1 gram of EDB mass in the TCZ in Q4 2016, this would result in an estimated capture potential of 99 percent, while if the interim measure is found to capture all but 1 gram of EDB mass in the current TCZ, the estimated capture potential would be only 58 percent. While the two capture percentages are very different, they both represent the same amount of uncaptured mass. For this reason, the interim measure capture potential will be reported in volume and mass values, percent of current TCZ, and percent of initial TCZ that is represented by the Q4 2016 baseline TCZ delineation. The final determination of interim measure capture for the evaluation period will be based on the percent of initial TCZ captured.

10.4.2.3 Step 3: Interpret Water Levels

EPA (2008) states that *for most sites, it is appropriate to analyze groundwater flow patterns in three dimensions (i.e., both horizontal and vertical). The potential for vertical transport of contaminants to underlying or overlying aquifers should be considered. Three-dimensionality of groundwater flow patterns in the vicinity of pumping wells should also be considered.*

Horizontal and vertical hydraulic capture analyses are based on defining the direction of groundwater flow through mapping pressure in the aquifer from discrete gauging points (monitoring wells). The purpose of the performance assessment is to delineate the zone of hydraulic containment produced by each interim measure extraction well at a single point in time (period of gauging) and compare to the TCZ (dissolved-phase EDB north of Ridgecrest Drive SE).

The percentage of the plume within the containment zone will be identified as contained; meaning that, if conditions do not change, the contained portion of the dissolved-phase EDB will eventually flow to the extraction well and be removed from the aquifer. The current capture zone analyses were conducted using groundwater head and EDB concentration data sets collected during this monitoring event (Section 5 above).

It should be noted that Steps 3a and 3b, which are discussed below, are capture analyses that do not rely on the delineation or interpretation of drawdown. Drawdown is the change of water level due to groundwater extraction. It is calculated by subtracting the water level measured under pumping conditions from the water level measured without pumping. The "cone of depression" (i.e., drawdown) caused by extraction from one or more locations does not represent the capture zone associated with that extraction.

If a regional hydraulic gradient exists (which it does across the project area), there are locations outside the capture zone where drawdown due to pumping is observed. These analyses define capture by delineating the flow field under pumping conditions only.

Step 3a: Potentiometric Surface Maps (Horizontal Capture Analysis)

EPA (2008) states that *horizontal capture is defined by a bounding flow line, within which all other flow lines reach an extraction location. The delineation of the capture zone in this manner is a derived interpretation since water level contours must first be interpreted from water level values.*

Water level maps indicate contours of water levels within the aquifer from which the extent of horizontal capture can be interpreted. Flow lines are interpreted as perpendicular lines to water level contours. The method used in this analysis uses Esri Spatial Analyst to develop potentiometric surface grids (analogous to groundwater level contours) from measured groundwater levels, then converts the potentiometric surface grid into flow direction grids (analogues to flow lines). From the flow direction grids, still using Spatial Analyst, the hydraulic divides defining capture by each interim measure extraction well are delineated.

Capture analyses are performed in Q2 and Q4 of each year when dissolved-phase EDB delineations are updated. The horizontal capture analysis for the current TCZ, previous TCZs, including the baseline TCZ, (Q4 2016) are summarized in Table 10-6.

Figure 10-5 shows the horizontal capture of the portion of the Q2 2021 TCZ within REI 4857. Within the REI 4857 TCZ, the interim measure was shown to capture 99.6 percent of the dissolved-phase EDB volume and 99.7 percent of the mass (Table 10-6). Table 10-7 shows REI 4857 TCZ capture divided among the four extraction wells that were active during the synoptic gauging period (KAFB-106228, KAFB-106233, KAFB-106234, and KAFB-106239). With respect to REI 4857, the performance of the interim measure extraction wells is detailed below:

- Extraction well KAFB-106234 was the most effective with capturing 66.8 percent of the TCZ volume and 71.5 percent of the TCZ mass.
- KAFB-106239 captured 28.6 percent of the TCZ volume and 24.6 percent of the mass.
- KAFB-106228 captured 3.4 percent of the TCZ volume and 3.0 percent of the TCZ mass.
- KAFB-106233 captured 0.8 percent of the TCZ volume and 0.7 percent of the TCZ mass (Table 10-7).

Figure 10-6 shows the horizontal capture of the TCZ within REI 4838 during Q2 2021. With respect to capture in the current TCZ, the interim measure resulted in the horizontal capture of 100.0 percent of the dissolved-phase EDB volume and mass (Table 10-6). The following describes the performance of the IM extraction wells within the REI 4838 TCZ (Table 10-7):

- Extraction well KAFB-106228 was the most effective, capturing 85.8 percent of the dissolved-phase EDB volume and 86.6 percent of the mass.

- KAFB-106234 captured 14.2 percent of the dissolved-phase EDB volume and 13.4 percent of the mass.

- Even though KAFB-106233 and KAFB-106239 were active, their capture zones did not intercept any of the REI 4838 TCZ volume.

There is no horizontal mass capture assessment for the REI 4814 TCZ because there were no EDB detections in excess of the MCL in REI 4814 (Figure 10-7). With respect to the total current TCZ (EDB plume within the IMOA), the interim measure resulted in the horizontal capture of 99.7 percent of the dissolved-phase EDB volume and mass (Table 10-6).

Combining the TCZ volume and mass capture analyses for both REIs 4857 and 4838, the interim measure resulted in the horizontal capture of 1.02E+07 cubic ft and 4.8 grams of the current TCZ volume and mass, respectively (Table 10-8). This equates to a capture of 100.0 percent of the initial TCZ volume and mass under Q2 2021 groundwater conditions.

With the addition of the 21 water table wells, six in Q4 2018, nine in Q1 2019, and six in Q2 2021, the flow directions and hydraulic containment along the saturated/unsaturated interface can start to be analyzed. Combining data from the additional wells and from the existing wells with screens not submerged or slightly submerged (top of screen less than 5.0 ft below the water table) in REI 4857, a water table surface will be interpolated.

Figure 10-8 shows the interpolated water table surface within the IMOA based on groundwater levels from unsubmerged screens for Q2 2021. Since this analysis merges with REI 4857 at locations throughout the domain, a unique plume split cannot be developed; however, hydraulic containment can be represented graphically by placing delineated water table containment basins over the REI 4857 plume outline as defined by dissolved-phase EDB. The data presented in Figure 10-8 indicate that along the water table, the flow directions for the TCZ are toward either interim measure extraction wells KAFB-106228 or KAFB-106234. While the potential cannot be ruled out, the likelihood of EDB migrating away from the interim measure extraction wells along the water table is very low.

Below is a list of parameters used for the interpretation of horizontal capture cited by EPA (EPA, 2008) to be considered and how this assessment addresses them:

- Are the number and distribution of measurement locations adequate?

    - Yes, while there is no rule regarding the “correct” amount of groundwater level data (EPA, 2008), each of the four interim extraction wells is surrounded by five to eight nested monitoring wells indicating the direction of flow radially around the extraction well and at depth. Groundwater level monitoring is also conducted within, at the perimeter, and

downgradient of the TCZ to interpret groundwater flow patterns and the associated capture zone.

- ― Contouring accuracy will increase as data points are added. Measurement locations have improved with the installation of 21 new wells between Q4 2018 and Q2 2021, as discussed above. Well locations are shown on Figure 3-2.

- Are water levels included in the vicinity of extraction wells (and have well inefficiency and losses been considered at extraction well locations)?

  - ― Yes, for extraction wells KAFB-106228 and KAFB-106233, which have nested monitoring wells located less than 55 ft away.

  - ― Yes, for extraction well KAFB-106234, with the addition of monitoring KAFB-106252-425 in Q2 2021 located 62 ft away.

  - ― No, for extraction well KAFB-106239; where the closest monitoring well is 150 ft away.

  - ― The water level measured in an extraction well is typically lower than the level in the adjacent aquifer due to well inefficiency and well losses (EPA, 2008). Therefore, groundwater levels at the extraction wells are estimated through linear interpolation using the measured head in the closest monitoring well to the extraction well and all other neighboring monitoring wells.

- Has the horizontal capture evaluation been performed individually for all pertinent horizontal units?

  - ― Yes, horizontal capture is performed in three REIs covering the extraction screen interval and is reported for each REI containing a portion of the TCZ.

- Is there bias based on contouring algorithm?

  - ― No, the potentiometric surface for each REI is interpolated using a natural neighbor algorithm that honors all measured values, places contours based on the distance between any one well and all of its neighboring wells and eliminates over- and under-run estimates related to the gradient between neighboring wells.

  - ― Uncertainty still exists as the method assumes that all ridges and valleys (divides) in the potentiometric surface are represented by the monitoring well network.

- Is representation of transient influences adequate?

  - ― No, but the data required to perform a fully transient evaluation are not available. Groundwater level measurements are only available for Q2 and Q4 of each year except at four locations within the model domain. Water supply well extraction rate data (on- and off-Base) are only available as monthly total volumes. It is recognized that extraction within and surrounding the project area is transient and, therefore, the regional gradient across the site is transient, requiring continual updating of the capture assessment currently scheduled to occur twice a year. As discussed in Section 10.4 above, this performance assessment is a snapshot of the system's performance. The transient nature of the system is addressed by

performing multiple capture assessments each year under different hydrogeologic conditions defined by assessment concurrent synoptic data collection events including groundwater gauging and water chemistry sampling. EPA guidance emphasizes that while the modeling used for this biannual performance assessment is a tool for evaluating and improving the site conceptual model, predicting capture zones, and evaluating alternative remediation scenarios, capture zone effectiveness is "ultimately determined by field monitoring."

- Has the potential for vertical transport been neglected when evaluating horizontal capture?

  — No, vertical transport potential is assessed separately from, but in conjunction with, horizontal capture (see next section). Horizontal capture is assessed by REI volume, and vertical transport is assessed between REIs.

Step 3b: Water Level Difference Maps (Vertical Capture Analysis)

EPA (2008) states that *water levels between adjacent hydrogeologic units are evaluated to indicate zones of upward versus downward flow. The analysis can be based on vertical head differences or vertical gradients (the head difference divided by the vertical distance between measurements).*

The vertical capture analysis for the interim measure TCZ for the current monitoring period is summarized in Table 10-9. Hydraulic containment is defined through the vertical capture analysis by evaluating groundwater levels between adjacent hydrologic units to determine zones of upward versus downward flow. Containment is defined by zones with upward flow that prevents dissolved contaminants from being transported by advection deeper into the aquifer. Vertical flow direction can be evaluated by subtracting the groundwater head measured in an adjacent lower hydrologic unit from the groundwater head measured in the overlying unit. A head difference of less than zero indicates that the head in the lower unit is greater than the head in the upper unit and, therefore, water will flow vertically upward.

Vertical hydraulic gradient is the head difference divided by the vertical distance between measuring points. While vertical gradients can provide more information than head differences because they account for the distance between measurements, error exists in calculating vertical gradients from groundwater levels measured from long screen intervals. Also, vertical gradient values are typically very small, reducing their ability to represent the magnitude of the vertical difference. Because of this and because site monitoring well screens are not uniform in saturated length and vertical placement, this analysis uses vertical head differences to illustrate vertical capture as described in the EPA guidance above.

The well network was resurveyed in 2017 by USGS, and all measuring point elevations were officially updated in October 2017. As such, the measuring point elevations and, therefore, groundwater elevations for most of the GWM wells changed from historical values, as discussed in more detail in Section 10.4.2.1.

The method for delineating vertical containment was changed in the Q4 2018 analysis. Previously, the vertical head difference between REIs was calculated by subtracting the potentiometric surfaces developed for each REI. However, uncertainty was introduced using this method as the data resolution was different within each REI because the number of head measurements decreased with depth.

Starting in Q4 2018, vertical head differences were calculated only at each nested well location. Those difference values were then used to interpolate the vertical head differences across the plume area using a linear interpolation method assigning head differences between data points based on the distance from

and magnitude of all neighboring data points. While the new method removed the data resolution issues going forward, the change limits the usefulness of comparison of vertical containment with past analyses.

The TCZ volume delineated for Q2 2021 was sliced along an elevation surface dividing REI 4857 and REI 4838 and along an elevation surface dividing REI 4838 and REI 4814. The upper dissolved-phase EDB volume has two opportunities to be contained vertically. Initially, this plume volume can be contained by upward flow between REI 4838 and REI 4857. Portions of the plume not contained in this interval have the potential to move downward into the lower unit. Once in the lower unit, these portions can be contained by vertical upward flow between REI 4814 and REI 4838. The lower plume volume can only be contained by vertical upward flow between REI 4814 and REI 4838. Potentiometric surfaces are not developed under non-pumping conditions and, as such, no pumping versus non-pumping difference maps are prepared.

Figure 10-3 shows the results of the vertical containment analysis for the upper unit TCZ volume (above the 4838 REI midpoint) in Q2 2021. All "green" areas are vertically captured and "tan" areas do not have vertical capture. With respect to the dissolved-phase EDB within the current interim measure TCZ, 99.7 percent of the dissolved-phase EDB volume and mass were vertically contained in this unit (Table 10-9). Figure 10-4 shows the results of the vertical containment analysis for the lower TCZ volume (below the 4838 REI midpoint) in Q2 2021. Similar to Figure 10-3, the "green" areas show vertical capture and "tan" areas do not have vertical capture. With respect to the current interim measure TCZ, 98.8 percent of the dissolved-phase EDB volume and 98.9 percent of the mass were vertically contained (Table 10-9).

In total (above and below the 4838 REI mid-point), the vertical capture evaluation estimated that the interim measure extraction system produced containment of 1.02E+07 cubic ft and 4.8 grams of the current TCZ volume and mass, respectively (Table 10-10). This equates to a capture of 100.0 percent of the initial TCZ volume and 100.0 percent of the initial TCZ mass under Q2 2021 groundwater conditions.

Vertical capture based on vertical head differences or vertical hydraulic gradients is subject to a similar set of uncertainties as described for horizontal capture. With respect to having an adequate vertical distribution of monitoring wells, 11 of the REI 4814 monitoring wells within the IMOA are screened above an elevation of 4,790 ft. Downward vertical flow at these well nests may be in response to the 3D capture zone of an extraction well and not the loss of capture.

Step 3c: Water Level Pairs (Gradient Control)

To support the previously presented horizontal and vertical containment analyses, a water level pairs analysis was performed. Water level pairs analysis defines gradient control points and demonstrates the direction of flow relative to the plume boundary, thus providing an initial assessment of interim measure effectiveness and a supporting line of evidence for assumptions made during horizontal and vertical containment analyses. Two types of water level pairs analyses were performed, as described below.

To support the horizontal containment analyses, a horizontal water level pairs analysis was performed for REI 4857 and REI 4838. Thiessen polygons, which define the area that is closest to each point relative to all other points within a spatial dataset, were developed for each of the interval group wells within the IMOA. Water levels were then compared among a well in the center of a polygon and all of the wells with neighboring polygons. The graphical representation of the Q2 2021 horizontal water levels pairs analysis is shown on Figure 10-9. The arrows on these figures show the potential directions of flow from each well based off of the head comparison. Polygon colors delineate the plume area as: captured (by one or more extraction wells), possibly captured (flow could go to an extraction well or to an unidentified

sink), or not captured (flow cannot go to an extraction well). The horizontal water level pairs analyses show that the entirety of the TCZ in REI 4857 and REI 4838 has the potential to flow toward at least one of the extraction wells that are part of the interim measure. However, there are regions of the TCZ, south of KAFB-106228 and south of KAFB-106234 (around monitoring well KAFB-106041), where the flow direction across the TCZ boundary is outward with respect to the TCZ footprint. Under Q2 2021 conditions, the well pairs analysis cannot conclusively define capture of the TCZ.

To support the vertical containment analysis, heads in vertically nested well sets were compared to verify the vertical flow direction. The locations of the centroid for each nested well pair are shown on Figures 10-3 and 10-4. The values associated with these wells represent the head difference when the lower unit's head is subtracted from the upper unit's head. A head difference of less than zero represents upward flow (wells shown as "green") and, therefore, vertical containment is achieved.

A head difference greater than zero presents downward flow (wells shown as orange) and, therefore, vertical containment is not achieved. Results from this well pair analysis are shown on the figures to identify the location and magnitude of gradient control points for the vertical containment analysis.

10.4.2.4 Step 4: Perform Calculations

Step 4 of the EPA Systematic Approach for Evaluation of Capture Zones (EPA, 2008) states that *specific calculations can be performed to add additional lines of evidence regarding the extent of capture, including the following:*

- *Simple horizontal analyses related to capture, such as estimated flow rate calculations and capture zone width calculations* (EPA, 2008).

- *Modeling (analytical or numerical) to simulate heads, in conjunction with particle tracking and/or contaminant transport modeling* (EPA, 2008).

- *Determining the appropriate types of calculations to perform should be based on site complexity. For instance, numerical simulation of heads for evaluating capture may not be necessary for sites with very simple hydrogeology and only minor heterogeneity of aquifer parameters* (EPA, 2008).

The 16 November 2017 Notice of Deficiency (NOD) required the Air Force to perform the six-step plume capture analysis in accordance with EPA guidance. This NOD, which was issued ahead of the completion of NMED's formal review of the January 20, 2017, "Resource Conservation and Recovery Act Facility Investigation Report" (RFI Phase I), contained direction related to the potential impacts of the rising water table on the Air Force's "…*ability to complete a robust calculation of EDB* [ethylene dibromide] *plume mass and removal.*" Specifically, the NOD required the development of a numerical or analytical model to address the impacts of "…*reduced resolution of monitoring data at the water table*…" from the rising water table.

The Air Force began semiannual plume capture modeling to support capture zone analysis and evaluate the performance of the interim measure in Q2 2018. The modeling results were presented in the Q2 and Q4 periodic monitoring reports for the BFF, SWMUs ST-106/SS-111. In Q4 2016, fifteen months after the first interim measure extraction well became active, the TCZ volume and mass were estimated at approximately 115.7 million cubic feet and 104 grams, respectively (Table 10-3). By the end of Q2 2021, the interim measure had extracted and treated approximately 1.161 billion gallons of groundwater (Table 7-2), decreased the TCZ volume by 91.1 percent, and reduced the TCZ mass by 95.3 percent. Monitoring data collected in the IMOA demonstrates that the pump-and-treat system has successfully

collapsed the targeted portion of the EDB plume and is currently containing the isolated EDB detections north of Ridgecrest Drive SE.

In the Q4 2020 assessment period (Kirtland AFB, 2021c), EDB was not detected in any of the deep monitoring wells sitewide. Of the 82 GWM wells within the IMOA north of Ridgecrest Drive SE, samples from 76 had concentrations of EDB either below the MCL or were non-detect. All locations where detections were above the MCL have downgradient monitoring sampling points with non-detect concentrations.

Over the past several years of model development, pumping rates and hydraulic parameters have been established and are now well understood, and no further estimation of aquifer parameters is anticipated in the near future. The interim measure capture evaluations over the six quarters from Q2 2018 through Q4 2020 were based on numerical modeling consistently showing hydraulic containment of ≥ 97 percent of the Initial Q4 2016 TCZ volume and mass (Table 10-11), which is in agreement with Step 3 capture evaluation results. Consistent with the iterative approach outlined in the EPA guidance, the Air Force has determined that capture is sufficient, modeling no longer adds value to the evaluation of the interim measure, and that ongoing routine monitoring is sufficient to evaluate future progress of the interim measure. Therefore, beginning in Q2 2021, Step 4 of the six-step process will not be performed, and capture evaluation will be accomplished by performing the groundwater level based horizontal and vertical analyses described in Step 3.

10.4.2.5 Step 5: Evaluate Concentration Trends

Step 5 of the EPA Systematic Approach for Evaluation of Capture Zones (EPA, 2008) states that *Contaminant concentrations can be monitored at two types of locations downgradient of the TCZ in an attempt to interpret capture…:*

- *Sentinel wells located downgradient of the TCZ and are not currently impacted above background concentrations.*

- *Downgradient performance monitoring wells located downgradient of the TCZ and are currently impacted above background concentrations.*

Trends of concentrations measured downgradient of the dissolved-phase EDB plume provide supporting evidence to the primary capture analyses. Concentration trends are being performed at two location types at Kirtland AFB: performance assessment sentinel wells and downgradient performance monitoring wells. For sentinel wells, contaminant concentrations should remain at background levels over time if capture is successful. For downgradient performance monitoring wells, contaminant concentrations should decline to background levels (or below cleanup levels) over time if capture is successful. Figure 10-10 shows the location of the nine monitored performance assessment sentinel wells and the location and concentration trends in the five distal performance monitoring wells. EDB concentrations in the performance assessment sentinel wells have remained below laboratory detection limits since monitoring began.

Concentration trends in distal performance monitoring wells are shown (Figure 10-10) from the beginning of 2015 to the present. Within this time period, water chemistry samples from KAFB-106205, located northeast of the distal end of the dissolved-phase EDB plume, have mostly been non-detect for EDB and have always been below the TCZ concentration of 0.05 µg/L. The increase of EDB in Q2 2017 was a result of a 30-day system shutdown. With the interim measure extraction returning to full capacity, the concentration in KAFB-106205 decreased and continued to be below the detection limit.

Groundwater samples collected from KAFB-106106, located on the western edge of the dissolved-phase EDB boundary, have historically had detectable EDB concentrations. Before interim measure extraction began in June 2015, EDB concentrations in this well were above the EDB MCL concentration (0.05 µg/L) and the well was within the dissolved-phase EDB boundary. Since interim measure wells KAFB-106233 and KAFB-106234 came on-line in 2016, the EDB concentrations in KAFB-106106 have declined so that for the last eight assessment periods, they have been at or below the laboratory detection limit. EDB was reported below the detection limit of 0.019 µg/L in the groundwater sample collected from KAFB-106106 in Q2 2021.

At the beginning of 2015, EDB was detected in groundwater samples collected from the three clustered wells (KAFB-106055, KAFB-106057, and KAFB-106058). Concentrations above the MCL were observed in well KAFB-106055 (REI 4857) and well KAFB-106057 (REI 4838) and decreased with depth. Since interim measure extraction began regular operation at KAFB-106234 in January 2016, the EDB concentrations in KAFB-106057 and KAFB-106058 have decreased and currently have estimated values at or below the laboratory detection limit. In Q4 2018, the data gap associated with submergence at this well nest was eliminated by the installation of monitoring well KAFB-106241-428 that is screened across the water table. The EDB concentration measured in this well has been constantly below 0.05 µg/L since sampling began in Q4 2018, with an estimated Q2 2021 concentration of 0.017 µg/L (below the detection limit).

10.4.2.6 Step 6: Interpret Actual Capture and Compare to Target Capture Zone

Step 6 of the EPA Systematic Approach for Evaluation of Capture Zones (EPA, 2008) states that, *Once multiple lines of evidence regarding capture have been evaluated, actual capture achieved by the extraction wells should be interpreted… To avoid bias, the actual capture should be interpreted independent of the TCZ (i.e., they should be compared after the actual capture zone is interpreted).*

Based on evaluations discussed in Step 3 and Step 5 described above, the actual capture achieved by the interim measure extraction wells is interpreted in Step 6, and the following items are addressed:

- Compare the interpreted capture zone to the TCZ
- Assess uncertainties in the interpretation of the actual capture zone
- Assess the need for additional characterization and/or monitoring

In Step 3, the potentiometric surface analysis resulted in 100 percent capture of the volume and mass of the initial TCZ. The vertical head difference analysis resulted in an estimated containment of 100 percent of the initial TCZ. In Step 5, the concentration trends in the designated performance monitoring wells show static or decreasing trends indicating decreasing dissolved-phase EDB volume and mass reduction. Table 10-11 summarizes the TCZ evaluation for this site, which concludes that 100 percent of the initial TCZ volume and mass for which the interim measure was designed to contain are being captured under Q2 2021 conditions.

10.4.2.6.1 Uncertainty and Data Gaps

With the removal of Step 4 from the capture evaluation process, uncertainty estimation is limited to the Step 3 and Step 5 analyses. The primary source of uncertainty in the Step 3 analyses is related to the density of the gauging network. The accuracy of estimation of the location of hydraulic divides created by the interim measure extraction wells is limited by the distance between operational area monitoring wells. The process assumes that the gauging network represents all of the high and low groundwater elevations in the operational area. While the low groundwater elevations should be accounted for with monitoring

wells located close to interim measure extractions wells, the uncertainty of the location of hydraulic highs (capture divides) is a function of the distance between monitoring wells. For example, the distance between monitoring wells in the operational area for REI 4857 ranges from 53 to 2,087 ft with a mean distance of 752 ft. This means that on average, the location of a capture divide could vary within the mean distance if the monitoring network does not represent the operational area high groundwater elevations.

Capture zone analysis is an iterative process, as shown on Figure 10-11, and includes the following:

- Evaluate capture based on existing data
- Identify any data gaps that create uncertainty in the conclusions of the capture zone analysis
- Fill any data gaps that are identified (e.g., add new monitoring wells), and re-evaluate capture
- Continue monitoring capture over time
- If capture is ever determined to not be sufficient, optimize the extraction system until capture is sufficient
- If capture is determined to be sufficient, continue routine monitoring and consider the potential to optimize extraction locations and/or rates to reduce cost

The installation of the six most recent data gap monitoring wells began in Q4 2020 under the Work Plan for Data Gap Monitoring Well Installation KAFB-106248 to KAFB-106252 (Kirtland AFB, 2019). In Q2 2021, these six monitoring wells were active in the gauging and sampling network. In addition, analysis methods are continuously evaluated through comparison to observed data and are revised when more accurate results can be obtained.

As discussed in Section 10.4 above, this performance assessment is a snapshot of the system's performance. EPA guidance emphasizes that capture zone effectiveness is "ultimately determined by field monitoring," and modeling is only one line of evidence used to support the field monitoring data.

10.5 Analysis of the Lines of Evidence

The following includes the various lines of evidence used in the plume capture assessment:

- The volume and mass of the plume has reduced significantly over time. In Q4 2016, 15 months after the first interim measure extraction well KAFB-106228 became active, the plume volume and mass were estimated at 1.15E+08 cubic ft and 103.9 grams, respectively (Table 10-3). Both of these values have been on a decreasing trend over the last 5 years with the current plume volume and mass estimated at approximately 1.02E+07 cubic ft and 4.8 grams, respectively (Table 10-3). With respect to the Q4 2016 TCZ, the Q2 2021 TCZ represents a 91.1 percent decrease in plume volume and a 95.3 percent decrease in plume mass.
- This analysis shows that the interim measure has collapsed the TCZ, with the bulk of the remaining volume and mass north of Ridgecrest Drive SE either being located in isolated segments south of extraction well KAFB-1062234 or as an extension from the source area to the KAFB-106228 cone of depression. Overall, the plume analysis reveals the general pattern of dissolved-phase EDB volume and mass response expected due to interim measure system extraction.

- Actual field sampling resulted in potentiometric surface analyses estimating that the interim measure extraction system produced horizontal containment of approximately 1.02E+07 cubic ft and 4.8 grams of the current TCZ volume and mass, respectively (Table 10-6). This equates to a horizontal capture component of 100.0 percent of the initial TCZ volume and 100.0 percent of the initial TCZ mass under Q2 2021 groundwater conditions (Table 10-8).

- The vertical capture analysis estimated that the interim measure extraction system produced containment of approximately 1.02E+07 cubic ft and 4.8 grams of the current TCZ volume and mass, respectively (Table 10-9). This equates to a vertical capture component of 100.0 percent of the initial TCZ volume and 100.0 percent of the initial TCZ mass under Q2 2021 groundwater conditions (Table 10-10).

- The horizontal water level pairs analyses within the IMOA show that all well pair gradients within or surrounding the plume boundary north of Ridgecrest Drive SE in REI 4857 and REI 4838 have the potential to flow toward one or more interim measure extraction wells.

- Concentration trends analysis in performance monitoring wells indicated static or decreasing trends of dissolved-phase EDB volume and mass reduction.

- Table 10-12 summarizes the TCZ evaluation for this site, which concludes that 100.0 percent of the initial TCZ volume and mass the interim measure was designed to contain is being captured under Q2 2021 conditions.

- Capture zone effectiveness is ultimately determined by field monitoring that includes hydraulic head measurement and groundwater sampling and analysis, in conjunction with field confirmation of pumping rates.

- A total of 14 USGS sentinel wells installed outside the IMOA between the EDB plume and drinking water wells owned and operated by the Albuquerque Bernalillo County Water Utility Authority and Raymond G. Murphy VA Medical Center were tested, and no contaminants associated with the BFF release were detected in Q2 2021 samples. These wells are tested quarterly to provide advance notice of any threat to drinking water wells. The USGS transmittal letter, including the Q2 2021 data results, is provided in Appendix H-5.

- Three Kirtland AFB drinking water supply wells (KAFB-003, KAFB-015, and KAFB-016) and the VA drinking water supply well (ST106-VA-2) are sampled monthly to verify the safety of the drinking water. No dissolved-phase organic contamination was detected in the sample collected in Q2 2021 from the drinking water supply wells.

These lines of evidence suggest that under Q2 2021 conditions, 100 percent of the initial TCZ volume and mass for which the interim measure was designed to contain is being captured.

10.6 Data Gaps

No data gaps were identified in Q2 2021. The current IMOA monitoring network is assumed to be sufficient to represent the extent of the TCZ and to evaluate TCZ capture produced by the IM extraction network. The network now includes six new nested water table wells addressing a previous data gap stemming from submerged well screens due to water table rise. Monitoring network data gaps will be evaluated in the future as the TCZ continues to change due to IM activities.

10.7 Recommendations

It is recommended that monitoring and GWTS operation continue in accordance with the schedules provided in the approved work plans (Section 1.1).

Q3 2021 will comprise the period between July 1 and September 30, 2021. Planned Q3 2021 activities are summarized below:

Groundwater Monitoring

- Perform and report on quarterly GWM in Q3 2021
- Report quarterly monitoring of USGS sentinel wells (by USGS)

Drinking Water Supply Well Monitoring

- Perform drinking water supply well monitoring monthly for organic compound analysis for the four wells sampled, and once for semi-annual inorganic compound analysis

Groundwater Treatment System Operation

- Continue operating the GWTS and extraction wells KAFB-106228, KAFB-106233, KAFB-106234, and KAFB-106239

- Perform GWTS well disinfection as required

Reporting

- Prepare a report to detail the activities conducted during quarterly monitoring

Notes:
Aerial Imagery from 10/04/2020 : Google Earth Pro, 2020
Title depth is the nominal depth for the monitoring interval.
VISL exceedances are shown in bold.
Concentrations for EDB and benzene are reported in $\mu g/m^3$.
Concentrations for HC are reported in ppmv.
$\mu g/m^3$= microgram(s) per cubic meter
bgs = below ground surface
EDB = 1,2-dibromoethane (ethylene dibromide)
ft = foot/feet
HC = hydrocarbon
ND = nondetect
ppmv = parts per million by volume
Q2 = quarter 2
VISL = vapor intrusion screening level
Qualifier:
J = qualifier denotes the analyte was positively identified, but the associated numerical value is estimated

Title depth is the nominal depth for the monitoring interval.
Concentrations for EDB and benzene are reported in µg/m^3.
Concentrations for HC are reported in ppmv.
µg/m^3= microgram(s) per cubic meter
bgs = below ground surface
EDB = 1,2-dibromoethane (ethylene dibromide)
ft = foot/feet
HC = hydrocarbon
ND = nondetect
ppmv = parts per million by volume
Q2 = quarter 2
Qualifier:
J = qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.

TABLES

Table 2-1
DP-1839 Discharge Permit Terms and Conditions, Operations and Maintenance Plan Cross References

Condition No.	Terms and Conditions	Reference Location in Periodic Monitoring Report
15[a]	The Permittee shall ensure the treated effluent conveyance system, i.e., piping, between the GWTS and the UIC well(s) does not leak and shall report any such leakage to the NMED GWQB in accordance with 20.6.2.1203(A) NMAC and copy the NMED HWB.	Not applicable in Q2 2021
	Within 1 year of the effective date of this Discharge Permit, the Permittee shall demonstrate the structural integrity of the treated effluent conveyance system between the GWTS and KAFB-7.	Not applicable in Q2 2021
	Prior to testing, the Permittee shall propose for NMED approval the test method to be used.	Not applicable in Q2 2021
	The results of the mechanical integrity testing shall be submitted to NMED within 60 days of test completion.	Not applicable in Q2 2021
	The Permittee shall integrity test the treated effluent conveyance system between GWTS and the UIC well(s) prior to submitting a permit renewal application. [20.6.2.3106(C) NMAC, 20.6.2.3107(A) NMAC]	Not applicable in Q2 2021
17	The Permittee shall conduct the monitoring, operations, and reporting listed below.	Section 7.1 Groundwater Treatment System Operation
	Unless otherwise specified, all periodic monitoring results or general information obtained shall be reported in the forthcoming quarterly report. [20.6.2.3107 NMAC]	Section 7.1 Groundwater Treatment System Operation
18	Unless otherwise approved by NMED, the Permittee shall conduct sampling in accordance with standard industry practice.	Section 7.2 Groundwater Treatment System Performance Monitoring
	Sampling in accordance with the most current version of the GWTS Sampling and Analysis Plan (Appendix L of the O&M Plan), which includes sampling locations, procedures, field measurements, quality control samples, handling and custody, analytical methods, quality control, analytical validation, and reporting requirements, satisfies this Condition. [20.6.2.3107(B) NMAC]	Section 7.2 Groundwater Treatment System Performance Monitoring and 1,2-Dibromoethane Removal
19	The Permittee shall submit quarterly and annual reports to NMED pursuant to the most recent NMED HWB approved Work Plans.	Section 7.2 Groundwater Treatment System Performance Monitoring and 1,2-Dibromoethane Removal
	The Permittee shall identify the portions of these reports pertaining to this Discharge Permit with a table in the reports that identifies those portions.	Table 2-1 DP-1839 Discharge Permit Terms and Conditions, Operations and Maintenance Plan Cross References
	Quarterly reports shall be submitted as specified below unless otherwise authorized by NMED: • January 1st through March 31st - due by June 30th • April 1st through June 30th - due by September 30th • July 1st through September 30th - due by December 31st • October 1st through December 31st - due by March 31st	Noted
	Annual reporting requirements for the previous year, i.e., January 1 through December 31, shall be reported in the March 31 quarterly report. [20.6.2.3107(A) NMAC]	Noted
20	The Permittee shall monitor the concentration of all COCs listed on Table 2 in GWTS treated effluent. Associated sampling and analysis shall be performed monthly at a minimum.	Section 7.2 Groundwater Treatment System Performance Monitoring and 1,2-Dibromoethane Removal Table 7-5 Monthly GWTS Performance Analytical Results for Train 1, Q2 2021 Table 7-6 Monthly GWTS Performance Analytical Results for Train 2, Q2 2021
	When groundwater from a new extraction well is first introduced to the GWTS, COC monitoring of the GWTS treated effluent shall occur daily for the first week of treatment, weekly for the first month of treatment, and monthly thereafter.	Not applicable in Q2 2021
	If alterations to, or conditions at, the GWTS result in a potential impact to effluent quality, the Permittee will repeat this sampling sequence as directed by NMED.	No effluent quality impacts Q2 2021
20	A representative sample of GWTS influent and effluent shall be analyzed annually for the constituents identified in Table 3.	Performed in Q3 2020; last reported in Q3 2020; Not applicable to Q2 2021.
	A representative sample of GWTS influent and effluent shall be analyzed every 5 years for the constituents identified in Table 4	Performed in Q3 2017; last reported in Q3 2017; Not applicable to Q2 2021
	The first analysis of the 7-year constituent list shall occur in July 2017. Any newly identified constituents detected during the 7-year sampling events will be added to the annual sampling constituent list in Table 3.	Performed in Q3 2017; last reported in Q3 2017; Not applicable to Q2 2021
	All analysis of GWTS influent and effluent shall utilize analytical methods with detection limits that are sufficiently low to allow comparison to the standards included in the above referenced state and federal regulations.	Section 3.5.4 Interim Measure Table 7-5 Monthly GWTS Performance Analytical Results for Train 1, Q2 2021 Table 7-6 Monthly GWTS Performance Analytical Results for Train 2, Q2 2021
	All sampling, analysis, and reporting shall comply with the most recent approved Work Plans. [20.6.2.3107(A) NMAC and 20.6.2.3107(B) NMAC]	Section 3.4 Interim Measure

Table 2-1
DP-1839 Discharge Permit Terms and Conditions, Operations and Maintenance Plan Cross References

Condition No.	Terms and Conditions	Reference Location in Periodic Monitoring Report
21	The Permittee shall report the volume of treated GWTS effluent discharged to each UIC well each quarter. This report shall include the following:	See Below
	a. Monthly average, maximum, and minimum values for flow rate and volume of treated effluent transferred to each UIC well	Table 7-3 Groundwater Treatment System Injection Well Performance, Q2 2021
	b. The totalized monthly volume of treated effluent transferred to all UIC wells	Table 7-2 Quantities of Groundwater Treated and Discharged, Q2 2021
	c. Monthly average, maximum, and minimum head values of injection water for each UIC well.	Table 7-3 Groundwater Treatment System Injection Well Performance, Q2 2021
	The Permittee shall monitor the GWTS effluent volume utilizing an effluent flow meter installed on the effluent pump skid after the GAC units. Each UIC well shall have a dedicated flowmeter. Flowmeters shall be inspected and calibrated in accordance with the associated manufacturer's recommendations. [20.6.2.3107 NMAC]	Table 7-3 Groundwater Treatment System Injection Well Performance, Q2 2021 Table 7-8 GWTS Routine Maintenance (Monthly Flowmeter Inspection and Annual Calibration Verification)
22	The Permittee shall include the following results and general information in quarterly reports to NMED:	See Below
	a. Any mechanical integrity (tests) conducted on either the GWTS or a UIC well	Section 7.4.3 Non-Routine Maintenance Table 7-9 GWTS Non-Routine Maintenance Items, Q2 2021
	b. Any replacement of GAC media and the associated data that initiated the decision to replace the media	Section 7.4.3 Non-Routine Maintenance Table 7-9 GWTS Non-Routine Maintenance Items, Q2 2021
	c. Any UIC well rehabilitation conducted	Section 7.4.3 Non-Routine Maintenance Table 7-9 GWTS Non-Routine Maintenance Items, Q2 2021
	d. Any malfunction, repair, or replacement of a flowmeter	Section 7.4.3 Non-Routine Maintenance Table 7-9 GWTS Non-Routine Maintenance Items, Q2 2021
	e. Any additional operational changes with the potential to affect the discharge. [20.6.2.3107 NMAC]	Section 7.4.3 Non-Routine Maintenance Table 7-9 GWTS Non-Routine Maintenance Items, Q2 2021
23	The Permittee shall monitor the groundwater wells in the vicinity of KAFB-7 and in the vicinity of any newly installed UIC well(s) to determine any change to aquifer chemistry that may be the result of injection.	Not applicable in Q2 2021
	This monitoring shall be performed annually, shall conform to the procedures of the most current approved Work Plan, and shall measure the COCs listed in Table 2. This chemistry will be reported in the Annual Report for BFF.	Provided in the Q4 2020 Report; Section 6.2.1.1
	ST-105 Annual Report includes elevation contour mapping and analytical parameters identified in the Stage 2 Abatement Plan.	Reported annually in the ST-105 Annual Report
	The Permittee shall develop a groundwater elevation contour map depicting the groundwater flow direction in the vicinity of each UIC well and report it in the ST-105 Annual Report.	Reported annually in the ST-105 Annual Report Also reported in Q4 of each year, last reported in Q4 2020
	If the chemical quality of the treated groundwater being injected changes over time, NMED may require the Permittee to repeat geochemical modeling (numeric or analytical) to predict the interaction between the treated effluent and receiving groundwater. [20.6.2.3107 NMAC]	Not applicable in Q2 2021
24	The Permittee shall post all reports required by this Discharge Permit on Kirtland AFB's most current website (e.g., https://kirtlandafb.tlisolutions.com/main.aspx.) [20.6.2.3107(A) NMAC]	http://afcec.publicadmin-record.us.af.mil/search.aspx
34	In the event the Permittee proposes a change to the facility or the facility's discharge that would result in a change in the volume discharged; the location of the discharge; or in the amount or character of water contaminants received, treated, or discharged by the facility that differs from the terms and conditions in this Discharge Permit, the Permittee shall notify NMED prior to implementing such changes.	Noted
	The Permittee shall obtain approval (which may require modification of this Discharge Permit) by NMED prior to implementing such changes. [20.6.2.7(P) NMAC, 20.6.2.3107(C) NMAC, 20.6.2.3109(E) and (G) NMAC]	Noted

Table 2-1
DP-1839 Discharge Permit Terms and Conditions, Operations and Maintenance Plan Cross References

Condition No.	Terms and Conditions	Reference Location in Periodic Monitoring Report
35	In the event the Permittee proposes to construct or change an existing system such that the quantity or quality of the discharge will change substantially from that authorized by this Discharge Permit, the Permittee shall submit construction plans and specifications to NMED for the proposed system or process unit prior to the commencement of construction.	Noted
	In the event the Permittee implements changes to an existing system authorized by this Discharge Permit which will result in only a minor effect on the quality of the discharge, the Permittee shall report such changes (including the submission of record drawings, where applicable) in the next quarterly report to NMED. [20.6.2.1202(A) and (C) NMAC, New Mexico Statutes Annotated 1978, §§ 61-23-1 through 61-23-32]	Not applicable in Q2 2021

[a] Conditions 1 through 14 do not apply to quarterly reporting.
AFB = Air Force Base
BFF = Bulk Fuels Facility
COC = contaminant of concern
GAC = granular activated carbon
GWTS = groundwater treatment system
GWQB = Groundwater Quality Bureau
HWB = Hazardous Waste Bureau
NMAC = New Mexico Administrative Code
NMED = New Mexico Environment Department
No. = number
O&M = operation and maintenance
Q1 = first quarter
Q2 = second quarter

[a] Filter Pack Volume (V) was calculated using the following equation: $((\pi * d^2) / 4) * P * L = V$
$\pi \approx 3.14159$
d = Diameter of the borehole casing (0.833 ft)
P = Porosity of sand (assumed 0.3)
L = Length of the screened interval (ft)

AOI = area of interest
bgs = below ground surface
ft = foot
ft^2 = square feet
ft^3 = cubic feet
ID = identification
in = inch

Table 3-2
Groundwater Monitoring Program

[a] Monitoring Well Objective:

Downgradient Proximal (Seasonal) Wells—Primarily located north of Ridgecrest Drive SE surrounding the historical EDB plume to the north and east into the distal portion of the GWM network. One well located to the south and east of the Benzene plume. Groundwater flow direction varies seasonally; these wells are downgradient of the EDB plume during part of each year. Analytical data for these wells have been historically below the MCL for EDB. Sampled every quarter. These wells assist in plume boundary definition.

Former Downgradient Proximal; Current Upgradient Wells—Primarily located north of Ridgecrest Drive SE to the west and north of the historical EDB plume. These wells were previously downgradient of the historical EDB plume, but as groundwater flow direction has shifted, they are currently upgradient. Sampled every quarter.

Groundwater Monitoring Wells—Primarily located north of Ridgecrest Drive SE within the historical footprint of the EDB plume. Analytical data from these wells help to estimate the volume and mass of the EDB plume throughout the GWM network. Sampled in Q2 and Q4 at a minimum, with wells previously designated as newly added sampled every quarter.

KAFB-003 Sentinel Wells—One set of nested wells located west of drinking water production well KAFB-003. Sampled every quarter. These wells help to assess any potential contaminant migration towards KAFB-003.

KAFB-015 Sentinel Wells—One set of nested wells located east of drinking water production well KAFB-015. Sampled every quarter. These wells help to assess any potential contaminant migration towards KAFB-015.

KAFB-016 Sentinel Well—One well located west of drinking water production well KAFB-016. Sampled every quarter. This well helps to assess the potential for contaminant migration towards KAFB-016.

Paired wells—Wells located near a GWM IM extraction well to assess the quality of the water entering the extraction well.

Signal Wells—Three wells located along the south side of Ridgecrest Drive SE to monitor BTEX and provide early indication if the benzene plume is migrating from the source area into the interim measure target area capture zone created by the groundwater

Source Area Wells—Primarily located in the Bulk Fuels Facility south of Randolph Road SE and proximal to the spill site on-Base. Sampled during Q2 and Q4 at a minimum, with some sampled every quarter. These wells monitor the higher concentrations of dissolved-phase plumes on-Base.

Veterans Affairs (VA) Proximal Wells—Three sets of nested wells located between the historical EDB plume south of Ridgecrest Drive SE and the Raymond G. Murphy VA Medical Center as a means to observe for potential contaminant migration towards the VA medical campus. Sampled every quarter. These wells provide additional wellhead protection monitoring for the VA supply well.

[b] The groundwater monitoring network consists of 174 wells, 167 wells that are currently sampled (see note "f", below), and one well which will be sampled once water level has risen sufficiently (note "e"). Select wells are identified for additional or more frequent

Newly Added Wells—Newly added wells can include both existing wells that are added to the GWM network as well as newly installed wells. Newly added GWM wells require a minimum of eight quarters of baseline sampling for the full-suite of analytes. These wells have been added to assess the plume boundaries and provide additional water table monitoring due to the rising groundwater elevation.

Groundwater Monitoring Wells—Wells which have completed the minimum, baseline full-suite analytical sampling. These wells can serve any of the objectives described above.

[c] Well sampled with passive sampling methodology; field parameter measurements are not representative and therefore are not collected.

[d] Well was removed from the groundwater monitoring network due to safety concerns after Q2 2016. These concerns were mitigated and sampling resumed in Q4 2019; sampling at this well is considered supplemental to the groundwater monitoring program.

[e] Wells initially installed for vadose zone characterization. These wells were added to the GWM network to temporarily fill a data gap as the water level rose across the site.

[f] KAFB-106211 will be included for sampling when it has enough saturated water column to deploy passive samplers (former air sparge well).

[g] KAFB-106229 is not formally part of the groundwater monitoring network. However, it gets sampled semiannually for EDB.

[h] Baseline analyses conducted for a total of eight quarters.

BTEX = benzene, toluene, ethylbenzene, and total xylenes
DRO = diesel range organics
EDB = 1,2-dibromoethane (ethylene dibromide)
FP = field parameter
GRO = gasoline range organics
GWM = groundwater monitoring
ID = identification
IM = interim measure
MCL = maximum contaminant level
Q2 = second quarter
Q4 = fourth quarter
SE = Southeast
VA = Veterans Affairs
VOC = volatile organic compound

Table 3-3
Groundwater Monitoring Wells Sampled, Q2 2021

[a] Well installation date is the date provided in ERPIMS, except where the date in ERPIMS is the start of drilling, in which case the well installation date is the date provided in the well completion diagram submitted to the NMOSE.

[b] Screen interval is rounded to the nearest foot.

[c] Well screens in REI 4857 wells intersected the water table when they were installed and current screen submergence is the result of the rise of the water table. Well screens in REI 4838 and 4814 wells were designed with the screened interval fully submerged to capture conditions at depths below the water table.

[d] Portable equipment sampling depths are estimated to the nearest foot as 2 ft below top of screen if submerged or 2 ft above bottom of screen if not submerged.

[e] Dedicated pump sampling depth is estimated as half-way between top and bottom of screen.

[f] Passive sampling depth is estimated to the nearest foot as the depth to the top of the highest sampler.

[g] The analytical methods for EDB and VOCs (including BTEX) are 8011 and 8260C, respectively. Metals analyses consisted of select total metals (arsenic, calcium, lead, potassium, magnesium, and sodium by analytical Method 6020A/6010C and select and dissolved metals (iron and manganese) (6010C). Anions analysis consisted of bromide by Method 300.0A, chloride by Method 300.0A, nitrate/nitrite nitrogen by Method 353.2, and sulfate by Method 300.0A. Field parameters include pH, specific conductivity, dissolved oxygen, oxidation reduction potential, temperature, and turbidity.

[h] Wells initially installed for vadose zone characterization. These wells were added to the GWM network to temporarily fill a data gap as the water level rose across the site.

[i] New wells will be sampled for eight quarters for baseline analyses.
-- = well was designed with the screened interval fully submerged to capture conditions at depths below the water table
AMSL = above mean sea level
DRO = disel range organics
GRO = gasoline range organics
bgs = below ground surface
BTEX = benzene, toluene, ethylbenzene, and total xylene
EDB = 1,2-dibromoethane (ethylene dibromide)
ERPIMS = Environmental Resources Program Information Management System
FP = field parameters
ft = foot/feet
GWM = groundwater monitoring
ID = identification
NMOSE = New Mexico Office of the State Engineer
REI = reference elevation interval
VOC = volatile organic compound

[a] Purge rate was not recorded; volume purged is estimated.
-- = Parameter or analyte not required for analysis in Q2
AOI = area of interest
CO_2 = carbon dioxide
ft^3 = cubic foot
HC = hydrocarbon
ID = identification
inW = inches of water
O_2 = oxygen
ppmv = part per million by volume
Q2 = second quarter
SVEW = soil vapor extraction well
SVMW = soil vapor monitoring well

Table 4-2
Analytical Data from Off-Base Soil Vapor Monitoring Points, Q2 2021

[a] Samples are collected from the screened intervals presented on Table 3-1.

µg/m^3 = microgram per cubic meter
EPA = U.S. Environmental Protection Agency
ID = identification
LOD = limit of detection
ND = not detected
Q2 = second quarter
REG = normal field sample
Val Qual = validation qualifier
VOC = volatile organic compound
Shading = detected concentrations
Val Quals based on independent data validation:
-- = Validation qualifier not assigned.
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.
U = Qualifier denotes the analyte was analyzed but not detected.

Table 4-3
Analytical Data from On-Base (Outside the Source Area) Soil Vapor Monitoring Points, Q2 2021

[a] Samples were collected from the screened intervals presented on Table 3-1.

µg/m^3 = microgram per cubic meter
EPA = U.S. Environmental Protection Agency
ID = identification
LOD = limit of detection
ND = not detected
Q2 = second quarter
REG = normal field sample
Val Qual = validation qualifier
VOC = volatile organic compound
Shading = detected concentrations
Val Quals based on independent data validation:
-- = Validation qualifier not assigned.
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.
U = Qualifier denotes the analyte was analyzed but not detected.

Table 4-4
Analytical Data from On-Base (Inside the Source Area) Soil Vapor Monitoring Points, Q2 2021

[a] Samples were collected from the screened intervals presented on Table 3-1.

µg/m^3 = microgram per cubic meter
EPA = U.S. Environmental Protection Agency
ID = identification
LOD = limit of detection
ND = not detected
Q2 = second quarter
REG = normal field sample
Val Qual = validation qualifier
VOC = volatile organic compound
Shading = detected concentrations
Val Quals based on independent data validation:
-- = Validation qualifier not assigned.
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.
U = Qualifier denotes the analyte was analyzed but not detected.

Table 5-1
Groundwater Elevations and LNAPL Thicknesses, Q2 2021

[a] Well depths were measured in Q4 2020 in wells without a dedicated pump. For wells with a dedicated pump, the total depth is based on the information provided in the well completion diagram.

[b] See Appendix E-2 for corrections to water level and LNAPL depths based on interface probe calibration.

[c] Screen submergence depth is calculated for wells which intersected the water table when they were installed; those are the wells located in REI 4857 and 4857/4838. It is calculated as the difference between the groundwater elevation corrected for LNAPL thickness and the top of screen elevation. Negative values reflect the length of screen remaining above the water table.

[d] Groundwater elevation corrected for LNAPL thickness was calculated by the following formula: MRP Elevation - Depth to LNAPL/water interface + (LNAPL Thickness * Specific Gravity of Weathered JP4/JP8 Fuel) where the specific gravity of JP4/JP8 fuel is 0.7592. The specific gravity is based on the December 13, 2018 site-specific fuel testing report from PTS Laboratories using LNAPL collected from wells KAFB-106014, KAFB-106059, and KAFB-106079.

[e] Well used in analyses for both REI 4857 and 4838.

[f] This well contains a dedicated pump; therefore, a sounder was not deployed to avoid entanglement and the total depth is based on the information provided in the well completion diagram.

[g] This well was not gauged during the synoptic gauging period. The data presented here was collected prior to sampling and is provided for informational purposes only.

[h] This well was not gauged during the synoptic gauging period. Gauging was attempted prior to sampling, but dedicated equipment in the well prevented the interface probe from reaching groundwater level.

[i] Well not permanently designated in REI listed.

[j] Well was gauged and found to be dry in Q2 2021.

[k] Gauging at this newly installed piezometer will begin in Q3 2021.

-- = well was designed with the screened interval fully submerged to capture conditions at depths below the water table

— = LNAPL not detected

AMSL = above mean sea level

ft = foot/feet

ID = identification

JP = jet propellant

LNAPL = light non-aqueous phase liquid

MRP = measurement reference point

NM = not measured

Q2 = second quarter

Q3 = third quarter

Q4 = fourth quarter

REI = reference elevation interval

Table 5-2
Changes in Groundwater Elevations and LNAPL Thicknesses

Well Location ID	Reference Elevation Interval (ft AMSL)	Q2 2020			Q4 2020			Q2 2021			Difference between Q2 2021 and Q4 2020		Difference between Q2 2021 and Q2 2020

Table 5-2
Changes in Groundwater Elevations and LNAPL Thicknesses

[a] Groundwater elevation corrected for LNAPL thickness was calculated using the following formula: MRP Elevation - Depth to LNAPL/water interface + (LNAPL Thickness * Specific Gravity of Weathered JP4/JP8 Fuel). A specific gravity of 0.7592 is used, based on the December 13, 2018 site-specific fuel testing report from PTS Laboratories using LNAPL collected from wells KAFB-106014, KAFB-106059, and KAFB-106079.

[b] Well used in analyses for both REI 4857 and 4838.

[c] Well within immediate proximity of groundwater extraction well KAFB-106228, which was pumping during gauging in Q2 2020, Q4 2020, and Q2 2021.

[d] Well was not gauged during the synoptic gauging events due to presence of monitoring equipment. Gauging occurred prior to sampling and is presented here for informational purposes only. Data was not used in the creation of potentiometric surface maps or for performance assessment.

[e] In Q2 2021, gauging was attempted prior to sampling, but dedicated equipment in the well prevented the interface probe from reaching groundwater level.

[f] Well within immediate proximity of groundwater extraction well KAFB-106233, which was pumping during gauging in Q4 2020 and Q2 2021, and was off during gauging in Q2 2020.

[g] Well within immediate proximity of drinking water supply well KAFB-003, which was in operation during Q2 2020, Q4 2020, and Q2 2021. While in operation, the pump typically runs from 0700 to 1300 and 2000 to 0100, but may run for additional hours as needed.

[h] The bottom of the screened interval in KAFB-106211 is near the top of the water table. Due to changing water levels, KAB-106211 was dry in Q4 2020 and Q2 2021, but had measurable water column in Q2 2020.

- = LNAPL not detected in either quarter
AMSL = above mean sea level
ft = foot/feet
ID = identification
JP = jet propellant
LNAPL = light non-aqueous phase liquid
MRP = measurement reference point
NA = not applicable
Q2 = second quarter
Q4 = fourth quarter
REI = reference elevation interval

[a] Field parameters are collected at wells sampled using low-flow methodology. Field parameters are not collected at wells sampled using passive methodology, and therefore those wells are not presented in this table.

°C = degrees Celsius
µS/cm = microSiemens per centimeter
DO = dissolved oxygen
ID = identification
mg/L = milligram per liter
NA = not applicable
mV = millivolt
NTU = nephelometric turbidity unit
ORP = oxidation reduction potential
Q2 = second quarter
Spec. Cond. = specific conductivity
S.U. = standard unit

Alkalinity	Method SM2320B (mg/L)	Alkalinity, bicarbonate (as $CaCO_3$)	NS	NS	NS	NS	91	--	6	270	--	6
		Alkalinity, carbonate (as $CaCO_3$)	NS	NS	NS	NS	ND	U	6	ND	U	6
		Alkalinity, total (as $CaCO_3$)	NS	NS	NS	NS	91	--	6	270	--	6

Table 5-4
Groundwater Analytical Results for Wells within the Baseline Period, Q2 2021

[a] NM WQCC numeric standards per the NMAC Title 20.6.2.3101A, Standards for Ground Water of 10,000 mg/L Total Dissolved Solids Concentration or Less (NMAC 2018). For metals, the NM WQCC numeric standard applies to dissolved metals.
[b] EPA National Primary Drinking Water Regulations, MCLs and Secondary MCLs, Title 40CFR Part 141, 143 (May 2018).
[c] EPA Region 6 RSL for Tapwater (May 2021) for hazard index = 1.0 for noncarcinogens and a 10-5 cancer risk level for carcinogens.
[d] The project screening level was selected to satisfy the requirements of the Kirtland AFB Hazardous Waste Permit Number NM9570024423 as the lowest of (1) NM WQCC numeric standard or (2) EPA MCL. If no NM WQCC standard or MCL exists for any analyte, then the project screening level is the EPA RSL.
[e] The project screening level has been raised to the laborotory limit of detection for this analyte since the laboratory is unable to achieve the EPA tapwater RSL due to method limitations. This analyte is not considered to be a site constituent of concern.
[f] Based on the geochemical equilibrium of the site groundwater and previous site data analyses, nitrate/nitrite results represent nitrate concentrations.
µg/L = microgram per liter
AMSL = above mean sea level
bgs = below ground surface
CFR = Code of Federal Regulations
DRO = diesel range organics
EDB = 1,2-dibromoethane (ethylene dibromide)
EPA = U.S. Environmental Protection Agency
ft = foot (feet)
GRO = gasoline range organics
ID = identification
LOD = limit of detection
MCL = maximum contaminant level
mg/L = milligrams per liter
ND = not detected
NM = New Mexico
NMAC = New Mexico Administrative Code
NS = not specified
Q2 = second quarter
REG = normal field sample
RSL = regional screening level
TPH = Total petroleum hydrocarbons
Val Qual = validation qualifier
VOCs = Volatile organic compounds
WQCC = Water Quality Control Commission
Shading = detected concentrations
Bold/Shading = concentrations exceed the project screening level
Val Quals based on independent data validation:
-- = Validation qualifier not assigned.
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.
J+ = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated, biased high.
J- = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated, biased low.
U = Qualifier denotes the analyte was analyzed but not detected.

Table 5-5
Groundwater Analytical Results for EDB and BTEX for Groundwater Monitoring Wells, Q2 2021

[a] NM WQCC numeric standards per the NMAC Title 20.6.2.3101A, Standards for Ground Water of 10,000 mg/L Total Dissolved Solids Concentration or Less (NMAC 2018). For metals, the NM WQCC numeric standard applies to dissolved metals.

[b] EPA National Primary Drinking Water Regulations, MCLs and Secondary MCLs, Title 40CFR Part 141, 143 (May 2018).

[c] EPA Region 6 RSL for Tapwater (May 2021) for hazard index = 1.0 for noncarcinogens and a 10-5 cancer risk level for carcinogens.

[d] The project screening level was selected to satisfy the requirements of the Kirtland AFB Hazardous Waste Permit Number NM9570024423 as the lowest of (1) NM WQCC numeric standard or (2) EPA MCL. If no NM WQCC standard or MCL exists for any analyte, then the project screening level is the EPA RSL.

[e] The project screening level has been raised to the laborotory limit of detection.

[f] Based on the geochemical equilibrium of the site groundwater and previous site data analyses, nitrate/nitrite results represent nitrate concentrations.

µg/L = microgram per liter
— = Compound not analyzed.
AFB = Air Force Base
AMSL = above mean sea level
bgs = below ground surface
BTEX = benzene, toluene, ethylbenzene, and total xylenes
CFR = Code of Federal Regulations
EDB = 1,2-dibromoethane (ethylene dibromide)
EPA = U.S. Environmental Protection Agency
ft = foot (feet)
ID = identification
LOD = limit of detection
MCL = maximum contaminant level
ND = not detected
NM = New Mexico
NMAC = New Mexico Administrative Code
Q2 = second quarter
REG = normal field sample
RSL = regional screening level
Val Qual = validation qualifier
WQCC = Water Quality Control Commission
Shading = detected concentrations
Bold/Shading = concentrations exceed the project screening level
Val Quals based on independent data validation:
-- = Validation qualifier not assigned.
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.
U = Qualifier denotes the analyte was analyzed but not detected.

Table 5-6
Historical EDB Concentrations

[a] The project screening level was selected to satisfy the requirements of the Kirtland AFB Hazardous Waste Permit Number NM9570024423 as the lowest of (1) NM WQCC numeric standard or (2) EPA MCL. If no NM WQCC standard or MCL exists for any analyte, then the project screening level is the EPA RSL. For EDB, the EPA MCL and the NM WQCC numeric standard are both 0.05 µg/L.

[b] Data presented includes results from the current quarter along with the three most recent historical results. Where wells do not have at least three historical results, the results from each quarter of sampling are provided.

[c] This well was not sampled in Q4 2019 due to suspected biofouling in the well.

[d] Wells initially installed for vadose zone characterization. These wells were added to the GWM network to temporarily fill a data gap as the water level rose across the site.

[e] This well has fewer than three historical results.

µg/L = microgram per liter
AFB = Air Force Base
EDB = 1,2-dibromoethane (ethylene dibromide)
EPA = U.S. Environmental Protection Agency
ID = identification
LOD = limit of detection
MCL = maximum contaminant level
ND = not detected
NM = New Mexico
Q1 = first quarter
Q2 = second quarter
Q3 = third quarter
Q4 = fourth quarter
RSL = regional screening level
Val Qual = validation qualifier
WQCC = Water Quality Control Commission
Shading = detected concentrations.
Bold/Shading = concentrations exceed the project screening level.
Val Quals based on independent data validation:
-- = Validation qualifier not assigned.
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.
U = Qualifier denotes the analyte was analyzed but not detected.

Table 5-7
Historical BTEX Concentrations

[a] The project screening level was selected to satisfy the requirements of the Kirtland AFB Hazardous Waste Permit Number NM9570024423 as the lowest of (1) NM WQCC numeric standard or (2) EPA MCL. If no NM WQCC standard or MCL exists for any analyte, then the project screening level will be the EPA Tapwater RSL. For benzene, ethylbenzene, and toluene, the project screening level is the EPA MCL. For total xylenes, the project screening level is the NM WQCC numeric standard.

[b] Data presented include results from the current quarter along with the three most recent historical results. Where wells do not have at least three historical results, the results from each quarter of sampling are provided.

µg/L = microgram per liter
AFB = Air Force Base
BTEX = benzene, toluene, ethylbenzene, and total xylenes
EPA = U.S. Environmental Protection Agency
ID = identification
LOD = limit of detection
MCL = maximum contaminant level
ND = not detected
NM = New Mexico
Q1 = first quarter
Q2 = second quarter
Q3 = third quarter
Q4 = fourth quarter
RSL = regional screening level
Val Qual = validation qualifier
WQCC = New Mexico Water Quality Control Commission
Shading = detected concentrations
Bold = concentrations exceed the project screening level
Val Quals based on independent data validation:
-- = Validation qualifier not assigned.
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.
U = Qualifier denotes the analyte was analyzed but not detected.

Table 5-8
Groundwater Analytical Results for Inorganic Compounds for Groundwater Monitoring Wells, Q2 2021

[a] NM WQCC numeric standards per the NMAC Title 20.6.2.3101A, Standards for Ground Water of 10,000 mg/L Total Dissolved Solids Concentration or Less (NMAC 2018). For metals, the NM WQCC numeric standard applies to dissolved metals.

[b] EPA National Primary Drinking Water Regulations, MCLs and Secondary MCLs, Title 40CFR Part 141, 143 (May 2018).

[c] EPA Region 6 RSL for Tapwater (May 2021) for hazard index = 1.0 for noncarcinogens and a 10-5 cancer risk level for carcinogens.

[d] The project screening level was selected to satisfy the requirements of the Kirtland AFB Hazardous Waste Permit Number NM9570024423 as the lowest of (1) NM WQCC numeric standard or (2) EPA MCL. If no NM WQCC standard or MCL exists for any analyte, then the project screening level is the EPA RSL.

[e] Based on the geochemical equilibrium of the site groundwater and previous site data analyses, nitrate/nitrite results represent nitrate concentrations.

µg/L = microgram per liter
— = Compound not analyzed.
AFB = Air Force Base
AMSL = above mean sea level
bgs = below ground surface
BTEX = benzene, toluene, ethylbenzene, and total xylenes
CFR = Code of Federal Regulations
EDB = 1,2-dibromoethane (ethylene dibromide)
EPA = U.S. Environmental Protection Agency
ft = foot (feet)
ID = identification
LOD = limit of detection
MCL = maximum contaminant level
ND = not detected
NM = New Mexico
NMAC = New Mexico Administrative Code
Q2 = second quarter
REG = normal field sample
RSL = regional screening level
Val Qual = validation qualifier
WQCC = Water Quality Control Commission
Shading = detected concentrations
Bold/Shading = concentrations exceed the project screening level
Val Quals based on independent data validation:
-- = Validation qualifier not assigned.
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.
U = Qualifier denotes the analyte was analyzed but not detected.

Table 6-2
Drinking Water Supply Well Semi- Annual Analytical Results for Inorganic Compounds, Q2 2021

[a] NM WQCC numeric standards per the NMAC Title 20.6.2.3101A, Standards for Ground Water of 10,000 mg/L Total Dissolved Solids Concentration or Less (NMAC 2018).

[b] EPA National Primary Drinking Water Regulations, MCLs and Secondary MCLs, Title 40CFR Part 141, 143 (May 2018).

[c] EPA Region 6 RSL for Tapwater (May 2021) for hazard index = 1.0 for non-carcinogens and a 10-5 cancer risk level for carcinogens.

[d] The project screening level was selected to satisfy the requirements of the Kirtland AFB Hazardous Waste Permit Number NM9570024423 as the lowest of (1) NM WQCC numeric standard or (2) EPA MCL. If no NM WQCC numeric standard or MCL exists for any analyte, then the project screening level will be the EPA RSL.

[e] The analytical method utilized to analyze for total nitrate/nitrite nitrogen concentrations (Method 353.2) cannot identify individual nitrate and nitrite concentrations without modification. Typically, in highly oxidizing and near neutral aquifers, nitrate is the primary nitrogen species found in groundwater (Langmuir, 1997). Previous studies in the Albuquerque Basin have used total nitrate/nitrite nitrogen concentrations as equivalent to nitrate nitrogen concentrations (Longmire, 2016; Anderholm et al., 1995). Therefore, total nitrate/nitrite nitrogen concentrations were compared to screening levels for nitrate in this report.

µS/cm = micro siemens per centimeter
ºC = degree Celsius
AFB = Air Force Base
CFR = Code of Federal Regulations
DO = dissolved oxygen
EPA = U.S. Environmental Protection Agency
GW = groundwater
ID = identification
LOQ = limit of quantitation
MCL = maximum contaminant level
mg/L = milligram per liter
mV = millivolt
ND = nondetect
NM = New Mexico
NMAC = New Mexico Administrative Code
NS = not specified
NTU = nephelometric turbidity unit
ORP = oxidation reduction potential
Q2 = second quarter
REG = normal field sample
RSL = regional screening level
S.U. = standard units
VA = U.S. Department of Veterans Affairs
Val Qual = validation qualifier
WQCC = Water Quality Control Commission
Shading = detected concentrations
Bold = concentrations exceed the project screening level
Val Quals based on independent data validation:
-- = Validation qualifier not assigned.
U = Qualifier denotes the analyte was analyzed but not detected.
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.

Table 7-1
Groundwater Treatment System Extraction Well Performance, Q2 2021

[a] Flow rate calculation is an average rate that only includes time while the pump was operational; average values were computed from daily values throughout Q2 2021.

[b] Ranges are provided from daily values throughout Q2 2021.

[c] Average drawdown is calculated from the approximate static water elevation in Q2 2021, only includes time while the pump was operational and does not account for dynamic water elevation increases in the aquifer; average values were computed from daily values throughout Q2 that were obtained from the SCADA for all the extraction wells.

[d] Specific capacity and transmissivity average values only include pump run time (i.e., pump down time is not factored into the calculation); average values were computed from daily values throughout Q2.

[e] Percent run time is calculated when the given well is running at a minimum of 50 gpm; dataset includes readings for every minute throughout Q2.

[f] Combined Average Operation Flow Rate is the average influent flow rate to the GWTS.

[g] The combined extraction well percent run time is based on the percentage of time that water is entering the GWTS from any combination of extraction wells.

[h] Run time percentages for the combined extraction wells are recognized as the maximum extraction well run (from any given extraction well) time for that month.

% = percent

AMSL = above mean sea level.

ft = foot/feet

gpd = gallon per day

gpm = gallon per minute

GWTS = groundwater treatment system

ID = identification

max = maximum

min = minimum

NA = not applicable

Q2 = second quarter

SCADA = supervisory control and data acquisition

[a] Injection well KAFB-106IN2 became active on November 13, 2020.

[b] Corrected volumes from human machine interface datasets.

[c] Flow meters are inspected monthly, see Appendix I-1.

[d] Train 1 treatment volume for December 2015 includes all water treated by the temporary treatment system and water treated by Train 1 during December 201

[e] On March 14, 2018 at 0206, the KAFB-7 V-Smart valve hydraulic assembly failed downhole. Repairs to KAFB-7 were completed on November 14, 2018. All treated water between March 14, 2018 and November 15, 2018 was discharged to the GCMP.

[f] Cumulative 2021 treated volume calculated through June 28, 2021.

FE/FIT-3208 = Flow meter/flow meter transmitter (followed by the component designation)

GCMP = Golf Course Main Pond

GWTS = groundwater treatment system

Q2 = second quarter

-- = not applicable. Injection began at KAFB-106IN2 in November 2020.

Table 7-3
Groundwater Treatment System Injection Well Performance, Q2 2021

Well ID	Well Parameter	April	May	June	Q2 (average)
KAFB-7	Average Operational Flow Rate[a] (gpm)	594.4	601.1	0.0	595.9
	Flow Rate Range[b] (gpm; min-max)	588.2 - 601.1	598.3 - 603.1	0.0-0.0	588.2 - 603.1
	Volume Injected[c] (gal)	5,658,700	1,609,200	0.0	2,422,633
	Average Water Level Elevation[d] (ft AMSL)	4901.5	4886.2	4,882.8	4890.3
	Water Level Elevation Range[d] (ft AMSL; min-max)	4883.0 - 5015.5	4882.8 - 4921.2	4882.8 - 4882.8	4882.8 - 5015.5
	Run Time %[e]	19.3%	8.4%	0.0%	9.2%
	Notes	NA	NA	NA	NA
KAFB-106IN2	Average Operational Flow Rate[a] (gpm)	572.0	555.4	555.4	564.9
	Flow Rate Range[b] (gpm; min-max)	554.5 - 699.1	554.4 - 577.4	554.7 - 557.4	554.4 - 699.1
	Volume Injected[c] (gal)	4,833,100	2,970,100	2,520,500	3,441,233
	Average Water Level Elevation[d] (ft AMSL)	4912.0	4862.3	4883.6	4890.8
	Water Level Elevation Range[d] (ft AMSL; min-max)	4862.3 - 4998.4	4877.2 - 4913.9	4875.7 - 4937.9	4862.3 - 4998.4
	Run Time %[e]	13.2%	11.9%	7.1%	10.7%
	Notes	NA	NA	NA	NA

Table 7-3
Groundwater Treatment System Injection Well Performance, Q2 2021

Well ID	Well Parameter	April	May	June	Q2 (average)
GWTS Effluent	Average Operational Flow Rate[a] (gpm)	556.1	555.5	556.1	555.9
	Flow Rate Range[b] (gpm; min-max)	555.0 - 558.1	550.1 - 561.8	554.6 - 561.0	550.1 - 561.8

[a] Flow rate calculation is an average rate that only includes time while the system was operational; average values were computed from SCADA values throughout Q2 2021.

[b] Ranges are provided from SCADA values throughout Q2 2021. KAFB-7 and KAFB-106IN2 flow rates fluctuate due to surging, etc. and are not consistent with GWTS effluent flow rates.

[c] Volume injected is calculated using totalizer readings from flow meters installed on the GWTS effluent skids. June injection volume calculated through June 28, 2021.

[d] Water level elevation averages and ranges include times when injection wells are not being utilized and data was collected from the SCADA for Q2 2021.

[e] Percent run time is calculated when the given well is running at a minimum of 50 gpm; dataset includes readings for every minute throughout Q2.

% = percent
AMSL = above mean sea level
BFF = Bulk Fuels Facility
ft = foot/feet
gal = gallon(s)
gpm = gallons per minute
GWTS = groundwater treatment system
ID = identification
max = maximum
min = minimum
NA = not applicable
SCADA = supervisory control and data acquisition
Q2 = second quarter

Table 7-4
Monthly Groundwater Treatment System Performance Analytical Results for Train 1, Q2 2021

[a] NM WQCC numeric standards per the New Mexico Administrative Code Title 20.6.2.3101A, Standards for Groundwater of 10,000 mg/L Total Dissolved Solids Concentration or Less (NMAC, 2018).

[b] EPA National Primary Drinking Water Regulations, MCLs and Secondary MCLs, Title 40CFR Part 141, 143 (May 2018).

[c] EPA Region 6 RSL for Tapwater (November 2020) for hazard index = 1.0 for noncarcinogens and a 10-5 cancer risk level for carcinogens.

[d] The project screening level was selected to satisfy the requirements of the Kirtland AFB Hazardous Waste Permit Number NM9570024423 as the lowest of (1) NM WQCC numeric standard or (2) EPA MCL. If no NM WQCC numeric standard or MCL exists for any analyte, then the project screening level is the EPA RSL.

µg/L = microgram per liter
µS/cm = microSiemens per centimeter
ºC = degree Celsius
AFB = Air Force Base
DO = dissolved oxygen
EDB = 1,2-dibromoethane (ethylene dibromide)
EPA = U.S. Environmental Protection Agency
ID = identification
LOD = limit of detection
MCL = maximum contaminant level
mg/L= milligram per liter
mV = millivolt
NA = not applicable
ND = nondetect
NM = New Mexico
NMAC = New Mexico Administrative Code
NS = not sampled
ORP = oxidation reduction potential
Q2 = second quarter
REG = normal field sample
RSL = regional screening level
Spec Cond = specific conductivity
S.U. = standard unit
Val Qual = validation qualifier
VOC = volatile organic compound
WQCC = Water Quality Control Commission
Validation Qualifiers based on independent data validation:
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.
U = Qualifier denotes the analyte was analyzed but not detected.

Table 7-5
Monthly Groundwater Treatment System Performance Analytical Results for Train 2, Q2 2021

[a] NM WQCC numeric standards per the New Mexico Administrative Code Title 20.6.2.3101A, Standards for Groundwater of 10,000 mg/L Total Dissolved Solids Concentration or Less (NMAC, 2018).

[b] EPA National Primary Drinking Water Regulations, MCLs and Secondary MCLs, Title 40CFR Part 141, 143 (May 2018).

[c] EPA Region 6 RSL for Tapwater (November 2020) for hazard index = 1.0 for noncarcinogens and a 10-5 cancer risk level for carcinogens.

[d] The project screening level was selected to satisfy the requirements of the Kirtland AFB Hazardous Waste Permit Number NM9570024423 as the lowest of (1) NM WQCC numeric standard or (2) EPA MCL. If no NM WQCC numeric standard or MCL exists for any analyte, then the project screening level is the EPA RSL.

µg/L = microgram per liter
µS/cm = microSiemens per centimeter
ºC = degree Celsius
AFB = Air Force Base
DO = dissolved oxygen
EDB = 1,2-dibromoethane (ethylene dibromide)
EPA = U.S. Environmental Protection Agency
ID = identification
LOD = limit of detection
MCL = maximum contaminant level
mg/L= milligram per liter
mV = millivolt
NA = not applicable
ND = nondetect
NM = New Mexico
NMAC = New Mexico Administrative Code
NS = not sampled
ORP = oxidation reduction potential
Q2 = second quarter
REG = normal field sample
RSL = regional screening level
Spec Cond = specific conductivity
S.U. = standard unit
Val Qual = validation qualifier
VOC = volatile organic compound
WQCC = Water Quality Control Commission
Shading = detected concentrations
Val Quals based on independent data validation:
-- = validation qualifier not assigned.
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.
U = Qualifier denotes the analyte was analyzed but not detected.

Table 7-6
Extraction Well Analytical Results, Q2 2021

[a] NM WQCC numeric standards per the NMAC Title 20.6.2.3101A, Standards for Ground Water of 10,000 mg/L Total Dissolved Solids Concentration or Less (NMAC 2018). For metals, the NM WQCC numeric standard applies to dissolved metals.

[b] EPA National Primary Drinking Water Regulations, MCLs and Secondary MCLs, Title 40CFR Part 141, 143 (May 2018).

[c] EPA Region 6 RSL for Tapwater (May 2021) for hazard index = 1.0 for noncarcinogens and a 10-5 cancer risk level for carcinogens.

[d] The project screening level was selected to satisfy the requirements of the Kirtland AFB Hazardous Waste Permit Number NM9570024423 as the lowest of (1) NM WQCC numeric standard or (2) EPA MCL. If no NM WQCC standard or MCL exists for an analyte, then the project screening level is the EPA RSL.

µg/L = microgram per liter
AFB = Air Force Base
AMSL = above mean sea level
BTEX = benzene, toluene, ethylbenzene, and total xylenes
CFR = Code of Federal Regulations
EDB = 1,2-dibromoethane (ethylene dibromide)
EPA = U.S. Environmental Protection Agency
ft = foot (feet)
ID = identification
LOD = limit of detection
MCL = maximum contaminant level
mg/L = milligrams per liter
ND = not detected
NM = New Mexico
NMAC = New Mexico Administrative Code
NS = not specified
Q2 = second quarter
REG = normal field sample
RSL = regional screening level
Val Qual = validation qualifier
WQCC = Water Quality Control Commission
Shading = detected concentrations
Bold/Shading = reported concentrations exceed the project screening level

Validation Qualifiers based on independent data validation:

-- = Validation qualifier not assigned.
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.
U = Qualifier denotes the analyte was analyzed but not detected.

Q2 2021 Total				68,538,600			1,175

Table 7-7
Groundwater Treatment System EDB Removal, Q2 2021

[a] Monthly date ranges may include dates falling outside of the actual month as weekly human machine interface data retrievals occur every Monday.

[b] The analytical result from the most recent monthly sample is used for the influent EDB concentration (Tables 7-5 and 7-6). Where EDB is non-detect, a concentration of 0 is used for the purpose of mass calculation and is displayed in this table as ND < [LOD].

[c] The mass of EDB removed is the sum of the weekly mass of EDB removed, which is the influent EDB concentration multiplied by the weekly treated volume, which is calculated each Monday from the difference in effluent totalizer readings since the previous Monday.

< = less than
µg/L = microgram per liter
EDB = 1,2-dibromomethane (ethylene dibromide)
gal = gallon(s)
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.
LOD = limit of detection
mg = milligram
ND = non-detect
Q2 = second quarter .

Table 7-8
Groundwater Treatment System Routine Maintenance Schedule, Q2 2021

	Frequency			
Maintenance Activity	**Daily**	**Weekly**	**Monthly**	**As Needed**
Recording and inspecting influent, GAC vessel, and effluent skid pressure, flow rate, and totalizer readings from their respective gauges and the human machine interface	X			
Recording extraction well pressure, flow rate, and totalizer readings from the human machine interface	X			
Recording extraction well pressure, flow rate, and totalizer readings from the gauges at the well vaults		X		
Inspecting well control house and recording well control house pressure, flow rate, and totalizer readings		X		
Recording totalizer reading at KAFB-7 and KAFB-106IN2		X		
Running and inspecting the GWTS air compressor		X		
Inspecting extraction well, conveyance line, and air release valve vaults			X	
Inspecting wellhead and associated equipment of injection well KAFB-7 and KAFB-106IN2			X	
Inspecting and performing maintenance of flowmeters throughout the system			X	
Inspecting and performing maintenance on actuating valves throughout the system			X	
Performing confined space entries			X	
Gauging extraction well filter pack			X	
Testing of uninterruptible power supplies			X	
Semiannual inspections and maintenance of Tijeras Arroyo Golf Course ponds				X
Logging lockout-tagout entries				X
Logging system shutdowns				X
Emptying stormwater runoff flooded vaults				X
Performing air compressor maintenance				X
Cleaning GWTS sumps				X
Draining air release valve containment vessels				X
Grounds keeping including vegetation control				X
Inspecting and cleaning the GWTS Wye-strainer/basket strainer				X
Performing flow meter calibration				X[a]
Greasing pump bearings				X[b]
Changing process pump oil				X[b]
Changing air filter on control room air conditioner				X[b]
Changing bag filters				X[c]
Changing out GAC				X[d]
Disinfection of extraction wells and conveyance lines				X[e]
Testing of alarms and interlocks				X[f]
Cleaning coils and replacing air filter for the Well Control House air conditioner				X[g]
GAC skimming of the lead GAC vessel				X[h]

Table 7-8
Groundwater Treatment System Routine Maintenance Schedule, Q2 2021

[a] Flowmeters are calibrated at a minimum of once per year, but may be calibrated more often as needed.

[b] Changing of process pump oil, greasing pump bearings, and replacing the air filter in the air conditioning unit are required every 3 months, but may be changed more often as needed.

[c] Bag filters are scheduled for change out when the pressure differential across a bag filter vessel exceeds 4 psid

[d] GAC is scheduled for change out when any regulated constituent leaving the lead GAC vessel reaches 90% of the discharge limit.

[e] Disinfection of extraction wells and conveyance lines occurs on an as needed basis.

[f] Testing of alarms and interlocks occurs semi-annually or more often as needed.

[g] Cleaning of the coil and replacing of the air filter are scheduled as quarterly activities, but frequency may be adjusted as necessary.

[h] GAC skimming is performed when the differential pressure in the lead GAC vessel has increased from the operational differential pressure by at least 7 psid.

GAC = granular activated carbon
GWTS = groundwater treatment system
psi = pound per square inch
psid = pound per square inch differential
Q2 = second quarter

Table 7-9
Groundwater Treatment System Non-Routine Maintenance Items, Q2 2021

Date	Extent of Shutdown	Approximate Downtime (hours)	Cause of Shutdown
4/8/2021	KAFB-106239	0.58	VFD overcurrent
4/13/2021	GWTS	1.43	UPS testing
4/16/2021	GWTS	1.00	Faulty pressure transducer

Table 10-1
Results of Soil Vapor Monitoring Data in the 25-foot Nominal Depth Horizon, Q2 2021

µg/m^3 = microgram per cubic meter
EPA = U.S. Environmental Protection Agency
ID = identification
LOD = limit of detection
ND = not detected
NMED = New Mexico Environment Department
NS = not specified
REG = normal field sample
Val Qual = validation qualifier
VISL = vapor intrusion screening level
VOC = volatile organic compound
Shading = detected concentrations
Bold/Shading = concentrations exceed the residential VISL.
Val Quals based on independent data validation:
-- = Validation qualifier not assigned.
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.
U = Qualifier denotes the analyte was analyzed but not detected.

Table 10-12
Summary of Q2 2021 Target Capture Zone Evaluation

Step	Summary/Conclusions
Step 1: Review site data, site conceptual model, remedy objectives	Completed, all determined to be up-to-date and adequate. Added six new monitoring wells to the gauging and sampling network.
Step 2: Define TCZ	Updated and clearly defined, illustrated on maps. Does not pertain to entire thickness of aquifer. Dissolved ethylene dibromide plume volume and mass have been delineated at and above the Maximum Contaminant Level value in three dimensions. An isolated region concentration rebound around monitoring wells KAFB-106041 has persisted, and the concentration has increased (from 0.074 µg/L to 0.098 µg/L). Overall, the TCZ has undergone a 16% decrease in volume and a 8% decrease in mass when compared to the Q4 2020 delineation. This decrease is due to the removal of the bulk of the volume and mass that had accumulated around IM extraction well KAFB-106228.
Step 3a: Water level maps: Potentiometric Surface Analysis	Analysis is performed within the two reference elevation intervals shown to contain portions of the TCZ. Interpreted capture zone is larger than the TCZ within the Interim Remedy Objective Area in both reference elevation intervals. Analysis estimates 100% capture of the initial TCZ under Q2 2021 conditions.
Step 3b: Water level maps: Vertical Difference Analysis	Analysis is performed across the TCZ area at three distinct elevation intervals at depth within the aquifer. Analysis estimates containment of greater than 100% of the initial TCZ in the vertical direction under Q2 2021 conditions.
Step 3c: Water level pairs	Inward flow not evident at all pairs along the TCZ boundary within the Interim Remedy Objective Area. However, analysis does indicate the potential for entire TCZ to flow towards one or more interim measure extraction wells under Q2 2021 conditions.
Step 4: Perform Calculations	Simple two-dimensional horizontal capture calculations were performed in 2016 but are not considered to be adequate to represent capture in this system and, therefore, were not updated in this reporting effort.
Step 4b: Groundwater flow modeling with particle tracking	The Air Force has determined that capture is sufficient, modeling no longer adds value to the evaluation of the interim measure and that ongoing routine monitoring is sufficient to evaluate the future progress of the interim measure.
Step 5: Concentration trends	Updated with current water chemistry data and indicates that the plume has not migrated into previously "clean" or previously remediated aquifer. Due to rising water table elevation, this analysis is not strongly relied upon for short-term evaluation of capture.
Step 6: Interpret actual capture and Compare to TCZ	Comparison of capture estimates from Steps 3 and concentration trend comparison in Step 5 lead to the conclusion that 100% of the initial TCZ volume and mass is being contained by IM extraction under Q2 2021 groundwater conditions. Capture evaluation will continue to be performed every second and fourth quarter in order to address changes in capture zones due to changes in aquifer stresses (Interim Remedy and non-Interim Remedy based) and changes in regional flow-field.

RE: QUARTERLY MONITORING REPORT FOR APRIL-JUNE 2019
BULK FUELS FACILITY SOLID WASTE MANAGEMENT UNITS ST-106/SS-111
KIRTLAND AIR FORCE BASE, NEW MEXICO
EPA ID# NM6213820974
HWB-KAFB-19-017

Dear Colonel Miller and Lt. Colonel Acosta:

The New Mexico Environment Department (NMED) is in receipt of the Kirtland Air Force Base (Permittee) *Quarterly Monitoring Report for April-June 2019, Bulk Fuels Facility, Solid Waste Management Unit ST-106/SS-11* (Report), dated September 2019 and received September 27, 2019.

No revision to the Report is required. NMED's attached comments are intended to provide direction to the Permittee in the preparation of future quarterly monitoring reports. Necessary changes based upon NMED's comments should be incorporated into future reports. The Permittee must ensure that future monitoring reports fully comply with Kirtland Air Force Base KAFB) Hazardous Waste Facility Permit (Permit) Section 6.1.6. Quarterly Progress Reports, Section 6.2.4.1. Quarterly Reporting, and Section 6.2.4.4. Periodic Monitoring Reports. Additional guidance on preparing groundwater monitoring reports can be found in NMED's *General Reporting Requirements for Routine Groundwater Monitoring at RCRA Sites.*

Col. Miller and Lt. Col. Acosta
Quarterly Monitoring Report for April-June 2019

Col. Miller and Lt. Acosta
Quarterly Monitoring Report for April-June 2019
Attachment, Page 1 of 4

GENERAL COMMENTS:

1. Monitoring Report Contents

NMED Comment:

Based on issues identified in this Report and other periodic reports, NMED is providing the following reporting requirements which the Permittee must incorporate into future reports. Permittee is required to include the following as applicable:

a. The response to NMED's comments must be included as Appendix A of each document revision.
b. All field methods for the project must be documented in an appendix, as required by Permit Section 6.2.4.4.11. The documentation must be specific to each monitoring activity, such as soil vapor monitoring, groundwater monitoring, or operation and maintenance of the groundwater treatment system. References to quality assurance project plans (QAPPs), standard operating procedures (SOPs), or work plans are not acceptable. All deviations from approved work plans must be discussed and explained in a Deviations section.
c. Wells must be consistently referred to by the same name/designation in all periodic reports, sections of the text, tables, and figures. The designations must match those provided in the digital analytical data files.
d. Sampling data tables must include the practical quantitation limit (PQL) and listed laboratory report detection limit (RDL) for each analysis.
e. Sampling data tables must include the appropriate screening levels for data comparison.
f. Analytical data tables in digital format must include a column that indicates which analytical data report the specific sample information can be found. This link must correspond to the analytical data report file name.
g. Data quality exceptions, such as when the PQL exceeds the corresponding screening level, must be identified as such in all tables and figures (see Permit Section 6.5.18).
h. Analytical data provided in digital format such as Microsoft Excel or Access files must be provided in a sortable, searchable format. Previous reports have provided digital data in the same format as the printed tables. These tables are not sortable or searchable. Provide the tables in a standard database format.
i. Analytical data packages must be submitted in accordance with KAFB Permit Section 6.5.18.2, Laboratory Deliverables.
j. All tables, figures, and appendices must be appropriately numbered and titled.
k. Every page of every submittal, including all pages within all sections and appendices, must be numbered either sequentially or in some other format acceptable to NMED.

2. Analytical Data Detection and Quantitation Limits

NMED Comment: Many of the analytical data tables presented in the Report list the limit of detection (LOD) for each sample analysis; however, it is not clear if this value represents the laboratory method detection limit or reporting detection limit. Some tables list the LOD and some the limit of quantification (LOQ). The permittee must provide the method detection limit (MDL) in the data tables. In addition, the Permittee must include the reporting detection limit (assuming this is the Permittee's "LOD") and the PQL (assuming this is the Permittee's "LOQ") for each sample analyzed in the data tables.

The Permittee's Quality Assurance Project Plans (QAPPs) indicate that the Permittee is using three different variations of terminology for method reporting limits, including one which seems to be backwards. The Permittee's QAPP for Vadose Zone Treatability Studies Attachment 1, Tables 1-1a, Method Reporting Limits – Drinking Water, 1-1b, Method Report Limits – Soil and Investigation Derived Waste, and 1-1c, Method Reporting Limits – Volatile Organic Compounds in Air, all seemingly use LOQ appropriately (as the PQL), but there is a lack of consistency between the method detection limit and reporting detection limit.

In Table 1-1a, Drinking Water, "MDL" appears to equate to the method detection limit, and "LOD" appears to equate to the reporting detection limit. In Table 1-1b, Soil, "LOD" appears to equate to the method detection limit and "DL" appears to equate to the reporting detection limit. In Table 1-1c, Air, "DL" appears to equate to the method detection limit and "LOD" appears to equate to the reporting detection limit. Based on the fact that the PQL must be greater than the reporting detection limit and the reporting detection limit must be greater than the method detection limit, Table 1-1b, Soil, appears to be wrong. NMED is assuming that similar tables appear in the QAPP for quarterly monitoring.

These issues cause confusion for the reviewer, community stakeholders, and the public, and increases the time required to review submittals from the Permittee. The Permittee must use appropriate and consistent terms for Quality Assurance /Quality Control in all periodic reporting submittals and for all media (e.g., use MDL consistently instead of DL). While NMED does not review or approve QAPPs, the Permittee must assure that they are providing their contractors with the appropriate information to provide appropriate, consistent, and accurate information to NMED. Consistency in reporting by the Permittee will reduce both agency and Air Force internal review times.

SPECIFIC COMMENTS:

3. Table of Contents, Appendix B, page iv:

NMED Comment: Appendix B, New Activities Supporting Information, contains well completion reports for four new wells installed and developed in accordance with the NMED-approved 2017 *Work Plan for Vadose Zone Coring, Vapor Monitoring, and Water Supply Sampling*. KAFB Permit Section 6.2.2.1.2, Site Investigations-Investigation Reports,

and Section 6.2.4.3, Reporting Requirements-Investigation Reports, require that the information and data collected from all investigation activities conducted during the quarter be submitted to NMED as separate, stand-alone reports. The Permittee must submit individual reports for all investigation activities conducted in support of the ongoing investigation of the bulk fuels facility spill, rather than submit the information as appendices in quarterly reports.

4. **Section 2.5 Q2 2019 Soil Vapor Data, page 2-4:**

Permittee Statement: "The RCRA permit does not specify cleanup levels for soil vapor. The quarterly reports are not intended to assess risk; the vapor data are used to assess concentration trends. The risk assessment (USACE,2017e) compares vapor concentrations to the vapor intrusion screening levels in the NMED Risk Assessment Guidance for Site Investigations and Remediation. All EDB and benzene concentrations are compared against 3,800 and 3,200 micrograms per cubic meter (µg/m3), respectively. HC concentrations are compared against 1,000 parts per million by volume (ppmv). The comparison concentrations used in this report were determined by historical maximum and minimum soil vapor results to show which SVMPs had relatively high or low concentrations."

NMED Comment: The Permittee must clarify if the comparison values for EDB, benzene, and HC represent the historical maximum or minimum, or some other calculated value so that changes relative to the values can be evaluated. The Permittee must also provide a reference for the historical soil vapor values. The Permittee accurately states that quarterly reports are not intended to assess risk; however, the Permittee must provide a comparison of detected concentrations to a regulatory standard for the purpose of assessing the presence and location of contaminants of concern. NMED's *Risk Assessment Guidance for Site Investigations and Remediation* (2019 and as updated) vapor intrusion screening levels (VISLs) must be used as a first-tier screening assessment.

5. **Section 2.2 Bioventing Pilot Test, page 2-2:**

Permittee Statement: "A bioventing report will be submitted on January 31, 2020 as requested by NMED in a letter dated February 25, 2019 (NMED, 2019). This report will include data collected up to Q4 2019. Data collected after Q4 2019 will be provided in the relevant quarterly monitoring reports. The Q4 2020 Quarterly and Annual Monitoring Report will include results to date, and the final results of the bioventing pilot test will be provided in the Q4 2021 Quarterly and Annual Monitoring Report."

NMED Comment: Bioventing pilot test data is collected each quarter; therefore, the Permittee must provide quarterly data updates in separate quarterly status reports specific to the bioventing pilot study to allow NMED to provide timely adjustment and inputs to the bioventing system. The final results of the bioventing pilot test must be submitted as a stand-alone document rather than as an appendix to the Q4 2021 Quarterly and Annual

Monitoring Report.

6. **Section 3.3.1 Sampling Deviations, page 3-3:**

Permittee Statement: "Groundwater samples were not obtained from seven wells in Q2 2019. Three wells (KAFB-106001, KAFB-106008, and KABF-106079) could not be sampled due to suspected biofouling. These wells will be sampled using passive sampling techniques in the future after well rehabilitation is evaluated."

NMED Comment: The Permittee must provide additional information in a subsequent quarterly report on suspected biofouling of wells KAFB-106001, KAFB-106008, and KABF-106079, such as evidence for biofouling, the source of biofouling, and the date when biofouling was first suspected. Well KABF-106079 is less than 1000ft from interim measure extraction well KAFB-106239. Provide information on the potential for suspected biofouling at KAFB-106079 to impact KAFB-106239 and the Groundwater Treatment System. The Permittee must also submit a work plan for evaluating and conducting rehabilitation of the three wells. Use of passive sampling techniques for wells KAFB-106001 and KABF-106079 is contingent upon NMED approval. Because LNAPL was previously detected in well KAFB-106008, use of passive sampling is not appropriate.

7. **Section 3.6.1.1 EDB Analytical Results, page 3-5:**

Permittee Statement: *Five EDB exceedances were from wells north of Ridgecrest Drive SE but none were north of Gibson Boulevard SE.*

NMED Comment: Figures 3-5 and 3-6 present EDB concentrations in groundwater for reference elevation 4857 and 4838, respectively. Both figures depict the northern extent of the EDB plume as being north of Gibson Boulevard SE. The Permittee must revise the statement and figures for accuracy if they are included in future periodic reports.

RE: REPORTING REQUIREMENTS FOR ALL DOCUMENT SUBMITTALS
KIRTLAND AIR FORCE BASE, NEW MEXICO
EPA ID# NM6213820974
HWB-KAFB-20-MISC

Dear Colonel Miller and Lt. Colonel Acosta:

In our discussions with Kirtland Air Force Base (KAFB or Permittee) staff, a concern was raised that New Mexico Environment Department (NMED) comments on specific submittals contained direction that more broadly applies to various activities conducted at KAFB. Your staff indicated that this creates difficulty for them in tracking directions provided by NMED. To respond to such concerns, NMED is providing the following compilation to clarify requirements for all documents submitted to NMED by the Permittee.

In general, many KAFB submittals to NMED consistently contain a substantial number of errors that should be identified during quality assurance and quality control reviews prior to submittal. In discussions with KAFB staff, NMED staff was assured that steps are being taken to review and enhance document quality control and address these recurring issues to assist NMED in expediting document reviews and to assist the public in better understanding the documents that are submitted by the Permittee.

Col. Miller and Lt. Col. Acosta
Reporting Requirements
Page 2

1. **Laboratory Deliverables:** Section 6.5.18.2, Laboratory Deliverables, of the KAFB Resource Conservation and Recovery Act (RCRA) Permit (KAFB Permit), states the requirements for analytical laboratory reporting. The section states, "[l]aboratory analytical data packages shall be prepared in accordance with EPA-established Level III or IV analytical support protocols." The final paragraph of the permit section goes on to state, "[t]he Permittee shall present summary tables of these data and Level II QC results to the Department in reports or other documents prepared in accordance with Permit Section 6.2.4. Raw analytical data, including calibration curves, instrument calibration data, data calculation work sheets, and other laboratory supporting data for samples from this project, shall be compiled and kept on file at the Facility for reference. The Permittee shall make all data available to the Department upon request." Therefore, for purposes of reporting, Level II QC results are necessary. Level III and IV data must be maintained by the Permittee to be made available upon request.

2. **General Guidelines:** NMED has included an attachment titled *General Reporting Guidelines* that provides guidance regarding its expectations of submittals to the Hazardous Waste Bureau. The Permittee must consult the guidance during document preparation.

3. **Document Scopes of Work:** In order to avoid confusion, all work plans must be written for one specific scope of work.

4. **Document Titles vs. Content:** All future document titles on cover pages must include all major scope activities incorporated within that document, including those presented in appendices. The names of all future documents and scopes of work must not change during the RCRA corrective action process (i.e., work plans through reports).

5. **Responses to NMED Comments:** Responses to NMED comments must be included as Appendix A of every document revision. Redline-strikeout versions must include <u>all</u> changes made to the corresponding revised document.

6. **Field Methods:** All field methods for the project must be documented in the text of the document or an appendix. The documentation must be specific to each monitoring activity, such as soil vapor monitoring, groundwater monitoring, or operation and maintenance of the groundwater treatment system. References to quality assurance project plans (QAPPs), standard operating procedures (SOPs), previous work plans, or other documents are not acceptable. All deviations from approved work plans must be discussed and explained in a Deviations section.

7. **Well Designations:** Wells must be consistently referred to by the same name/designation in all sections of the text, all tables, and all figures. The designation must also match that provided in the digital analytical data files.

8. **Data Tables, Figures, and Appendices:**
   - **a.** Sampling data tables must be logically arranged, either chronologically or by investigation, to facilitate location of information.
   - **b.** Sampling data tables must include the practical quantitation limit (PQL) and reporting detection limit for each analysis. Method detection limits must also be provided for each analytical method.
   - **c.** Sampling data tables must include the appropriate screening levels for data comparison.
   - **d.** Analytical data tables in digital format must include a column that indicates which analytical data report the specific sample information can be found. This link must correspond to the analytical data report file name.
   - **e.** Data from analyses where the PQL (or LOQ) exceeds 20% of the screening level are data quality exceptions and must be identified as such in all tables and figures.
   - **f.** Analytical data provided in digital format such as Excel files must be provided in a sortable, searchable format that can be uploaded into a database. Previous reports have provided digital data in the same format as the tables in the text which are not sortable or searchable.
   - **g.** Data in tables and figures must be presented with a consistent and appropriate number of significant figures.
   - **h.** All points (wells), structures, infrastructure, roads, etc. depicted on figures must be labeled.
   - **i.** All tables, figures, and appendices must be appropriately numbered and titled.
   - **j.** All figures must include a scale and a north arrow.
   - **k.** Data tables and figures must undergo quality assurance and quality control review prior to submittal to NMED.

9. **Document organization:** Every page of each submittal, including all pages within all sections and appendices, must be numbered either sequentially or in some other logical format.

Many of the issues listed above were discussed during a conference call between NMED and KAFB that was held on May 7, 2020; KAFB staff stated that they understood these issues and agreed to correct these problems. While NMED made every attempt to be comprehensive, other issues may arise. If NMED identifies further issues that occur in multiple submittals, NMED will contact KAFB staff informally to discuss the issues and follow up with further correspondence and direction.

Col. Miller and Lt. Col. Acosta
Reporting Requirements

GENERAL REPORTING GUIDELINES

1. Overview

The purpose of this guidance document is to provide the general requirements and formats for documents related to corrective action activities required under the Resource Conservation and Recovery Act (RCRA). This guidance is not intended to provide document requirements for every potential corrective action conducted at the facility. Therefore, the formats for all types of documents are not presented below. The formats described include the general reporting requirements and formats for site-specific investigation work plans, investigation reports, routine monitoring reports, risk assessment reports, and corrective measures evaluations. Permittees should generally consider the documents to be the equivalents of RCRA facility investigation (RFI) work plans, RFI reports, periodic monitoring reports, risk assessments, and corrective measures study (CMS) reports, respectively, for the purposes of RCRA compliance. Permittees must include detailed, site-specific requirements in all interim status unit, solid waste management unit (SWMU), and Area of Concern (AOC) investigation work plans, investigation reports, monitoring reports, and corrective measures evaluations. All plans and reports should be prepared with technical and regulatory input from the NMED. All work plans and reports must be submitted to the NMED in the form of two paper copies and an electronic copy.

The document requirements listed do not include all sections that may be necessary to complete each type of document listed. A permittee or the NMED may determine that additional sections are required to address additional site-specific issues or information collected during corrective action or monitoring activities not listed below. However, permittees must submit variations of the general report format and the formats for documents not listed in this guidance in outline form to the NMED for approval prior to submittal of the documents. The NMED will approve or disapprove, in writing, the proposed document outline after receipt of the outline. If the NMED disapproves the report outline, the NMED will notify the permittee, in writing, of the outline's deficiencies and will specify a date for submittal of a revised report outline. All documents submitted by the Permittee must follow the general approach and limitations for data presentation described in this guidance document. If in conflict with a facilities RCRA Permit, the Permit condition should be followed.

2. Investigation Work Plan

Permittees must fulfill the requirements for preparation of work plans for unit-specific or corrective action activities at the facility using the general outline below. The minimum requirements for describing proposed activities within each section are included. All research, locations, depths and methods of exploration, field procedures, analytical analyses, data collection methods, and schedules must be included in each work plan. In general, interpretation of data acquired during previous investigations must be presented only in the background sections of the work plans. The other text sections of the work plans must be reserved for presentation of anticipated site-specific activities and procedures relevant to the project. The general work plan outline is provided below.

2.1 Title Page

The title page must include the type of document, facility name and the unit, SWMU, or AOC name(s) and the submittal date. A signature block providing spaces for the name, title, and organization of the preparer and the responsible representative of the facility must be provided on the title page in accordance with the signature requirements in 40 CFR 270.11(b).

2.2 Executive Summary (Abstract)

The executive summary (or abstract) must provide a brief summary of the purpose and scope of the investigation to be conducted at the subject site. The facility, unit, SWMU, or AOC name, revision number if applicable, and location must be included in the executive summary.

2.3 Table of Contents

The table of contents must list all text sections and subsections, tables, figures, and appendices or attachments included in the work plan. The corresponding page numbers for the titles of each section of the work plan must be included in the table of contents.

2.4 Introduction

The introduction must include the facility name, unit name and location, and unit status (e.g., active operations, closed, corrective action). General information on the current site usage and status must be included in this section. A brief description of the purpose of the investigation and the type of site investigation to be conducted must be provided in this section.

2.5 Background

The background section must describe relevant background information. This section must briefly summarize historical site uses including the locations of current and former site structures and features. A labeled figure must be included in the document showing the locations of current and former site structures and features. The locations of pertinent subsurface features such as pipelines, underground tanks, utility lines, and other subsurface structures must be included in the background summary and labeled on the site plan.

This section must identify potential receptors, including groundwater, and include a brief summary of the type and characteristics of all waste and all contaminants, the known and possible sources of contamination, the history of releases or discharges of contamination, and the known extent of contamination. This section must include brief summaries of results of previous investigations, including references to pertinent figures, data summary tables, and text in previous reports. At a minimum, detections of contaminants encountered during previous investigations must be presented in table format, with an accompanying figure showing sample locations. References to previous reports must include page, table, and figure numbers for referenced information. Summary data tables and site plans showing relevant investigation locations must be included in the Tables and Figures sections of the document, respectively.

2.6 Site Conditions

2.6.1 Surface Conditions

A section on surface conditions must provide a detailed description of current site topography, features, and structures including a description of drainages, vegetation, erosional features, and a detailed description of current site uses and operations at the site. In addition, descriptions of features located in surrounding sites that may have an impact on the subject site regarding sediment transport, surface water runoff, or contaminant fate and transport must be included in this section.

2.6.2 Subsurface Conditions

A section on subsurface conditions must provide a brief, detailed description of the site conditions observed during previous subsurface investigations, including relevant soil horizons, stratigraphy, presence of vadose zone fluids and groundwater, and other relevant information. A site plan showing the locations of all borings and excavations advanced during previous investigations must be included in the Figures section of the work plan. A brief description of the anticipated stratigraphic units that may be encountered during the investigation may be included in this section, if no previous investigations have been conducted at the site.

2.7 Scope of Activities

A section on the scope of activities must briefly describe a list of all anticipated activities to be performed during the investigation, including background information research, health and safety requirements that may affect or limit the completion of tasks, drilling, test pit or other excavations, well construction, field data collection, survey data collection, chemical analytical testing, aquifer testing, and IDW storage, disposal, and reporting.

2.8 Investigation Methods

A section on investigation methods must provide a description of all anticipated locations and methods for conducting the activities to be performed during the investigation. This section must include, but is not limited to, research methods, health and safety practices that may affect the completion of tasks, drilling methods, test pit or other excavation methods, sampling intervals and methods, well construction methods, field data collection methods, geophysical and land survey methods, field screening methods, chemical analytical testing, materials testing, aquifer testing, pilot testing, and other proposed investigation and testing methods. This information may also be summarized in table format, if appropriate.

2.9 Monitoring and Sampling Program

A section on monitoring and sampling must describe the anticipated monitoring and sampling program to be implemented after the initial investigation activities are completed. This section must provide a description of the anticipated vadose zone fluids, groundwater, vadose zone vapor, vadose zone moisture, and other monitoring and sampling programs to be implemented at the unit.

2.10 Schedule

A section must provide the anticipated schedule for completion of field investigation, pilot testing, and monitoring/sampling activities. In addition, this section must provide a schedule for submittal of reports and data to the NMED, including a schedule for submitting status reports, preliminary data, and the final investigation report.

2.11 Tables

The following summary tables may be included in the investigation work plans if previous investigations have been conducted at the unit. Data presented in the tables must include information on dates of data collection, analytical methods, detection limits, and significant data quality exceptions. All data tables must include only detected analytes and data quality exceptions that could potentially mask detections. The following tables must be included in investigation work plans, as applicable;

a. summaries of regulatory criteria, background, and applicable cleanup levels (may be included in the analytical data tables instead of as separate tables);

b. summaries of historical field survey location data;

c. summaries of historical field screening and field parameter measurements of soil, rock, sediments, groundwater, surface water, and air quality;

d. summaries of historical soil, rock, or sediment laboratory analytical data must include the analytical methods, detection limits, and significant data quality exceptions that could influence interpretation of the data;

e. summaries of historical groundwater elevation and depth to groundwater data. The table must include the monitoring well depths, the screened intervals in each well, and the dates and times measurements were taken;

f. summaries of historical groundwater laboratory analytical data. The analytical data tables must include the analytical methods, detection limits, and significant data quality exceptions that could influence interpretation of the data;

g. summary of historical surface water laboratory analytical data. The analytical data tables must include the analytical methods, detection limits, and significant data quality exceptions that could influence interpretation of the data;

h. summary of historical air sample screening and chemical analytical data. The data tables must include the screening instruments used, laboratory analytical methods, detection limits, and significant data quality exceptions that could influence interpretation of the data; and

i. summary of historical pilot test or other test data, if applicable, including units of measurement and types of instruments used to obtain measurements.

2.12 Figures

The following figures must be included with each investigation work plan for each site, including presentation of data where previous investigations have been conducted. All figures must include an accurate bar scale and a north arrow. An explanation must be included on each figure for all abbreviations, symbols, acronyms, and qualifiers. The following figures must be included in investigation work plans, as applicable:

a. a vicinity map showing topography and the general location of the site relative to surrounding features and properties;

b. a unit site plan that presents pertinent site features and structures, underground utilities, well locations, and remediation system locations and details; off-site well locations and other relevant features must be included on the site plan, if appropriate; additional site plans may be required to present the locations of relevant off-site well locations, structures, and features;

c. figures showing historical and proposed soil boring locations, excavation locations, and sampling locations;

d. figures presenting historical soil sample field screening and laboratory analytical data;

e. figures presenting the locations of all existing and proposed borings and vapor monitoring point locations,

f. figures presenting historical vadose zone organic vapor data;

g. figures showing all existing and proposed monitoring wells and piezometers;

h. figures presenting historical groundwater and vadose zone fluid elevation data, and indicating groundwater and vadose zone fluid flow directions;

i. figures presenting historical groundwater and vadose zone fluid laboratory analytical data, if applicable; the chemical analytical data corresponding to each sampling location can be presented in tabular form on the figure or as an isoconcentration map;

j. figures presenting historical and proposed vadose zone fluid neutron probe access tube locations and field measurement data for soil moisture, if applicable;

k. figures presenting historical surface water laboratory analytical data, if applicable;

l. figures showing historical and proposed air sampling locations and presenting historical air quality data, if applicable;

m. figures presenting historical pilot testing locations and data, where applicable, including site plans and graphic data presentation; and

n. figures presenting geologic cross-sections based on outcrop and borehole data acquired during previous investigations, if applicable.

2.13 Appendices

An IDW management plan must be included as an appendix to the investigation work plan. Additional appendices may be necessary to present additional data or documentation not listed above.

3. Investigation Report

Permittees must prepare investigation reports at the facility using the general outline below. Investigation Reports are the reporting mechanism for presenting the results of completed Investigation Work Plans. This section describes the minimum requirements for reporting on site investigations. All data collected during each site investigation event in the reporting period must be included in the reports. In general, interpretation of data must be presented only in the background, conclusions, and recommendations sections of the reports. The other text sections of the reports must be reserved for presentation of facts and data without interpretation or qualifications. The general report outline is provided below.

3.1 Title Page

The title page must include the type of document and version number, the facility name, the unit, SWMU, or AOC, and the submittal date. A signature block providing spaces for the name, title, and organization of the preparer and the responsible facility representative must be provided on the title page in accordance with the signature requirements in 40 CFR 270.11(b).

3.2 Executive Summary

The executive summary must provide a brief summary of the purpose, scope, and results of the investigation conducted at the subject site during the reporting period. In addition, this section must include a brief summary of conclusions based on the investigation data collected and recommendations for future investigation, monitoring, remedial action, or site closure.

3.3 Table of Contents

The table of contents must list all text sections, subsections, tables, figures, and appendices or attachments included in the report. The corresponding page numbers for the titles of each section of the report must be included in the table of contents.

3.4 Introduction

The introduction section must include the facility name, unit name and location, and unit status (e.g., active operations, closed, corrective action). General information on the site usage and status must be included in this section. A brief description of the purpose of the investigation, the type of site investigation conducted, and the type of results presented in the report also must be provided in this section.

3.5 Background

The background section must describe relevant background information. This section must briefly summarize historical site uses including the locations of current and former site structures and features. A labeled figure must be included in the document showing the locations of current and former site structures and features. The locations of subsurface features such as pipelines, underground tanks, utility lines, and other subsurface structures must be included in the background summary and labeled on the figure. In addition, this section must include a brief summary of the possible sources of contamination, the history of releases or discharges of contamination, the known extent of contamination, and the results of previous investigations including references to previous reports. The references to previous reports must include page, table, and figure numbers for referenced information. A site plan showing relevant investigation locations and summary data tables must be included in the Figures and Tables sections of the document, respectively.

3.6 Scope of Activities

This section on the scope of activities must briefly describe all activities performed during the investigation event including background information research, implemented health and safety measures that affected or limited the completion of tasks, drilling, test pit or other excavation methods, well construction methods, field data collection, survey data collection, chemical analytical testing, aquifer testing, remediation system pilot testing, and IDW storage or disposal.

3.7 Field Investigation Results

A section must provide a summary of the procedures used and the results of all field investigation activities conducted at the site including, but not limited to, the dates that investigation activities were conducted, the type and purpose of field investigation activities performed, field screening measurements, logging and sampling results, pilot test results, construction details, and conditions observed. Field observations or conditions that altered the planned work or may have influenced the results of sampling, testing, and logging must be reported in this section. At a minimum, the following subsections must be included, where appropriate.

3.7.1 Surface Conditions

A section on surface conditions must describe current site topography, features, and structures including topographic drainages, man-made drainages, vegetation, and erosional features. It must also include a description of current site uses and any operations at the site. In addition, descriptions of features located in surrounding sites that may have an impact on the subject site

regarding sediment transport, surface water runoff, or contaminant transport must be included in this section.

3.7.2 Exploratory Drilling or Excavation Investigations

A section must describe the locations, methods, and depths of subsurface explorations. The description must include the types of equipment used, the logging procedures, exploration equipment, decontamination procedures, and conditions encountered that may have affected or limited the investigation. Samples obtained from all exploratory borings and excavations must be visually inspected and the soil or rock type classified in general accordance with ASTM D2487 (Unified Soil Classification System) and D2488, or AGI Methods for soil and rock classification. Detailed logs of each boring must be completed in the field by a qualified engineer or geologist.

A description of the site conditions observed during subsurface investigation activities must be included in this section, including soil horizon and stratigraphic information. Site plans showing the locations of all borings and excavations must be included in the Figures section of the report. Boring and test pit logs for all exploratory borings and test pits must be presented in an appendix or attachment to the report.

3.7.3 Subsurface Conditions

A section on subsurface conditions must describe known subsurface lithology and structures based on observations made during the current and previous subsurface investigations, including interpretation of geophysical logs and as-built drawings of man-made structures. A description of the known locations of pipelines, utility lines, and observed geologic structures must also be included in this section. A site plan showing boring and excavation locations and the locations of the site's above- and below-ground structures must be included in the Figures section of the report. In addition, cross-sections must be constructed, if appropriate, to provide additional visual presentation of site or regional subsurface conditions.

3.7.4 Monitoring Well Construction, Boring, or Excavation Abandonment

A section must describe the methods and details of monitoring well construction and the methods used to abandon or backfill exploratory borings and excavations. The description must include the dates of well construction, boring abandonment, or excavation backfilling. In addition, boring logs, test pit logs, and well construction diagrams must be included in an attachment or appendix. Well construction diagrams must be included with the associated boring logs for borings that are converted to monitoring wells.

3.7.5 Groundwater Conditions

A section must describe groundwater conditions observed beneath the subject site and relate local groundwater conditions to regional groundwater conditions. A description of the depths to water, aquifer thickness, and groundwater flow directions must be included in this section for alluvial groundwater, shallow perched groundwater, intermediate perched groundwater, and regional groundwater, as appropriate to the investigation. Figures showing well locations,

surrounding area, groundwater elevations, and flow directions for each hydrologic zone must be included in the Figures section of the report.

3.7.6 Surface Water Conditions

A section must describe surface water conditions and include a description of surface water runoff, surface water drainage, surface water sediment transport, and contaminant transport in surface water as suspended load and as a dissolved phase in surface water via natural and man-made drainages, if applicable. A description of contaminant fate and transport must be included, if appropriate.

3.7.7 Subsurface Air and Soil Moisture Conditions

A section must describe subsurface air monitoring and sampling methods used during the site investigation. It must also describe observations made during the site investigation regarding subsurface flow pathways and the subsurface air-flow regime.

3.7.8 Materials Testing Results

A section must discuss the materials testing results, such as core permeability testing, grain size analysis, or other materials testing results. Sample collection methods, locations, and depths must also be included. Corresponding summary tables must be included in the Tables section of the report.

3.7.9 Pilot Testing Results

A section must discuss the results of any pilot testing. Pilot testing is typically conducted after initial subsurface investigations are completed and the need for additional investigation or remediation has been evaluated. Pilot testing, including aquifer testing and remediation system pilot testing, must be addressed through separate pilot test work plans and reports. The format for pilot test work plans and reports must be approved by the NMED prior to submittal.

3.8 Regulatory Criteria

A section must set forth the applicable cleanup standards, screening levels, and risk-based cleanup goals for each pertinent medium at the subject site. The appropriate cleanup levels for each site must be included if site-specific levels have been established at separate facility sites or units. A table summarizing the applicable cleanup standards must be included as part of the document. Alternately, the report may include applicable cleanup standards as a column in the data tables. Risk-based evaluation procedures, if used to calculate cleanup levels, must be presented in a separate document or in an appendix to this report. If cleanup levels calculated in a risk evaluation are employed, the risk evaluation document must be referenced and must include pertinent page numbers for referenced information.

3.9 Site Contamination

A section must provide a description of sampling intervals and methods for detection of surface and subsurface contamination in soils, rock, sediments, groundwater, surface water, and as vapor-phase contamination. Only factual information must be included in this section. Interpretation of the data must be reserved for the summary and conclusions sections of the report. Tables summarizing all sampling, testing, and screening results for detected contaminants must be prepared in a format approved by the NMED. The tables must be presented in the Tables section of the report.

3.9.1 Soil, Rock, and Sediment Sampling

A section must describe the sampling of soil, rock and sediment. It must include the dates, locations, and methods of sample collection, sampling intervals, sample logging methods, screening sample selection methods, and laboratory sample selection methods including the collection depths for samples submitted for laboratory analyses. A site plan showing the sample locations must be included in the Figures section of the report.

3.9.2 Sample Field Screening Results

A section must describe the field screening methods used during the investigation and the field screening results. Field screening results also must be presented in summary tables in the Tables section of the document. The limitations of field screening instrumentation and any conditions that influenced the results of field screening must be discussed in this subsection.

3.9.3 Soil, Rock, and Sediment Sampling Chemical Analytical Results

A section must briefly summarize the laboratory analyses conducted, the analytical methods and results and provide a comparison of the data to cleanup standards or established cleanup levels for the site. The laboratory results also must be presented in summary tables in the Tables section of the document. Field conditions and sample collection methods that could potentially affect the analytical results must be described in this section. If appropriate, soil analytical data must be presented with sample locations on a site plan and included in the Figures section of the report.

3.9.4 Subsurface Vapor Sampling

A section must describe the air and subsurface vapor sampling. It must describe the dates, locations, methods of sample collection, methods for sample logging, and methods for laboratory sample selection. A site plan showing all air and subsurface vapor sampling locations must be provided in the Figures section of the report.

3.9.5 Subsurface Vapor Field Screening Results

A section must describe the subsurface vapor field screening results. It must describe the field screening methods used for ambient air and subsurface vapors during the investigation and the field screening results. Field screening results must also be presented in summary tables in the Tables section of the report. The locations of ambient air and subsurface vapor screening sample

collection must be presented on a site plan included in the Figures section of the report. The limitations of field screening instrumentation and any conditions that influenced the results of field screening must be discussed in this section.

3.9.6 Air and Subsurface Vapor Laboratory Analytical Results

This section must describe the results of air and subsurface vapor laboratory analyses. It must describe the air sampling laboratory analytical methods and results and provide a comparison of the data to applicable cleanup levels for the site. The rationale or purpose for altering or modifying the subsurface vapor sampling program outlined in the site investigation work plan also must be provided in this section. Field conditions that may have affected the analytical results during sample collection must be described in this section. Tables summarizing the air sample laboratory, field, and analytical QA/QC data; applicable cleanup levels; and modifications to the air sampling program must be provided in the Tables section of the report. Contaminant concentrations must be presented as data tables or as isoconcentration contours on a map included in the Figures section of the report.

3.10 Conclusions

A conclusions section must provide a brief summary of the investigation activities and a discussion of the conclusions of the investigation conducted at the site. In addition, this section must provide a comparison of the results to applicable cleanup levels, and to relevant historical investigation results and analytical data. Potential receptors, including groundwater, must be identified and discussed. An explanation must be provided with regard to data gaps. A risk assessment may be included as an appendix to the investigation report; however, the risk analysis must be presented in the risk assessment format described in Permit Section 6.5. References to the risk analysis must be presented only in the summary and conclusions sections of the Investigation Report.

3.11 Recommendations

A section must discuss the need for further investigation, corrective measures, risk assessment and monitoring, or recommendations for corrective action completed based on the conclusions provided in the Conclusions section. It must include explanations regarding additional sampling, monitoring, and site closure. A corresponding schedule for further action regarding the site must also be provided.

3.12 Tables

This section must provide the following summary tables. Data presented in the tables must include the current data, dates of data collection, analytical methods, detection limits, and significant data quality exceptions. All summary data tables must include only detected analytes and data quality exceptions that could potentially mask detections. The following tables must be included in investigation reports, as applicable:

a. tables summarizing regulatory criteria, background levels, and applicable cleanup levels; this information may be included in the analytical data tables instead of as separate tables;

b. tables summarizing field survey location data; separate tables must be prepared for well locations and individual medium sampling locations except where the locations are the same for more than one medium;

c. tables summarizing field screening and field parameter measurements of soil, sediment, vadose zone fluid, vadose zone vapor, vadose zone moisture, and groundwater, surface water, and air quality;

d. a table summarizing soil laboratory analytical data; it must include the analytical methods, detection limits, and significant data quality exceptions that would influence interpretation of the data;

e. a table summarizing the groundwater elevations and depth-to-water data; the table must include the monitoring well depths and the screened intervals in each well;

f. a table summarizing the groundwater laboratory analytical data; the analytical data tables must include the analytical methods, detection limits, and significant data quality exceptions that would influence interpretation of the data;

g. a table summarizing the surface water laboratory analytical data; the analytical data tables must include the analytical methods, detection limits, and significant data quality exceptions that would influence interpretation of the data;

h. A table summarizing the air sample screening and laboratory analytical data; the data tables must include the screening instruments used, laboratory analytical methods, detection limits, and significant data quality exceptions that would influence interpretation of the data;

i. tables summarizing the pilot testing data, if applicable, including units of measurement and types of instruments used to obtain measurements; and

j. a table summarizing the materials testing data, if applicable.

3.13 Figures

All figures must be included with each investigation report, as appropriate. All figures must include a scale and a north arrow. An explanation must be provided on each figure for all abbreviations, symbols, acronyms, and qualifiers. All maps must have a date. A section must provide the following figures:

a. a vicinity map showing topography and the general location of the site relative to surrounding features and properties;

b. a site plan that presents pertinent site features and structures, underground utilities, well locations, and remediation system locations and details; off-site well locations and other relevant features must be included on the site plan; additional site plans may be required to present the locations of relevant off-site well locations, structures and features;

c. figures showing boring, excavation, and sampling locations;

d. figures presenting soil sample field screening and laboratory analytical data;

e. figures displaying the locations of all newly installed and existing wells and borings;

f. figures presenting monitoring well locations, groundwater elevation data, and groundwater flow directions;

g. figures presenting groundwater laboratory analytical data, including any past data requested by the NMED; the chemical analytical data corresponding to each sampling location may be presented in table form on the figure or as an isoconcentration map;

h. figures presenting surface water sample locations and field measurement data including any past data requested by the NMED;

i. figures presenting surface water laboratory analytical data including any past data, if applicable; the laboratory analytical data corresponding to each sampling location may be presented in tabular form on the figure;

j. figures showing air and subsurface vapor sampling locations and presenting air and subsurface vapor quality data; the field screening or laboratory analytical data corresponding to each sampling location may be presented in tabular form on the figure or as an isoconcentration map;

k. figures presenting geologic cross-sections based on outcrop and borehole data; and

l. figures presenting pilot testing locations and data, where applicable, including site plans or graphic data presentation.

3.14 Appendices

Each investigation report must include the following appendices. Additional appendices may be necessary to present data or documentation not listed below.

3.14.1 Field Methods

An appendix must provide detailed descriptions of the methods used to acquire field measurements of each media that was surveyed or tested during the investigation. Methods must include, but are not limited to, exploratory drilling or excavation methods, the methods and types

of instruments used to obtain field screening, field analytical or field parameter measurements, instrument calibration procedures, sampling methods for each medium investigated, decontamination procedures, sample handling procedures, documentation procedures, and a description of field conditions that affected procedural or sample testing results. Methods of measuring and sampling during pilot testing must be reported in this appendix, if applicable. Copies of IDW disposal documentation must be provided in a separate appendix.

3.14.2 Boring/Test Pit Logs and Well Construction Diagrams

An appendix must provide boring logs, test pit or other excavation logs, and well construction details. In addition, a key to symbols and a soil or rock classification system must be included in this appendix. Geophysical logs must be provided in a separate section of this appendix.

3.14.3 Chemical Analytical Program

Chemical analytical methods, a summary of data quality objectives, and a summary of data quality review procedures must be reported in an appendix. A summary of data quality exceptions and their effect on the acceptability of the field and laboratory analytical data with regard to the investigation and the site status must be included in this appendix, along with references to case narratives provided in the laboratory reports.

3.14.4 Chemical Analytical Reports

A section must include all laboratory chemical analytical data generated for the reporting period. The reports must include all chain-of-custody records and QA/QC results provided by the laboratory. The laboratory reports may be provided electronically in a format approved by the NMED and must be in the form of a final laboratory report. Laboratory report data tables may be submitted in Microsoft Excel format. Hard (paper) copies of the chain-of-custody forms must be submitted with the reports regardless of whether the final laboratory report is submitted electronically or in hard copy.

3.14.5 Other Appendices

Other appendices containing additional information must be included as required by the NMED or as otherwise appropriate.

4. Periodic Monitoring Report

The Permittee must use the following guidance for preparing periodic monitoring reports. The reports must present the results of periodic groundwater, surface water, vapor, and remediation system monitoring at the facility. The following sections provide a general outline for monitoring reports and the minimum requirements for reporting of periodic monitoring conducted at the facility. All data collected during each monitoring or sampling event in the reporting period must be included in the reports. In general, interpretation of data must be presented only in the background, conclusions, and recommendations sections of the reports. The other text sections of the reports must be reserved for presentation of facts and data without interpretation or qualifications.

4.1 Title Page

The title page must include the type of document, revision number if applicable, the facility name, the unit, SWMU, or AOC name(s), and the submittal date. A signature block providing spaces for the name, title, and organization of the preparer and the responsible representative of the facility must be provided on the title page in accordance with the signature requirements in 40 CFR 270.11(b).

4.2 Executive Summary

The executive summary must provide a brief summary of the purpose, scope, and results of the monitoring conducted at the subject site during the reporting period. The facility, unit, SWMU, and AOC name(s) and location(s) must be included in the executive summary. In addition, this section must include a brief summary of conclusions based on the monitoring data collected.

4.3 Table of Contents

The table of contents must list all text sections, subsections, tables, figures, and appendices or attachments included in the report. The corresponding page numbers for the titles of each section of the report must be included in the table of contents.

4.4 Introduction

The introduction section must include the facility name and the unit name(s), location(s), and status (e.g. active operations, closed, corrective action). General information on the site usage and status must be included in this section. A brief description of the purpose of the monitoring, type of monitoring conducted, and the type of results presented in the report also must be provided in this section.

4.5 Scope of Activities

A section on the scope of activities must briefly describe all activities performed during the monitoring event or reporting period including field data collection, analytical testing, if applicable, and purge/decontamination water storage and disposal.

4.6 Regulatory Criteria

A section on regulatory criteria must provide information regarding applicable cleanup standards, risk-based screening levels, and risk-based cleanup goals for the site. A table summarizing the applicable cleanup standards, or inclusion of applicable cleanup standards as a column in the data tables, can be substituted for this section. The appropriate cleanup levels for each site must be included if site-specific levels have been established at separate sites. Risk-based evaluation procedures, if used to calculate cleanup levels, must either be included as an attachment or submitted as a separate document and referenced. The specific document and page numbers must be included for all referenced materials.

4.7 Monitoring Results

A section must provide a summary of the results of monitoring conducted at the site. This section must include the dates and times that monitoring was conducted, the measured depths to groundwater, directions of groundwater and vadose zone fluids flow, field air and water quality measurements, static pressures, field measurements, and a comparison to previous monitoring results. Field observations or conditions that may influence the results of monitoring must be reported in this section. Tables summarizing leachate and vapor-monitoring parameters, groundwater and vadose zone fluid elevations, depth-to-water measurements, and other field measurements may be substituted for this section. The tables must include all information required in Permit Section 6.4.11.

4.8 Chemical Analytical Data Results

A section must discuss the results of the chemical analyses. It must provide the dates of sampling and the analytical results. It must also provide a comparison of the data to previous results and to any cleanup standards or established cleanup levels for the site. The rationale or purpose for altering or modifying the sampling program must be provided in this section. A table summarizing the laboratory analytical data, QA/QC data, applicable cleanup levels, and modifications to the sampling program may be substituted for this section. The tables must include all information required in Permit Section 6.4.11.

4.9 Remediation System Monitoring

A section must discuss remediation system monitoring. It must summarize the remediation system's capabilities and performance. It must also provide monitoring data, treatment system discharge sampling requirements, and system influent and effluent sample analytical results. The dates of operation, system failures, and modifications made to the remediation system during the reporting period must also be included in this section. A summary table may be substituted for this section. The tables must include all information required in Permit Section 6.4.11.

4.10 Summary

A summary section must provide a discussion and conclusions of the monitoring conducted at the site. In addition, this section must provide a comparison of the results to applicable cleanup levels and to relevant historical monitoring and chemical analytical data. An explanation must be provided with regard to data gaps. A discussion of remediation system performance, monitoring results, modifications if applicable, and compliance with discharge requirements must be provided in this section. Recommendations and explanations regarding future monitoring, remedial actions, or site closure must also be included in this section.

4.11 Tables

A section must provide the following summary tables for the media sampled. With prior approval from the NMED, the Permittee may combine one or more of the tables. Data presented in the tables must include the current sampling and monitoring data, as well as data from the three previous monitoring events or, if data from less than three monitoring events is available, data

acquired during previous investigations. Remediation system monitoring data also must be presented. The dates of data collection must be included in the tables. Summary tables may be substituted for portions of the text. The analytical data tables must include only detected analytes and data quality exceptions that could potentially mask detections. The following tables must be included, as applicable:

a. a table summarizing the regulatory criteria (a regulatory criteria text section may be substituted for this table or the applicable cleanup levels may be included in the analytical data tables);

b. a table summarizing groundwater and vadose zone fluid elevations, and depths to water data; the table must include the monitoring well depths, casing elevations, the screened intervals in each well, and the dates and times of measurements;

c. a table summarizing field measurements of surface water quality data, if applicable;

d. a table summarizing field measurements of subsurface vapor monitoring and soil moisture data (including historical vapor monitoring data as described above);

e. a table summarizing field measurements of groundwater and vadose zone fluid quality data (including historical water quality data as described above);

f. a table summarizing subsurface vapors chemical analytical data, if applicable (including historical analytical data as described above);

g. a table summarizing surface water chemical analytical data, if applicable (including historical surface water analytical data as described above);

h. a table summarizing groundwater and vadose zone fluid chemical analytical data (including historical groundwater analytical data as described above); and

i. a table summarizing remediation system monitoring data, if applicable (including historical remediation system monitoring data as described above).

4.12 Figures

A section must include the following figures. All figures must include a scale and north arrow. An explanation must be provided on each figure for all abbreviations, symbols, acronyms, and qualifiers. All figures must have a date. The following figures must be included, as applicable:

a. a vicinity map showing topography and the general location of the site relative to surrounding features or properties;

b. a facility site plan that presents pertinent site features and structures, well and piezometer

neutron probe access tubes locations and remediation system location(s) and features; off-site well locations and pertinent features must be included on the site plan, if practical; additional site plans may be required to present the locations of relevant off-site well locations, structures, and features;

c. figures presenting the locations of neutron probe access tubes, monitoring and other well locations, groundwater and vadose zone fluid elevation data, and groundwater and vadose zone fluid flow directions;

d. figures presenting groundwater and vadose zone fluid analytical data for the current monitoring event; the analytical data corresponding to each sampling location may be presented in tabular form on the figure or as an isoconcentration map;

e. figures presenting surface water sampling locations and analytical data for the current monitoring period;

f. figures presenting vertical profiles of soil moisture content for neutron probe measurements for the current monitoring period;

g. figures presenting subsurface vapor sampling locations and analytical data for the current monitoring event; the analytical data corresponding to each sampling location may be presented in table form on the figure or as an isoconcentration map; and

h. figures presenting geologic cross-sections based on outcrop and borehole data, if applicable.

4.13 Appendices

Each monitoring report must include the following appendices. Additional appendices may be necessary to present data or documentation not listed below.

4.13.1 Field Methods

The report must include a section that outlines the methods used to acquire field measurements of groundwater and vadose zone fluid elevations, subsurface vapor, soil moisture, water quality data, subsurface vapor samples, vadose zone fluid samples, and groundwater samples. It must include the methods and types of instruments used to measure depths to water, air, headspace, or subsurface vapor parameters, soil moisture information, and water quality parameters. In addition, decontamination, well purging techniques, well sampling techniques, and sample handling procedures must be provided in this appendix. Methods of measuring and sampling remediation systems must be reported in this section, if applicable. Purge and decontamination water storage and disposal methods must also be presented in this appendix. Copies of purge and decontamination water disposal documentation must be provided in a separate appendix.

4.13.2 Chemical Analytical Program

An appendix must discuss the analytical program. It must include the analytical methods, a summary of data quality objectives, and data quality review procedures. A summary of data quality exceptions and their effect on the acceptability of the analytical data with regard to the monitoring event and the site status must be included in this appendix along with references to case narratives provided in the laboratory reports.

4.13.3 Chemical Analytical Reports

An appendix must include all laboratory chemical analytical data generated for the reporting period. The data may be submitted electronically on a compact disc in Microsoft Excel or other format acceptable to the NMED. The reports must include all chain-of-custody records and QA/QC results provided by the laboratory. Hard (paper) copies of all chain-of-custody records must be submitted as part of this appendix.

5. Risk Assessment Report

The Permittee must prepare risk assessment reports for sites requiring corrective action at the facility using the format described below. This section provides a general outline for risk assessments and also sets forth the minimum requirements for describing risk assessment elements. In general, interpretation of data must be presented only in the background, conceptual site model, and conclusions and recommendations sections of the reports. The other text sections of the risk assessment report must be reserved for presentation of sampling results from all investigations, conceptual and mathematical elements of the risk assessment, and presentations of toxicity information and screening values used in the risk assessment. The human health and ecological risk assessments must be presented in separate sections, but the general risk assessment outline applicable to both sections is provided below.

5.1 Title Page

The title page must include the type of document, revision number if applicable, the facility name, the unit, SWMU, or AOC name(s), and the submittal date. A signature block providing spaces for the name, title, and organization of the preparer and the responsible representative of the facility must be provided on the title page in accordance with the signature requirements in 40 CFR 270.11(b).

5.2 Executive Summary

The executive summary section must provide a brief summary of the purpose and scope of the risk assessment of the subject site. The executive summary must also briefly summarize the conclusions of the risk assessment. The facility, unit, SWMU, or AOC name(s) and location(s) must be included in the executive summary.

5.3 Table of Contents

The table of contents must list all text sections, subsections, tables, figures, and appendices or attachments included in the risk assessment. The corresponding page numbers for the titles of each unit of the report must be included in the table of contents.

5.4 Introduction

The introduction section must include the facility name, unit name(s) and location(s), and unit status (e.g., active operations, closed, corrective action). General information on the current site usage and status must be included in this section.

5.5 Background

The background section must describe relevant background information. This section must briefly summarize historical site uses including the locations of current and former site structures and features. A labeled figure must be included in the document showing the locations of current and former site structures and features.

5.5.1 Site Description

A section must provide a description of current site topography, features, and structures including a description of drainages, erosional features, current site uses, and other data relevant to assessing risk at the site. Depth to groundwater, vadose zone fluids, and directions of groundwater and vadose zone fluids flow must be included in this section. The presence and location of surface water bodies such as springs or wetlands must be noted in this section. Photos of the site may be incorporated into this section, if desired. Ecological features of the site must be described here, including type and amount of vegetative cover, observed and expected wildlife receptors, and level of disturbance of the site. A topographical map of the site and general vicinity of the site showing habitat types, boundaries of each habitat, and any surface water features must be included in the Figures section of the document.

5.5.2 Sampling Results

A section must include a summary of the history of releases of contaminants, known and possible sources of contamination, and the vertical and lateral extent of contamination present in each media. This section must include summaries of sampling results of all investigations, including site plans (included in the Figures section of the document), showing locations of detected contaminants. This section must reference pertinent figures, data summary tables, and citations for references to previous reports. References to previous reports must include page, table, and figure numbers for referenced information. Summaries of sampling data for each constituent must include the maximum value detected, the detection limit, the 95% UCL of the mean value detected (if applicable to the data set) and whether that 95% UCL of the mean was calculated based on a normal or lognormal distribution. Background values used for comparison to inorganic constituents at the site must be presented in this subsection. The table of background values must appear in the Tables section of the document and include actual values used as well as the origin

of the values (facility-wide, site-specific, UCL, UTL). This section must also include a discussion of how “non-detect” sample results were handled in the averaging of data.

5.6 Conceptual Site Model

A section must present the conceptual site model. It must include information on the expected fate and transport of contaminants detected at the site. This section must provide a list of all sources of contamination at the site. Sources that are no longer considered to be ongoing but represent the point of origination for contaminants transported to other locations must be included. The discussion of fate and transport must address potential migration of each contaminant in each medium, potential breakdown products and their migration, and anticipated pathways of exposure for human or ecological receptors. Diagrammatic representations of the conceptual site model must appear in the Figures section of the document.

For human health risk assessments, the conceptual site model must include residential land use as the future land use for all risk assessments. In addition, site-specific future land use may be included, provided that written approval to consider a site-specific future land use has been obtained from the NMED prior to inclusion in the risk assessment. If a site-specific future land use scenario appears in the risk assessment, all values for exposure parameters and the source of those values must be included in table format and presented in the Tables section of the document.

Conceptual site models presented for ecological risk assessments must identify assessment endpoints and measurement receptors for the site. The discussion of the model must explain how the measurement receptors for the site are protective of wildlife receptors.

5.7 Risk Screening Levels

A section must present the actual screening values used for each contaminant for comparison to all human health and ecological risk screening levels. A discussion of the methods used to calculate the screening levels in accordance with Permit Section 3.5 and any variances from those procedures must be included in this Section. If no valid toxicological studies exist for the receptor or contaminant, the contaminant and receptor combination must be addressed using qualitative methods. If an approved site-specific risk scenario is used for the human health risk assessment, this section must include all toxicity information and exposure assessment equations used for the site-specific scenario, as well as the sources for that information. Other regulatory levels applicable to screening the site, such as drinking water MCLs, must also be included in this section.

5.8 Risk Assessment Results

This section must present all risk values, Hazard Quotients (HQs), and Hazard Indices (HIs) for human health under projected future residential scenario and any site-specific scenarios. This section must also present the HQ and HI for each contaminant for each ecological receptor. IN

addition, this section must include discussion of qualitative, semi-quantitative, and quantitative uncertainty in the risk assessment and estimate the potential impact of the various uncertainties.

5.9 Conclusions and Recommendations

This section must include an interpretation of the results of the risk assessment and any recommendations for future disposition of the site. This section may include additional information and considerations that the Permittee believes are relevant to the analysis of the site.

5.10 Tables

Data presented in the summary tables must include information on detection limits and significant data quality exceptions. All data tables must include only detected analytes and data quality exceptions that could potentially mask detections. A section must provide the following summary tables, as appropriate. With prior approval from the NMED, the Permittee may combine one or more of the tables:

a. a table presenting background values used for comparison to inorganic constituents at the site; the table must include actual values used as well as the origin of the values (facility-wide, site-specific, UCL, UTL, or maximum);

b. a table summarizing sampling data must include, for each constituent, all detected values above background, the maximum value detected, the 95 percent UCL of the mean value detected (if applicable to the data set), and whether that 95 percent UCL of the mean was calculated based on a normal or lognormal distribution;

c. a table of all screening values used and the sources of those values;

d. a table presenting all risk values, HQs, and HIs under projected future residential scenario;

e. a table presenting all risk values, HQs, and HIs under approved additional site- specific future land use scenario; and

f. a table presenting the HQ and HI for each contaminant for each ecological receptor.

5.11 Figures

This section must present the following figures for each site, as appropriate. With prior approval from the NMED, the Permittee may combine one or more of the figures. All figures must include a scale and a north arrow. An explanation must be provided on each figure for all abbreviations, symbols, acronyms, and qualifiers. The following figures must be included, as applicable:

a. a vicinity map showing topography and the general location of the site relative to surrounding features or properties;

b. for human health risk assessments, a site plan that presents pertinent site features and structures, underground utilities, well locations, and remediation system locations and its details; off-site well locations and other relevant features must be included on the site plan if practical; additional site plans may be required to present the locations of relevant off-site wells, structures, and features;

c. for ecological risk assessments, a topographical map of the site and general vicinity of the site showing habitat types, boundaries of each habitat, and any surface water features; and

d. conceptual site model diagrams for both human health and ecological risk assessments.

5.12 Appendices

Appendices may be included to present additional relevant information for the risk analysis such as the results of statistical analyses of data sets and comparisons of data, ecological checklists for the site, full sets of results of all sampling investigations at the site, or other data as appropriate.

6. Corrective Measures Evaluation

The Permittee must prepare corrective measures evaluations for sites requiring corrective measures using the format described below. This section provides a general outline for corrective measures evaluations and sets forth the minimum requirements for describing corrective measures when preparing these documents. All investigation summaries, site condition descriptions, corrective action goals, corrective action options, remedial options selection criteria, and schedules must be included in the corrective measures evaluations. In general, interpretation of historical investigation data must be presented only in the background sections of the corrective measures evaluations. At a minimum, detections of contaminants encountered during previous site investigations must be presented in the corrective measures evaluations in table format with an accompanying site plan depicting sample locations. The other text sections of the corrective measures evaluations must be reserved for presentation of corrective action-related information regarding anticipated or potential site-specific corrective action options and methods relevant to the project. The general corrective measures evaluation outline is provided below.

6.1 Title Page

The title page must include the type of document, revision number if applicable, the facility name, the unit, SWMU, or AOC name(s), and the submittal date. A signature block providing spaces for the name, title, and organization of the preparer and the responsible facility representative must be provided on the title page in accordance with the signature requirements in 40 CFR 270.11(b).

6.2 Executive Summary

The executive summary must provide a brief summary of the purpose and scope of the corrective measures evaluation to be conducted at the site. The executive summary or abstract must also

briefly summarize the conclusions of the evaluation. The facility, unit, SWMU, or AOC name(s) and location(s) must be included in the executive summary.

6.3 Table of Contents

The table of contents must list all text sections, subsections, tables, figures, and appendices or attachments included in the corrective measures evaluation. The corresponding page numbers for the titles of each section of the report must be included in the table of contents.

6.4 Introduction

The introduction section must include the facility name, unit name(s) and location(s) and unit status (e.g., active operations, closed, corrective action). General information on the current site use and status must be included in this section. A brief description of the purpose of the corrective measures evaluation and the corrective action objectives for the project also must be provided in this section.

6.5 Background

The background section must describe the relevant background information. This section must briefly summarize historical site activities including the locations of current and former site structures and features. A labeled figure must be included in the document showing the locations of current and former site structures and features. The locations of subsurface features such as pipelines, underground tanks, utility lines, and other subsurface structures must be included in the background section and labeled on the site plan.

This section must include contaminant and waste characteristics, a brief summary of the history of contaminant releases, known and possible sources of contamination, and the vertical and lateral extent of contamination present in each medium. This section must include brief summaries of results of previous investigations, including references to pertinent figures, data summary tables, and text in previous reports. References to previous reports must include page, table, and figure numbers for referenced information. Summary tables and site plans showing relevant investigation locations must be referenced and included in the Tables and Figures sections of the document, respectively.

6.6 Site Conditions

6.6.1 Surface Conditions

A section on surface conditions must describe current and historic site topography, features, and structures, including a description of topographic drainages, man-made drainages, vegetation, and erosional features. It must also include a description of current uses of the site and any current operations at the site. This section must also include a description of those features that could potentially influence corrective action option selection or implementation such as archeological sites, wetlands, or other features that may affect remedial activities. In addition, descriptions of features located in surrounding sites that may have an effect on the subject site regarding sediment transport, surface water runoff, or contaminant transport must be included in

this section. A site plan displaying the locations of all pertinent surface features and structures must be included in the Figures section of the corrective measures evaluation.

6.6.2 Subsurface Conditions

A section on subsurface conditions must describe the site conditions observed during previous subsurface investigations. It must include relevant soil horizon and stratigraphic information, groundwater and vadose zone fluid conditions, fracture data, and subsurface vapor information. A site plan displaying the locations of all borings and excavations advanced during previous investigations must be included in the Figures section of the corrective measures evaluation.

6.7 Potential Receptors

6.7.1 Sources

A section must provide a list of all sources of contamination at the site where corrective measures are to be considered or are required. Sources that are no longer considered to be releasing contaminants at the site, but may be the point of origination for contaminants transported to other locations, must be included in this section.

6.7.2 Pathways

A section must describe potential migration pathways that could result in either acute or chronic exposures to contaminants. It must include such pathways as utility trenches, paleochannels, surface exposures, surface drainages, stratigraphic units, fractures, structures, and other features. The migration pathways for each contaminant and each medium must be tied to the potential receptors for each pathway. A discussion of contaminant characteristics relating to fate and transport of contaminants through each pathway must also be included in this section.

6.7.3 Receptors

A section must provide a listing and description of all anticipated potential receptors that could possibly be affected by the contamination present at the site. Potential receptors must include human and ecological receptors, groundwater, and other potential receptors. This section must identify relevant pathways, such as pathways that could divert or accelerate the transport of contamination to human receptors, ecological receptors, and/or groundwater.

6.8 Regulatory Criteria

A section must set forth the applicable cleanup standards, risk-based screening levels, and risk-based cleanup goals for each medium at the site. The appropriate cleanup levels for each site must be included, if site-specific levels have been established. A table summarizing the applicable cleanup standards must be included as part of the document. Alternately, the report may include applicable cleanup standards as a column in the data tables. If cleanup levels calculated in a risk evaluation are employed, the risk evaluation document must be referenced including pertinent page numbers for referenced information.

6.9 Identification of Corrective Measures Options

A section must identify and describe potential corrective measures for source, pathway, and receptor controls. Corrective measures options must include the range of available options including, but not limited to, a no action alternative, institutional controls, engineering controls, in-situ and onsite remediation alternatives, complete removal, and any combination of alternatives that would potentially achieve cleanup goals.

6.10 Evaluation of Corrective Measures Options

A section must provide an evaluation of the corrective measures options identified in Section 6.6.9 above. The evaluation must be based on the applicability, technical feasibility, effectiveness, implementability, impacts to human health and the environment, and cost of each option. A table summarizing the corrective measures alternatives and the criteria listed below must be included in the Tables section of this document. The general basis for evaluation of corrective measures options is described below.

6.10.1 Applicability

Applicability addresses the overall suitability for the corrective action option for containment or remediation of the contaminants in the relevant media with regard to protection of human health and the environment.

6.10.2 Technical Feasibility

Technical feasibility describes the uncertainty in designing, constructing, and operating a specific remedial alternative. The description must include an evaluation of historical applications of the remedial alternative including performance, reliability, and minimization of hazards.

6.10.3 Effectiveness

Effectiveness assesses the ability of the corrective measure to mitigate the measured or potential impact of contamination in a medium under the current and projected site conditions. The assessment also must include the anticipated duration for the technology to attain regulatory compliance. In general, all corrective measures described above will have the ability to mitigate the impacts of contamination at the site, but not all remedial options will be equally effective at achieving the desired cleanup goals to the degree and within the same time frame as other options. Each remedy must be evaluated for both short-term and long-term effectiveness.

6.10.4 Implementability

Implementability characterizes the degree of difficulty involved during the installation, construction, and operation of the corrective measure. Operation and maintenance of the alternative must be addressed in this section.

6.10.5 Human Health and Ecological Protectiveness

This category evaluates the short-term (remedy installation-related) and long-term (remedy operation-related) hazards to human health and the environment of implementing the corrective measure. The assessment must include whether the technology will create a hazard or increase existing hazards and the possible methods of hazard reduction.

6.10.6 Cost

A section must discuss the anticipated cost of implementing the corrective measure. The costs must be divided into: 1) capital costs associated with construction, installation, pilot testing, evaluation, permitting, and reporting of the effectiveness of the alternative; and 2) continuing costs associated with operating, maintaining, monitoring, testing, and reporting on the use and effectiveness of the technology.

6.11 Selection of Preferred Corrective Measure

The Permittee must propose the preferred corrective measures at the site and provide a justification for the selection in this section. The proposal must be based upon the ability of the remedial alternative to: 1) achieve cleanup standard objectives in a timely manner; 2) protect human and ecological receptors; 3) control or eliminate the sources of contamination; 4) control migration of released contaminants; and 5) manage remediation waste in accordance with State and Federal regulations. The justification must include the supporting rationale for the remedy selection, based on the factors listed in Permit Section 6.6.10, and a discussion of short- and long-term objectives for the site. The benefits and possible hazards of each potential corrective measure alternative must be included in this section.

6.12 Design Criteria to Meet Cleanup Objectives

The Permittee must present descriptions of the preliminary design for the selected corrective measures in this section. The description must include appropriate preliminary plans and specifications to effectively illustrate the technology and the anticipated implementation of the remedial option at the site. The preliminary design must discuss the design life of the alternative and provide engineering calculations for proposed remediation systems.

6.13 Schedule

A section must set forth a proposed schedule for completion of remedy-related activities such as bench testing, pilot testing, construction, installation, remedial excavation, cap construction, installation of monitoring points, and other remedial actions. The anticipated duration of corrective action operations and the schedule for conducting monitoring and sampling activities must also be presented. In addition, this section must provide a schedule for submittal of reports and data to the NMED, including a schedule for submitting all status reports and preliminary data.

6.14 Tables

A section must present the following summary tables, as appropriate. Data presented in the summary tables must include information on dates of sample collection, analytical methods, detection limits, and significant data quality exceptions. All data tables must include only detected analytes and data quality exceptions that could potentially mask detections. The following summary tables must be included in the corrective measures evaluations, as appropriate:

a. a table summarizing regulatory criteria, background, and the applicable cleanup standards;

b. a table summarizing historical field survey location data;

c. tables summarizing historical field screening and field parameter measurements for each media;

d. tables summarizing historical soil, rock, or sediment laboratory analytical data; the summary tables must include the analytical methods, detection limits, and significant data quality exceptions that would influence interpretation of the data;

e. a table summarizing historical groundwater elevation and depth to water data; the table must include the monitoring well depths and the screened intervals in each well;

f. tables summarizing historical groundwater and vadose zone laboratory analytical data; the analytical data tables must include the analytical methods, detection limits, and significant data quality exceptions that would influence interpretation of the data;

g. tables summarizing historical surface water laboratory analytical data; the analytical data tables must include the analytical methods, detection limits, and significant data quality exceptions that would influence interpretation of the data;

h. tables summarizing historical air sample screening and analytical data; the data tables must include the screening instruments used, laboratory analytical methods, detection limits, and significant data quality exceptions that would influence interpretation of the data;

i. tables summarizing historical pilot or other testing data, if applicable, including units of measurement and types of instruments used to obtain measurements;

j. a table summarizing the corrective measures alternatives and evaluation criteria; and

k. a table presenting the schedule for installation, construction, implementation, and reporting of selected corrective measures.

6.15 Figures

This section must present the following figures for each site, as appropriate. All figures must include a scale. All plan view figures must include a north arrow. An explanation must be provided on each figure for all abbreviations, symbols, acronyms, and qualifiers. All figures must contain a date. The following figures must be included, as applicable:

a. a vicinity map showing topography and the general location of the subject site relative to surrounding features or properties;

b. a unit site plan that presents pertinent site features and structures, underground utilities, well locations, and remediation system locations and details; off-site well locations and other relevant features must be included on the site plan if practical; additional site plans may be required to present the locations of relevant off-site well locations, structures, and features;

c. figures showing historical soil boring locations, excavation locations, and sampling locations;

d. figures presenting historical soil sample field screening and laboratory analytical data, if appropriate;

e. figures showing all existing wells including vapor monitoring wells and piezometers; the figures must present historical groundwater elevation data and indicate groundwater flow directions;

f. figures presenting historical groundwater laboratory analytical data including past data, if applicable; the analytical data corresponding to each sampling location may be presented as individual concentrations, in table form on the figure, or as an isoconcentration map;

g. figures presenting historical surface water sample locations and analytical data including past data, if applicable; the laboratory analytical data corresponding to each sampling location may be presented as individual concentrations or in table form on the figure;

h. figures presenting historical air sampling locations and presenting air quality data; the field screening or laboratory analytical data corresponding to each sampling location may be presented as individual concentrations, in table form on the figure or as an isoconcentration map;

i. figures presenting historical pilot or other test locations and data, where applicable, including site plans or graphic data presentation;

j. figures presenting geologic cross-sections based on outcrop and borehole data, if applicable;

k. figures presenting the locations of existing and proposed remediation systems;

l. figures presenting existing remedial system design and construction details; and

m. figures presenting preliminary design and construction details for preferred corrective measures.

6.16 Appendices

Each corrective measures evaluation must include, as appropriate, as an appendix, the management plan for waste, including investigation derived waste, generated as a result of construction, installation, or operation of remedial systems or activities conducted. Each corrective measures evaluation must include additional appendices presenting relevant additional data, such as pilot or other test or investigation data, remediation system design specifications, system performance data, or cost analyses as necessary.

DEPARTMENT OF THE AIR FORCE

Santa Fe NM 87505-6303

Dear Mr. Pierard

On September, 25th 2020 the New Mexico Environment Department Hazardous Waste Bureau (NMED-HWB) issued an approval with modifications for the Phase I Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) Report, requiring submittal of a work plan for the Phase II RFI Report by April 30, 2021. Kirtland AFB respectfully requests an indefinite extension to the Phase II RFI Work Plan for the Bulk Fuels Facility release site (Solid Waste Management Units ST-106 and SS-111) until a mutual agreement is reached on the technical path forward.

Kirtland AFB appreciates the valued working relationship with you and your department. If you have any questions regarding this request, please contact Mr. Sheen Kottkamp at (806) 463-0811 or email sheen.kottkamp.l@us.af.mil.

Sincerely

DAVID S. MILLER, Colonel, USAF
Commander

RE: APPROVAL – EXTENSION REQUEST
2021 QUARTERLY MONTORING REPORTS
BULK FUELS FACILITY SOLID WASTE MANAGEMENT UNITS ST-106 AND SS-111
KIRTLAND AIR FORCE BASE, NEW MEXICO
EPA ID# NM6213820974
KAFB-BFFS-21-002

Dear Colonel Miller and Lt. Colonel Acosta:

The New Mexico Environment Department (NMED) received the Kirtland Air Force Base (Permittee) letter requesting an extension of time for submittal of the 2021 Quarterly Monitoring Reports, dated May 6, 2021. The reports are currently due 90-days after the end of the quarter. The Permittee requests an extension to allow for sufficient time to thoroughly review the Reports and for the contractor to make necessary revisions.

The Permittee is advised to reference NMED's September 2, 2020 *Requirements for All Document Submittals* for document quality review prior to submittal to NMED.

Col. Miller and Lt. Col. Acosta
May 20, 2021
Page 2 of 2

NMED hereby approves the Air Force's request for an extension; the Permittee must submit the 2021 quarterly reports, as follows:

- First Quarter 2021 Monitoring Report - **August 14, 2021**, as requested.
- Second Quarter 2021 Monitoring Report - **November 30, 2021**, as requested.
- Third Quarter 2021 Monitoring Report - **February 14, 2022**, as requested.
- Fourth Quarter 2021 and Annual 2021 Monitoring Report - **May 31, 2022**, as requested.

If you have any questions, please contact me at (505) 629-6494.

Sincerely,

Kevin Pierard

DEPARTMENT OF THE AIR FORCE
377TH AIR BASE WING (AFGSC)

6 May 2021

Colonel David S. Miller, USAF
Commander
377th Air Base Wing
2000 Wyoming Blvd SE
Kirtland AFB NM 87117

Mr. Kevin M. Pierard
Hazardous Waste Bureau (HWB) Chief
New Mexico Environment Department (NMED)
2905 Rodeo Park Drive East Building 1
Santa Fe NM 87505-6303

Dear Mr. Pierard

Kirtland Air Force Base (AFB) respectfully requests an extension for the submittal of the Bulk Fuels Facility Solid Waste Management Units (SWMUs) ST-106/SS-111 Quarterly Monitoring Reports. Currently the quarterly monitoring reports are submitted to the New Mexico Environmental Department Hazardous Waste Bureau (NMED-HWB) 90 days after the end of the quarter, in accordance with the *Bulk Fuels Facility Expansion of the Dissolved-Phase Plume Groundwater Treatment System Design, Revision 2 SWMUs St-106/SS-111 Kirtland Air Force Base, New Mexico*, which was conditionally approved by NMED-HWB on May 31st 2017. The current reporting schedule does not allow sufficient time for a thorough review by the Air Force and for the contractor to make any necessary revisions. We believe this additional time will result in improved document quality.

The Air Force respectfully requests a 45-day extension on the first quarter (Q1) and third quarter (Q3) Monitoring Reports and a 60-day extension on the second quarter (Q2) and fourth quarter (Q4) Monitoring Reports. These extensions would allow the Air Force sufficient time to produce a document with a higher level of quality and ensure that NMED-HWB's concerns expressed in the July 11, 2020 letter, RE: *Quarterly Monitoring Report For April-June 2019 Bulk Fuels Facility SWMUs St-106/SS-111 Kirtland Air Force Base, New Mexico*, are routinely incorporated into future monitoring reports. In addition, the Air Force is experiencing staff turnover with our legal reviewer and losing the highly qualified expert position. The new legal staff will require additional time for reviews as they become more familiar with the project and the loss of the highly qualified expert will require additional time for all reviewers to ensure the highest level of report quality.

The Q2 and Q4 monitoring reports contain a larger data set because soil vapor and certain groundwater wells are sampled semi-annual. The reports also include a modeling component of groundwater plumes and the Q4 report contains an annual update that evaluates data collected during the previous four quarters. The 60-day extension will allow sufficient time to include these additional elements within the Q2 and Q4 monitoring report.

Upon NMED-HWB approval of the proposed extension, the Q1 and Q3 Monitoring Reports would be submitted no later than August 14th and February 14th, respectively. The Q2 and Q4 Monitoring Reports would be submitted no later than November 30th and May 31st, respectively. Kirtland AFB appreciates

your department's consideration of this extension request. If you have any questions regarding this request, please contact Mr. Sheen Kottkamp at (806)463-0811 or email sheen.kottkamp.1@us.af.mil.

Sincerely

NMED hereby approves the Air Force's request for an extension; the Permittee must submit the 2021 quarterly reports, as follows:

- First Quarter 2021 Monitoring Report - **August 14, 2021**, as requested.
- Second Quarter 2021 Monitoring Report - **November 30, 2021**, as requested.
- Third Quarter 2021 Monitoring Report - **February 14, 2022**, as requested.
- Fourth Quarter 2021 and Annual 2021 Monitoring Report - **May 31, 2022**, as requested.

If you have any questions, please contact me at (505) 629-6494.

Sincerely,

Kevin Pierard

DEPARTMENT OF THE AIR FORCE
377TH AIR BASE WING (AFGSC)

6 May 2021

Colonel David S. Miller, USAF
Commander
377th Air Base Wing
2000 Wyoming Blvd SE
Kirtland AFB NM 87117

Mr. Kevin M. Pierard
Hazardous Waste Bureau (HWB) Chief
New Mexico Environment Department (NMED)
2905 Rodeo Park Drive East Building 1
Santa Fe NM 87505-6303

Dear Mr. Pierard

Kirtland Air Force Base (AFB) respectfully requests an additional 120-day extension for the submittal of the Data Gap Monitoring Well Investigation Report, Bulk Fuels Facility Solid Waste Management Units (SWMUs) ST-106/SS-111. Currently, this investigation report is to be submitted to the New Mexico Environmental Department Hazardous Waste Bureau (NMED-HWB) by June 15, 2021 in accordance with the *Approval with Modifications Work Plan for Data Gap Monitoring Well Installation KAFB-106248 to KAFB-106252 Bulk Fuels Facility 2 SWMUs St-106/SS-111 Kirtland Air Force Base, New Mexico*, sent by NMED-HWB on July 14th, 2020.

The Air Force experienced delays during the field work activities associated with this investigation report. Weather conditions caused delays in the initial mobilization of the drilling equipment and resulted in multiple stand downs due to high wind creating unsafe conditions for the towered drill rig. In addition, the alternating dense clays and gravels caused delays related to equipment maintenance and one boring was abandoned and replaced due to drilling equipment failure. This extension will allow the Air Force sufficient time to produce a quality investigation report.

Upon NMED-HWB approval of the proposed extension, the Data Gap Monitoring Well Investigation Report would be submitted no later than October 13th 2021. Kirtland AFB appreciates the department's consideration of this extension request. If you have any questions regarding this request, please contact Mr. Sheen Kottkamp at (806)463-0811 or email sheen.kottkamp.1@us.af.mil.

Sincerely

RE: APPROVAL – REQUEST FOR EXTENSION TO SUBMIT THE DATA GAP MONITORING WELL INSTALLATION-INVESTIGATION REPORT FOR WELLS KAFB-106248 to KAFB-106252
BULK FUELS FACILITY SOLID WASTE MANAGEMENT UNITS ST-106 AND SS-111
KIRTLAND AIR FORCE BASE, NEW MEXICO
EPA ID# NM6213820974
HWB-KAFB-19-015

Dear Colonel Miller and Lt. Colonel Acosta:

The New Mexico Environment Department (NMED) received the Kirtland Air Force Base (Permittee) letter requesting an extension of time to submit the *Data Gap Monitoring Well Installation-Investigation Report for wells KAFB-106248 to KAFB-106252* (Report), dated May 6, 2021. The Report iss required by the July 9, 2020 Approval with Modifications for the *Work Plan for Data Gap Monitoring Well Installation KAFB-106248 to KAFB-106252*. The Permittee requests an extension of time for submittal of the Report due to delays in completing field work due to inclement weather, drilling equipment failure, and equipment maintenance. NMED hereby approves the Permittee's request for an extension; the Report must be submitted to NMED for review no later than **October 12, 2021**, as requested.

If you have any questions, please contact me at (505) 476-6035.

Sincerely,

Kevin Pierard

DEPARTMENT OF THE AIR FORCE
377TH AIR BASE WING (AFGSC)

MAY - 6 2021

Colonel David S. Miller, USAF
Commander
377th Air Base Wing
2000 Wyoming Blvd SE
Kirtland AFB NM 87117

Mr. Kevin M. Pierard
Hazardous Waste Bureau (HWB) Chief
New Mexico Environment Department (NMED)
2905 Rodeo Park Drive East Building 1
Santa Fe NM 87505-6303

Dear Mr. Pierard

Kirtland Air Force Base (AFB) has completed groundwater monitoring and sampling at nine wells associated with the in situ bioremediation (ISB) pilot test in accordance with the NMED-approved *Revised Final Ethylene Dibromide In Situ Biodegradation Pilot Test Work Plan, Bulk Fuels Facility, Kirtland Air Force Base, New Mexico, December 2016* (ISB Work Plan). During Phase 4 of the pilot test, the treatment zone was monitored for an extended period (January 2019 through October 2020) to continue evaluating performance of the ISB technology, including possible rebound of ethylene dibromide (EDB) concentrations at the nine groundwater monitoring, injection, and extraction wells. A total of five passive groundwater sampling events were conducted during Phase 4, the last of which was conducted in October 2020. Significant rebound of EDB was not observed since Phase 4 passive monitoring began in January 2019.

Based on recent groundwater results and completion of sampling in accordance with the ISB Work Plan, sampling at seven wells associated with the pilot test will cease entirely (KAFB-106MW1-S, KAFB-106MW1-I, KAFB-106MW2-S, KAFB-106MW2-I, KAFB-106EX1, KAFB-106EX2, and KAFB-106IN1) beginning in 2021 as these wells are not used to define the extent of groundwater contamination. Groundwater monitoring will continue at wells KAFB-106063 and KAFB-106064 semi-annually in accordance with the methodology outlined in the most recent NMED-approved Work Plan entitled *Work Plan for Bulk Fuels Facility Expansion of Dissolved-Phase Plume Groundwater Treatment System Design SWMUs ST-106/SS-111 Revision 2, January 2017*. Furthermore, these wells were incorporated into the consolidated groundwater monitoring work plan, *Work Plan for Groundwater Monitoring Bulk Fuels Facility SWMUs ST-106/SS-111*, submitted to NMED on April 27, 2021.

The pilot test has been completed in accordance with the ISB Work Plan. The aboveground components of the groundwater recirculation system and other infrastructure including electrical lines and conveyance piping, will be removed from the pilot test site. All groundwater monitoring, extraction, and injection wells associated with the pilot test will remain in place. The decommissioning of the pilot test equipment will be initiated in 45-days of the date that this letter is received by NMED unless otherwise directed.

If you have any questions regarding this request, please contact Mr. Sheen Kottkamp at (806)463-0811 or email sheen.kottkamp.1@us.af.mil.

DEPARTMENT OF THE AIR FORCE
377TH AIR BASE WING (AFGSC)

JUN 2 5 2021

Colonel Jason F. Vattioni, USAF
Commander
377th Air Base Wing
2000 Wyoming Blvd SE
Kirtland AFB NM 87117

Mr. Ricardo Maestas
Acting Hazardous Waste Bureau Chief
New Mexico Environment Department
Harold Runnels Building
1190 St. Francis Drive Suite N2050
Santa Fe NM 87502

Dear Mr. Maestas

A groundwater model is a predictive tool whose utility tends to diminish as sufficient field data are collected. The plume capture model employed by the U.S. Air Force (Air Force) to evaluate the efficacy of the pump and treat interim measure has been supplanted by actual data collected from the robust groundwater monitoring network. As summarized below, the discontinuation of this modeling is supported by the U.S. Environmental Protection Agency's (USEPA's) Guidance, "*A Systematic Approach for Evaluation of Capture Zones at Pump and Treat Systems, Final Project Report*" (USEPA 660/R-08/003, January 2008) (USEPA Guidance). The Air Force is therefore seeking approval from the New Mexico Environment Department (NMED) to discontinue the semiannual plume capture modeling related to this interim measure.

Background

The November 16, 2017 Notice of Deficiency (NOD) required the Air Force to perform the six-step plume capture analysis in accordance with USEPA Guidance. This NOD, which was issued ahead of the completion of NMED's formal review of the January 20, 2017 "Resource Conservation and Recovery Act Facility Investigation Report" (RFI Phase I), contained direction related to the potential impacts of the rising water table on the Air Force's "*...ability to complete a robust calculation of EDB* [ethylene dibromide] *plume mass and removal*". Specifically, the NOD required the development of a numerical or analytical model to address the impacts of "*...reduced resolution of monitoring data at the water table...*" from the rising water table.

The Air Force began semiannual plume capture modeling to support capture zone analysis and evaluate the performance of the interim measure in second quarter (Q2) 2018. The modeling results are presented in the Q2 and fourth quarter (Q4) periodic monitoring reports for the Bulk Fuels Facility (BFF), Solid Waste Management Units (SWMUs) ST-106/SS-111. Consistent with the iterative approach outlined in the USEPA Guidance, the Air Force has determined that capture is sufficient, modeling no longer adds value to the evaluation of the interim measure and that ongoing routine monitoring is sufficient to evaluate the future progress of the interim measure.

Summary of Six Step Systematic Evaluation of Capture Zones

Capture zone analysis, as detailed in the USEPA Guidance, is the process of evaluating field observations of hydraulic heads and groundwater chemistry to interpret the actual capture zone and then comparing the interpreted capture zone to a "Target Capture Zone" to determine if capture is sufficient. Specific techniques to assess the extent of capture achieved by the extraction wells are provided. Each of these techniques is subject to limitations, and in most cases no single line of evidence will conclusively differentiate between successful and failed capture. Therefore, developing "converging lines of evidence" by applying multiple techniques to evaluate capture increases confidence in the conclusions of the capture zone analysis. The systematic approach detailed in the USEPA Guidance is a six-step iterative process that advises the practitioner to obtain additional field information to address data gaps and ambiguities if present. Along each step of the process, the practitioner evaluates the completeness of the data set and how to address uncertainty. With each iteration, the need for simulated data and dependence on uncertainties is reduced and reliance on actual field monitoring and measurements is increased.

The six steps that are suggested for a systematic capture zone evaluation are: (1) review of available site data, site conceptual model, and remedy objectives; (2) determination of a site-specific target capture zone (TCZ); (3) interpretation of water level data; (4) calculations which may include estimating flow rate, capture zone width, and/or modeling (analytical or numerical) to simulate water levels, in conjunction with particle tracking and/or transport modeling; (5) evaluation of concentration trends, especially at down gradient monitoring wells; and (6) interpretation of actual capture based on the data obtained in the above five steps, comparison of the available data to the TCZ and evaluation of uncertainties and data gaps before the next iteration.

Basis of Request

In quarter four 2016, fifteen months after the first interim measure extraction well became active, the plume volume and mass were estimated at 114.7 million cubic feet and 104 grams, respectively. By the end of Q4 2020, the interim measure had extracted and treated approximately 1.026 billion gallons of groundwater, decreased the EDB plume volume by 89%, and reduced the overall EDB mass by 95%. The Interim Measure Operation Area (IMOA) is the part of the EDB plume that the pump and treat system is targeting and is illustrated on Figure 4-1 from the Q4 2020 Period Monitoring Report (see attached). Monitoring data collected in the IMOA demonstrates that the pump and treat system has successfully collapsed the targeted portion of the EDB plume and is currently containing the isolated EDB detections north of Ridgecrest Drive.

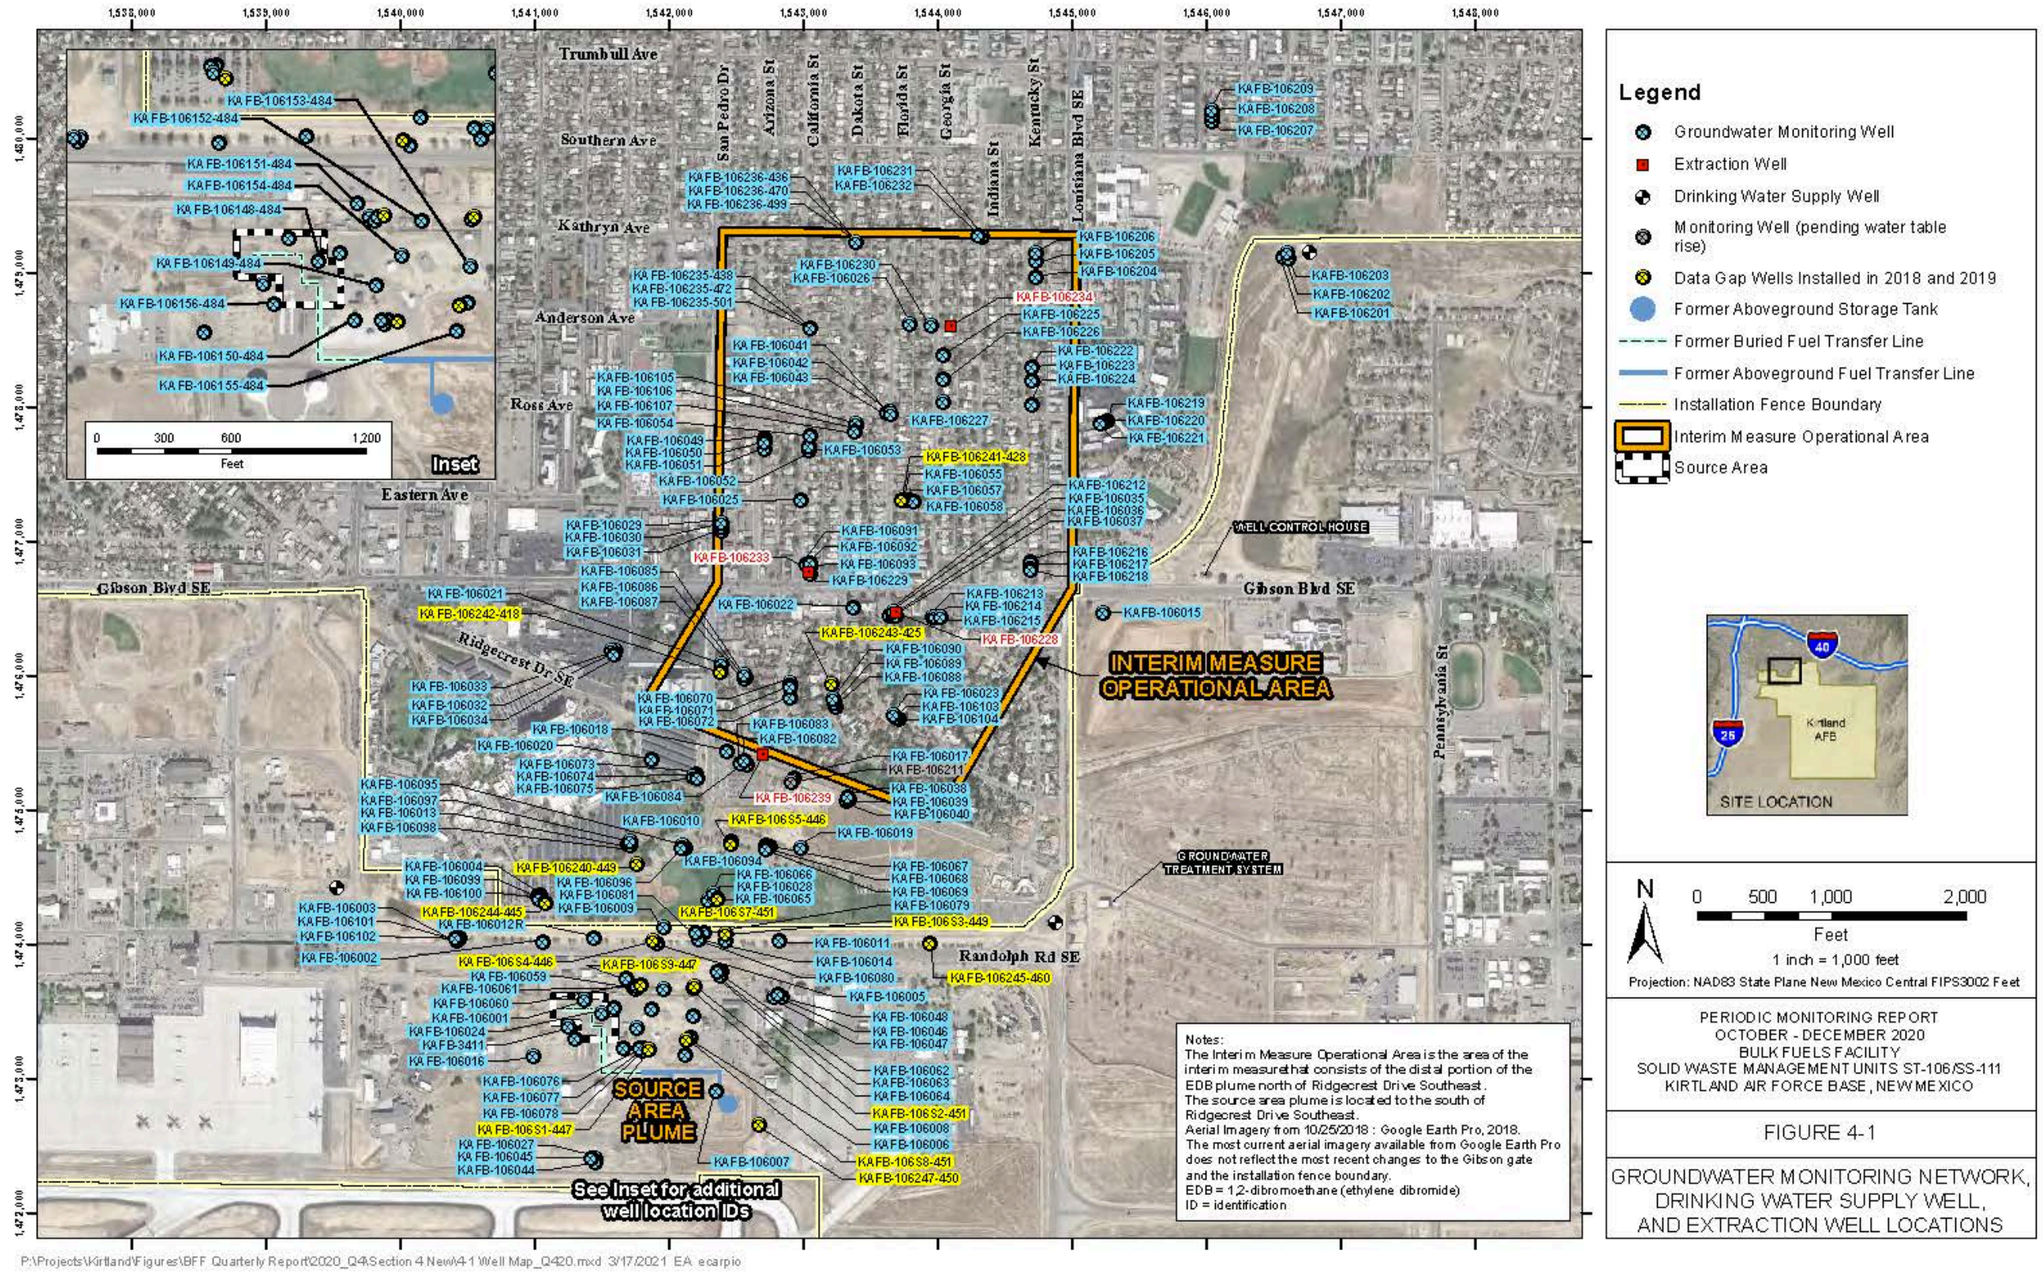
As illustrated on Figure 4-9 from the Q4 2020 Period Monitoring Report (see attached), EDB was not detected in any of the deep monitoring wells site wide. Of the 82 groundwater monitoring wells within the IMOA north of Ridgecrest Drive, 76 wells were either below USEPA maximum contaminant level (MCL) or non-detect. All groundwater monitoring wells that produced a detection above the MCL have down gradient monitoring wells with non-detect values.

Over the past several years of model development, pumping rates and hydraulic parameters have been established and are now well understood, and no further estimation of aquifer parameters are anticipated at present or in the near future. Therefore, based on the information provided above, Step 4 of the six step process will be accomplished in the future by performing simple horizontal analyses related to capture by using the known extraction rates and parameters to calculate the capture zone width. This line of evidence will then be combined with Step 5 using the vast amount of data that has been collected to support trend analysis within the IMOA.

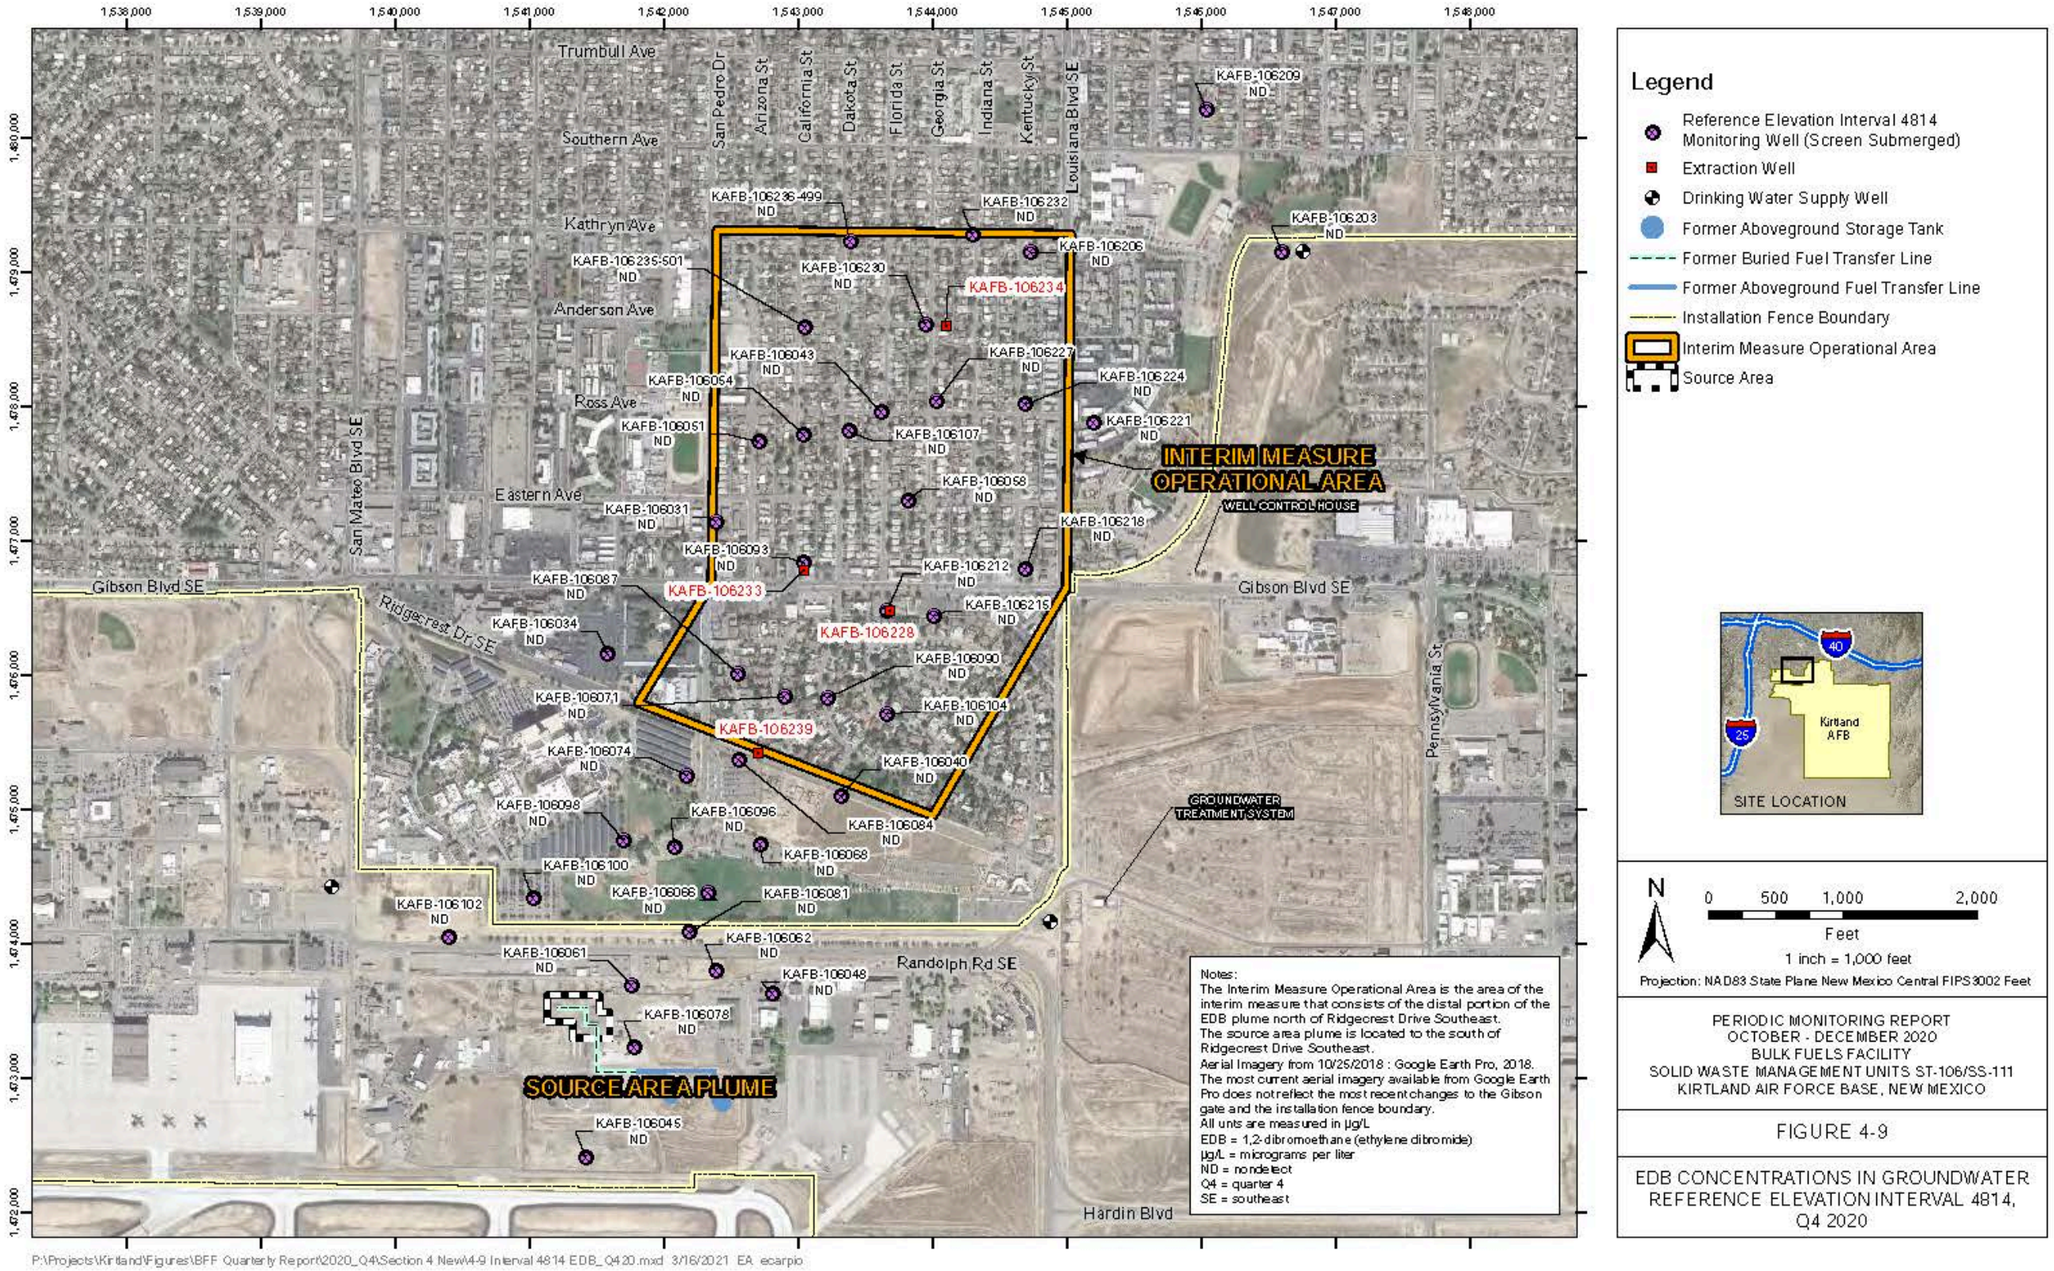
USEPA Guidance points out that capture zone analysis based on concentration trends can be complicated by several factors including: 1) limited chemical concentration data; 2) long time periods (years) to interpret concentration data related to capture; 3) multiple hydrogeological units; and 4) multiple releases. However, a review of each of these factors as they relate to the Kirtland BFF demonstrates that none of the above factors are present. Over the last four years of interim measure operations, the Air Force has collected chemical data and hydraulic monitoring information that spans 16 quarterly sampling events. Based on the

current conceptual site model, the BFF has only one hydrogeological unit that was impacted by fuels resulting from a single release. Therefore, none of the complicating factors identified in the USEPA Guidance exist at the Kirtland AFB BFF site.

USEPA Guidance states that conducting concentration trend analysis at down gradient performance monitoring wells over time may ultimately provide the most solid and compelling line of evidence that successful capture has been achieved. Furthermore, hydraulic and chemical monitoring should be components of capture zone evaluations. As indicated above, each extraction well that is a component of the interim measure is surrounded by an extensive groundwater monitoring well network in the IMOA. The extensive and robust monitoring well network spans three groundwater horizons ensuring continuous monitoring of EDB concentrations both laterally and vertically. Finally, the USEPA Guidance states that capture zone effectiveness is ultimately determined by field monitoring that typically includes some combination of hydraulic head measurements and groundwater sampling and analysis. Based on the information provided above, the Air Force is seeking approval from NMED to discontinue the semiannual modeling efforts related to the interim measure.



As the Q2 2021 Groundwater Monitoring Report is currently under development, the Air Force would appreciate your prompt attention to this matter. If you have any questions or concerns, please contact Mr. Sheen Kottkamp at commercial line (505) 846-7674 or email sheen.kottkamp.1@us.af.mil.



Sincerely

JASON F. VATTIONI, Colonel, USAF
Commander

APPENDIX A-2

Response to Regulatory Comments

Common Comment and Response Worksheet (Version 3)				
Date	**Reviewer**		**Document Title (version)**	**Contract/TO Number**
7/11/2020[a]	**NMED HWB**		**Quarterly Monitoring Report for April-June 2019 Bulk Fuels Facility Solid Waste Management Units ST-106/SS-111 Kirtland Air Force Base, New Mexico**	**NMED Permit No. NM9570024423**
Item	**Section**	**Page**	**Comment**	**Response**
1	General Comments	1	**1. Monitoring Report Contents** **NMED Comment:** Based on the issues identified in this report and other periodic reports, NMED is providing the following reporting requirements which the Permittee must incorporate into future reports. Permittee is required to include the following as applicable: **a.** The response to NMED's comments must be included as Appendix A of each document revision.	The response to New Mexico Environment Department's (NMED's) comments are included as Appendix A-2 beginning with the Quarter 2 (Q2) 2020 Quarterly Report and going forward.
2	General Comments	1	**1. Monitoring Report Contents** **NMED Comment:** Based on the issues identified in this report and other periodic reports, NMED is providing the following reporting requirements which the Permittee must incorporate into future reports. Permittee is required to include the following as applicable: **b.** All field methods for the project must be documented in an appendix, as required by Permit Section 6.2.4.4.11. The documentation must be specific to each monitoring activity, such as soil vapor monitoring, groundwater monitoring, or operation and maintenance of the groundwater treatment system. References to quality assurance project plans (QAPPs), standard operating procedures (SOPs), or work plans are not acceptable. All deviations from approved work plans must be discussed and explained in a Deviations section.	Field methods for the project are included as Appendix B-1 beginning with the Quarter 3 (Q3) 2020 Quarterly Report and going forward. References to QAPPs and SOPs were not included in the field methods appendix. Deviations are discussed in the main text.
3	General Comments	1	**1. Monitoring Report Contents** **NMED Comment:** Based on the issues identified in this report and other periodic reports, NMED is providing the following reporting requirements which the Permittee must incorporate into future reports. Permittee is required to include the following as applicable: **c.** Wells must be consistently referred to by the same name/designation in all periodic reports, sections of the text, tables, and figures. The designations must match those provided in the digital analytical data files.	Wells are referred to consistently throughout this document. A table listing any historical changes to well designations that can be used for cross reference purposes is provided as Appendix B-2 beginning with the Q3 2020 Quarterly Report and going forward.
4	General Comments	1	**1. Monitoring Report Contents** **NMED Comment:** Based on the issues identified in this report and other periodic reports, NMED is providing the following reporting requirements which the Permittee must incorporate into future reports. Permittee is required to include the following as applicable: **d.** Sampling data tables must include the practical quantitation limit (PQL) and listed laboratory report detection limit (RDL) for each analysis.	In accordance with Department of Defense (DoD) quality management policy, the laboratory is required to use specific DoD Quality Systems Manual (QSM) reporting limit nomenclature when reporting data. However, the DoD nomenclature is comparable to U. S. Environmental Protection Agency (EPA) method reporting nomenclature. To clarify, beginning with the Q2 2020 Report and going forward, an analytical data Excel flat file is being provided in an appendix with each sample matrix type to include the PQL (limit of quantification [LOQ] per DoD), RDL (limit of detection [LOD] per DoD) and method detection limit (MDL) (detection limit [DL] per DoD). See response to Comment 8 below.
5	General Comments	1	**1. Monitoring Report Contents** **NMED Comment:** Based on the issues identified in this report and other periodic reports, NMED is providing the following reporting requirements which the Permittee must incorporate into future reports. Permittee is required to include the following as applicable: **e.** Sampling data tables must include the appropriate screening levels for data comparison.	Sampling data tables will include the relevant appropriate screening levels. As discussed in Section 2, soil vapor results were compared to vapor intrusion screening levels (VISLs) at the 25-foot depth interval. Soil vapor data tables listing results for deeper soil vapor monitoring points (SVMPs) are not compared to VISLs.
6	General Comments	1	**1. Monitoring Report Contents** **NMED Comment:** Based on the issues identified in this report and other periodic reports, NMED is providing the following reporting requirements which the Permittee must incorporate into future reports. Permittee is required to include the following as applicable: **f.** Analytical data tables in digital format must include a column that indicates which analytical data report the specific sample information can be found. This link must correspond to the analytical data report file name.	Analytical data flat files in Excel are being provided in the appendices (see response to Comment 8 below) and include a column which identifies the analytical laboratory data report file name where the specific sample information can be located.
7	General Comments	1	**1. Monitoring Report Contents** **NMED Comment:** Based on the issues identified in this report and other periodic reports, NMED is providing the following reporting requirements which the Permittee must incorporate into future reports. Permittee is required to include the following as applicable: **g.** Data quality exceptions, such as when the PQL exceeds the corresponding screening level, must be identified as such in all tables and figures (see Permit Section 6.5.18).	Exceedances of the PQL are provided in the sortable, searchable Excel tables provided as appendices in the Q2 2020 Report and future reports (see response to Comment 8 below). Beginning in the Q3 2020 Report, a discussion and table of PQL exceedances above the corresponding screening level where the analytical result is estimated (J-flagged) are included in the Data Quality Evaluation Report appendices to the report. The exceptions will also be noted on figures beginning in the Q3 2020 Report.
8	General Comments	1	**1. Monitoring Report Contents** **NMED Comment:** Based on the issues identified in this report and other periodic reports, NMED is providing the following reporting requirements which the Permittee must incorporate into future reports. Permittee is required to include the following as applicable: **h.** Analytical data provided in digital format such as Microsoft Excel or Access files must be provided in a sortable, searchable format. Previous reports have provided digital data in the same format as the printed tables. These tables are not sortable or searchable. Provide the tables in a standard database format.	Beginning in the Q2 2020 Report and going forward, analytical data tables provided as appendices will be provided in the sortable, searchable Excel standard database format. The tables being provided can be found in appendices titled: • Soil Vapor Analytical Data (Q2 and Q4 Reports only) • Groundwater Analytical Data • Drinking Water Supply Well Analytical Data • Groundwater Treatment System Performance Analytical Data

Common Comment and Response Worksheet (Version 3)				
Date	**Reviewer**		**Document Title (version)**	**Contract/TO Number**
7/11/2020[a]	**NMED HWB**		**Quarterly Monitoring Report for April-June 2019 Bulk Fuels Facility Solid Waste Management Units ST-106/SS-111 Kirtland Air Force Base, New Mexico**	**NMED Permit No. NM9570024423**
Item	**Section**	**Page**	**Comment**	**Response**
9	General Comments	1	**1. Monitoring Report Contents** **NMED Comment:** Based on the issues identified in this report and other periodic reports, NMED is providing the following reporting requirements which the Permittee must incorporate into future reports. Permittee is required to include the following as applicable: **i.** Analytical data packages must be submitted in accordance with KAFB Permit Section 6.5.18.2, Laboratory Deliverables.	Beginning in the Q3 2020 Report and going forward, EPA Level II data packages will be provided with the report, and EPA Levels III and IV will be maintained and available to NMED upon request in accordance with Resource Conservation and Recovery Act (RCRA) Permit Section 6.5.18.2 (see response to Item 20 below).
10	General Comments	1	**1. Monitoring Report Contents** **NMED Comment:** Based on the issues identified in this report and other periodic reports, NMED is providing the following reporting requirements which the Permittee must incorporate into future reports. Permittee is required to include the following as applicable**:** **j.** All tables, figures, and appendices must be appropriately numbered and titled.	Tables, figures, and appendices will be appropriately numbered and titled in this document. Headers and footers with appropriate page numbering and titles will be applied to all figures, tables, and appendices.
11	General Comments	1	**1. Monitoring Report Contents** **NMED Comment**: Based on the issues identified in this report and other periodic reports, NMED is providing the following reporting requirements which the Permittee must incorporate into future reports. Permittee is required to include the following as applicable: **k.** Every page of every submittal, including all pages within all sections and appendices, must be numbered either sequentially or in some other format acceptable to NMED.	See Comment 10 above.
12	General Comments	2	**2. Analytical Data Detection and Quantitation Limits** **NMED Comment:** (Paragraph 1) Many of the analytical data tables presented in the Report list the limit of detection (LOD) for each sample analysis, however, it is not clear if this value represents the laboratory method detection limit or reporting detection limit. Some tables list the LOD and some the limit of quantification (LOQ). The permittee must provide the method detection limit (MDL) in the data tables. In addition, the Permittee must include the reporting detection limit (assuming this is the Permittee's "LOD") and the PQL (assuming this is the Permittee's "LOQ") for each sample analyzed in the data tables.	As noted in Comment 4 above, the required laboratory reporting is per DoD QSM reporting requirements. For clarification, the DoD DL is equivalent to the EPA MDL, the DoD LOD is equivalent to the EPA RDL, and the DoD LOQ is equivalent to the EPA PQL. To further clarify this, we have included an analytical data Excel flat file in an appendix with each sample matrix type to show the specific PQL, RDL, and MDL for each sample analyte.
13	General Comments	2	**2. Analytical Data Detection and Quantitation Limits** **NMED Comment:** (Paragraphs 2 and 3) The Permittee's Quality Assurance Project Plans (QAPPs) indicate that the Permittee is using three different variations of terminology for method reporting limits, including one which seems to be backwards. The Permittee's QAPP for Vadose Zone Treatability Studies Attachment 1, Tables 1-1a, Method Reporting Limits – Drinking Water, 1-1b, Method Report Limits – Soil and Investigation Derived Waste, and 1-1c, Method Reporting Limits – Volatile Organic Compounds in Air, all seeming use the LOQ appropriately (as the PQL), but there is a lack of consistency between the method detection limit and reporting detection limit. In Table 1-1a, Drinking Water, "MDL" appears to equate to the method detection limit, and "LOD" appears to equate to the reporting detection limit. In Table 1-1b, Soil, "LOD" appears to equate to the method detection limit and "DL" appears to equate to the reporting detection limit. Based on the fact that the PQL must be greater than the reporting detection limit and the reporting detection limit must be greater than the method detection limit, Table 1-1b, Soil, appears to be wrong. NMED is assuming that similar tables appear in the QAPP for quarterly monitoring.	The Vadose Zone Treatability QAPP includes method reporting limit tables for TestAmerica, Inc. Laboratories for drinking water, soil coring and investigation-derived waste, and soil vapor. It appears on the reporting limit table 1-1b, Soil, the values in the LOD and DL columns were inadvertently switched. It is correct that the LOQ/PQL is greater than the LOD/RDL, which is greater than the DL/MDL. The reporting limit tables in the QAPP for the Dissolved-Phase Plume and Groundwater Treatment System Design (quarterly groundwater monitoring), Attachment 1 (Eurofins Lancaster Laboratories) are confirmed to be correct.
14	General Comments	2	**2. Analytical Data Detection and Quantitation Limits** **NMED Comment:** (Paragraph 4) These issues [items 12 and 13 above] cause confusion for the reviewer, community stakeholders, and the public, and increases the time required to review submittals from the Permittee. The Permittee must use appropriate and consistent terms for Quality Assurance/Quality Control in all periodic reporting submittals and for all media (e.g., use MDL consistently instead of DL). While NMED does not review or approve QAPPs, the Permittee must assure that they are providing their contractors with the appropriate information to provide appropriate, consistent, and accurate information to NMED. Consistency in reporting by the Permittee will reduce both agency and Air Force internal review times.	See Comment 12 and 13 above.

Common Comment and Response Worksheet (Version 3)				
Date	**Reviewer**		**Document Title (version)**	**Contract/TO Number**
7/11/2020[a]	**NMED HWB**		**Quarterly Monitoring Report for April-June 2019 Bulk Fuels Facility Solid Waste Management Units ST-106/SS-111 Kirtland Air Force Base, New Mexico**	**NMED Permit No. NM9570024423**
Item	**Section**	**Page**	**Comment**	**Response**
15	Specific Comments	2/3	**3. Table of Contents, Appendix B, page iv:** **NMED Comment:** Appendix B, New Activities Supporting Information, contains well completion reports for four new wells installed and developed in accordance with the NMED-approved 2017 Work Plan for Vadose Zone Coring, Vapor Monitoring, and Water Supply Sampling. KAFB Permit Section 6.2.2.1.2, Site Investigations – Investigation Reports, and Section 6.2.4.3, Reporting Requirements – Investigation Reports, require that the information and data collected from all investigation activities conducted during the quarter be submitted to NMED as separate, stand-alone reports. The Permittee must submit individual reports for all investigation activities conducted in support of the ongoing investigation of the Bulk Fuels Facility spill, rather than submit the information as appendices in quarterly reports.	The information and data collected from investigation activities, such as well completion reports, will be provided as stand-alone reports or as otherwise required by NMED and will not be provided as appendices to quarterly reports.
16	Specific Comments	3	**4. Section 2.5 Q2 2019 Soil Vapor Data, page 2-4:** **Permittee Statement:** "The RCRA permit does not specify cleanup levels for soil vapor. The quarterly reports are not intended to assess risk; the vapor data are used to assess concentration trends. The risk assessment (USACE, 2017e) compares vapor concentrations to the vapor intrusion screening levels in the NMED Risk Assessment Guidance for Site Investigations and Remediation. All EDB and benzene concentrations are compared against 3,800 and 3,200 micrograms per cubic meter (µg/m3), respectively. HC concentrations are compared against 1,000 parts per million by volume (ppmv). The comparison concentrations used in this report were determined by historical maximum and minimum soil vapor results to show which SVMPs had relatively high or low concentrations." **NMED Comment:** The Permittee must clarify if the comparison values for EDB, benzene, and HC represent the historical maximum or minimum, or some other calculated value so that changes relative to the values can be evaluated. The Permittee must also provide a reference for the historical soil vapor values. The Permittee accurately states that quarterly reports are not intended to assess risk; however, the Permittee must provide a comparison of detected concentrations to a regulatory standard for the purpose of assessing the presence and location of contaminants of concern. NMED's Risk Assessment Guidance for Site Investigations and Remediation (2019 and as updated) vapor intrusion screening levels (VISLs) must be used a first-tier screening assessment.	In the Q2 2020 Report, language was revised to clarify that the comparison values were set based on a qualitative analysis of soil vapor data in Q2 2016 to help the reader distinguish areas of relatively high or low soil vapor concentrations (Section 2.3). They were not intended to be screening levels, rather their purpose is as a helpful tool for the reader to evaluate trends. Comparison levels were removed from the report beginning in Q4 2020. Beginning in Q4 2020, NMED's Risk Assessment Guidance for Site Investigations and Remediation (2019 and as updated) VISLs were used as a first-tier screening assessment. NMED VISLs were calculated utilizing EPA default attenuation factors that are based on conservative assumptions and empirical data. VISLs are intended to be screened against soil vapor samples collected from below building foundations (sub slab samples). However, the shallowest SVMPs at SWMUs ST-106/SS-111 are screened from 15 to 25 feet (ft) below ground surface. Therefore, using NMED VISLs as a first-tier screening level for soil vapor concentrations at the 25-ft horizon provides a conservative estimate. NMED VISLs are not appropriate screening levels for deeper SVMPs. Kirtland AFB is currently in coordination with USACE-Albuquerque District to determine the most appropriate screening criteria for evaluating soil vapor at depth at the Kirtland Bulk Fuels Facility. Pending resolution, data will be screened in the manner indicated above in future reports. Table 3-6 includes the results of screening the 25-ft horizon against residential soil gas VISLs. This screening is for comparison purposes only and should not be considered an evaluation of exposure or risk.
17	Specific Comments	3	**5. Section 2.2. Bioventing Pilot Test, page 2-2** **Permittee Statement:** "A bioventing report will be submitted on January 31, 2020 as requested by NMED in a letter dated February 25, 2019 (NMED, 2019). This report will include data collected up to Q4 2019. Data collected after Q4 2019 will be provided in the relevant quarterly monitoring reports. The Q4 2020 Quarterly and Annual Monitoring Report will include results to date, and the final results of the bioventing pilot test will be provided in the Q4 2021 Quarterly and Annual Monitoring Report." **NMED Comment:** Bioventing pilot test data is collected each quarter; therefore, the Permittee must provide quarterly data updates in separate quarterly status reports specific to the bioventing pilot study to allow NMED to provide timely adjustment and inputs to the bioventing system. The final results of the bioventing pilot test must be submitted as a stand-alone document rather than as an appendix to the Q4 2021 Quarterly and Annual Monitoring Report.	Future bioventing reports will be removed from quarterly reports. The final results of the bioventing pilot test will be submitted as a stand-alone document.

Common Comment and Response Worksheet (Version 3)				
Date	**Reviewer**		**Document Title (version)**	**Contract/TO Number**
7/11/2020[a]	**NMED HWB**		**Quarterly Monitoring Report for April-June 2019 Bulk Fuels Facility Solid Waste Management Units ST-106/SS-111 Kirtland Air Force Base, New Mexico**	**NMED Permit No. NM9570024423**
Item	**Section**	**Page**	**Comment**	**Response**
18	Specific Comments	3	**6. Section 3.3.1 Sampling Deviations, page 3-3** **Permittee Statement:** "Groundwater samples were not obtained from seven wells in Q2 2019. Three wells (KAFB-106001, KAFB-106008, and KAFB-106079) could not be sampled due to suspected biofouling. These wells will be sampled using passive sampling techniques in the future after well rehabilitation is evaluated." **NMED Comment:** The Permittee must provide additional information in a subsequent quarterly report on suspected biofouling of wells KAFB-106001, KAFB-106008, and KAFB-106079, such as evidence for biofouling, the source of biofouling, and the date when biofouling was first suspected. Well KAFB-106079 is less than 1000 ft from interim measure extraction well KAFB-106239. Provide information on the potential for suspected biofouling at KAFB-106079 to impact KAFB-106239 and the Groundwater Treatment System. The Permittee must also submit a work plan for evaluating and conducting rehabilitation of the three wells. Use of passive sampling techniques for wells KAFB-106001 and KAFB-106079 is contingent upon NMED approval. Because LNAPL was previously detected in well KAFB-106008, use of passive sampling is not appropriate.	The following additional information on suspected biofouling of wells KAFB-106001, KAFB-106008, and KAFB-106079, along with a discussion of the potential for biofouling at KAFB-106239, is provided only in this response to comments table, as this was not part of Q3 2020 groundwater monitoring activities discussed in the main text of this quarterly report. A similar discussion will be included in future quarterly reports for wells suspected of biofouling during the relevant quarter. During the Q2 2019 groundwater sampling event, the sampling team was unable to purge wells KAFB-106001, KAFB-106008, and KAFB-106079. Sampling was attempted at these three wells on May 1, April 23, and April 26, 2019, respectively. The pumps were removed, and biologic films were observed on the pump screens. The biologic films were thick enough to prevent water from entering the screens. The screens were cleaned, and another attempt to pump was made; however, the biologic material occluded the screens again, preventing water from entering the pump. These wells were disinfected in Q3 2019 in accordance with the approved procedures (see paragraph below), and disinfection was reported in the Q3 2019 Report. These three wells are in areas with historically high benzene, toluene, ethylbenzene, and total xylenes concentrations and anaerobic conditions. As discussed in Section 7 of the Phase I RCRA Facility Investigation Report (Kirtland AFB, 2018, *Phase I RCRA Facility Investigation Report, Bulk Fuels Facility Releases, Solid Waste Management Unit ST-106/SS-111*, prepared by Sundance Consulting, Inc. for Kirtland AFB under USACE-Albuquerque District Contract No. W912PP-16-C-0002. August), concentrations of microbial indicator compounds suggest that microbial degradation is occurring in this area. KAFB-106239 experiences a periodic decrease in pumping rates, which is an indicator of biofouling. When this occurs, it is disinfected in accordance with approved procedures (see paragraph below), and disinfection is discussed in the relevant quarterly report. Standard well disinfection procedures were provided in the Operation and Maintenance Plan (Kirtland AFB. 2016. Operation and Maintenance Plan, Groundwater Treatment System, Bulk Fuels Facility, SWMUs ST-106/SS-111, Kirtland Air Force Base, New Mexico.), which was approved by NMED in a letter dated December 12, 2016 (Correspondence from Kathryn Roberts, Director, Resource Protection Division to Colonel Eric H. Froehlich, Base Commander, Kirtland AFB, New Mexico, and Mr. John Pike, Director, Environmental Management Division, 377 MSG, Kirtland AFB, New Mexico, re: Operation and Maintenance Plan, Groundwater Treatment System, Bulk Fuels Facility Solid Waste Management Units ST-106/SS-111, Kirtland Air Force Base, EPA ID No. NM9570024423, HWB-KAFB-13-MISC.). Disinfection of these wells took place in September 2019 and was reported on in the Q3 2019 Report. Wells KAFB-106001, KAFB-106079, and KAFB-106008 will be sampled using portable pumps in future monitoring quarters until such time as passive sampling is approved by NMED.
19	Specific Comments	4	**7. Section 3.6.1.1 EDB Analytical Results, page 3-5** **Permittee Statement:** "Five EDB exceedances were from wells north of Ridgecrest Drive SE but none were north of Gibson Boulevard SE." **NMED Comment:** Figures 3-5 and 3-6 present EDB concentrations in groundwater for reference elevation 4857 and 4838, respectively. Both figures depict the northern extent of the EDB plume as being north of Gibson Boulevard SE. The Permittee must revise the statement and figures for accuracy if they are included in future periodic reports.	The Permittee statement from the Q2 2019 Report was verified as accurate. While some wells north of Gibson Boulevard SE (Gibson) had EDB detections, there were no EDB exceedances above the EPA MCL of 0.05 micrograms per liter in wells sampled north of Gibson in Q2 2019. Because some of the wells with exceedances were immediately south of Gibson, interpolation of the plume boundary shows the northern boundary extending approximately 100 ft to the north of Gibson. However, no wells located north of Gibson are included within the plume boundary.

[a]The date was incorrectly recorded as 7/11/2019 on the letter.

Date	Reviewer		Document Title (version)	Contract/TO Number

The following items address comments provided in the September 2, 2020 letter that were not addressed by the July 11, 2020 letter. Comments 3 and 4 did not require edits to Periodic Monitoring Reports. Comments 5, 6, 7, 8a through 8f, 8i through 8k, and 9 were addressed by the July 11, 2020 letter.				
Item	**Section**	**Page**	**Comment**	**Response**
1	Letter	2	**1. Laboratory Deliverables:** Section 6.5.18.2, Laboratory Deliverables, of the KAFB Resource Conservation and Recovery Act (RCRA) Permit (KAFB Permit), states the requirements for analytical laboratory reporting. The section states, "[l]aboratory analytical data packages shall be prepared in accordance with EPA-established Level III or IV analytical support protocols." The final paragraph of the permit section goes on to state, "[t]he Permittee shall present summary tables of these data and Level II QC results to the Department in reports or other documents prepared in accordance with Permit Section 6.2.4. Raw analytical data, including calibration curves, instrument calibration data, data calculation work sheets, and other laboratory supporting data for samples from this project, shall be compiled and kept on file at the Facility for reference. The Permittee shall make all data available to the Department upon request." Therefore, for purposes of reporting, Level II Qc results are necessary. Level III and IV data must be maintained by the Permittee to be made available upon request.	This comment clarifies Comment 9 above. Beginning with the Q3 2020 Report and going forward, Level II rather than Level IV data packages will be provided with the report, and Level III and Level IV will be available upon request.
2	Letter	2	**2. General Guidelines:** NMED has included an attachment titled *General Reporting Guidelines* that provides guidance regarding its expectations of submittals to the Hazardous Waste Bureau. The Permittee must consult the guidance during document preparation.	Section 4 of the *General Reporting Guidelines*, Periodic Monitoring Report, was consulted during the preparation of the Q3 2020 Report, and revisions were made as discussed in Comments 7 and 8 below.
5	Letter	3	**8. Data Tables, Figures, and Appendices** **g.** Data in tables and figures must be presented with a consistent and appropriate number of significant figures.	Significant figures provided are reviewed to ensure they are appropriate to the task and the level of precision attainable by the instruments used.
6	Letter	3	**8. Data Tables, Figures, and Appendices** **h.** All points (wells), structures, infrastructure, roads, etc. depicted on figures must be labeled.	Figures are reviewed to ensure that the relevant wells, structures, infrastructure, roads, etc. are labeled or described in the legend.
7	General Reporting Guidelines	17	**Section 4.11 Tables** The following tables must be included, as applicable: **b**. a table summarizing groundwater and vadose zone fluid elevations, and depths to water data; the table must include the monitoring well depths, casing elevations, the screened intervals in each well, and the dates and times of measurements.	Beginning in Q3 2020, Table 3-2, Groundwater Elevation and Light Non-Aqueous Phase Liquid Thickness, was revised to include well depth, bottom of screen, and measurement times. The other required information, including top of screen, was already present in the table.
8	General Reporting Guidelines	17	**Section 4.11 Tables** The following tables must be included, as applicable: **e.** a table summarizing field measurements of groundwater and vadose zone fluid quality data (including historical water quality data as described above).	A table summarizing field measurements, including historical water quality data, was added to Appendix E-3. In Q2 and Q4 of each year, a table summarizing field measurements from the current sampling event will continue to be provided (Table 3-5 in the Q2 2020 report).

B-1.1 FIELD MEASUREMENTS

The field methods described below were followed when performing field operations at the Solid Waste Management Units ST-106/ST-111 at Kirtland Air Force Base (AFB) in Albuquerque, New Mexico.

Work was performed in accordance with the Part 6.5.4 of Resource Conservation and Recovery Act (RCRA) Hazardous Waste Treatment Facility Operating Permit No. NM9570024423 (RCRA Permit) (New Mexico Environment Department [NMED] 2010).

B-1.1.1 Air Quality

Headspace air quality measurements were collected each time a groundwater monitoring (GWM) well was opened to ensure a safe working environment. Headspace was monitored using a photoionization detector (PID) reading total volatile organic compounds (VOCs) in parts per million by volume (ppmv). During use, each PID was calibrated in accordance with the manufacturer's instructions weekly and bump tested daily. The PID was calibrated when the results of the bump test were outside of the accepted range. The PID was used to determine the total VOCs at the top of the well to ensure a safe working environment. If the headspace reading was greater than 5.0 ppmv in the breathing zone, the field team ventilated he well vault.

B-1.1.2 Water Quality

Water quality measurements were collected as part of multiple sampling events including GWM, drinking water production well monitoring, and sampling at the groundwater treatment system (GWTS). Two types of instruments were used: a multiparameter meter and a turbidity meter.

A multiparameter meter was used to measure the following parameters: temperature, dissolved oxygen (DO), specific conductance, pH, and oxidation reduction potential (ORP). Turbidity was measured using a turbidity meter. The multiparameter meter can be used in two manners: either equipped with a flow-through cell or by being submerged in water collected from the flow in a cup. Multiparameter meters were calibrated in accordance with the manufacturer's instructions at the inception of a field sampling event and weekly thereafter. A bump test was performed daily. If the results of the bump test were outside of the accepted range, the instrument was calibrated.

The turbidity meter was calibrated at the beginning of the sampling event and bump tested weekly. If the results of the bump test were outside of the accepted range, the instrument was calibrated. Water was collected in a clear glass jar that was inserted into the instrument for the turbidity measurement.

B-1.2 SYNOPTIC GAUGING

B-1.2.1 OPENING GROUNDWATER MONITORING WELLS

GWM wells were opened during synoptic gauging, groundwater sampling, and in conjunction with other periodic activities as needed (i.e., well rehabilitation). Field teams don Level D personal protective equipment (PPE) prior to opening well vaults. Field teams then removed the bolts and placed the vault lid to the side. In wells without dedicated equipment, the well cap was unscrewed and set to the side. In wells with dedicated equipment, the stopper was removed from the drop pipe and set to the side.

B-1.2.2 GAUGING LIQUID LEVELS

Groundwater and light non-aqueous phase liquid (LNAPL) gauging was conducted in accordance with Part 6.5.17.2 of the RCRA Permit (NMED, 2010) and the approved work plans (Section B-1.1). While the RCRA Permit does not specify technical requirements for LNAPL gauging, the measurements were collected concurrent with groundwater gauging and therefore follow the same procedure. Groundwater and LNAPL gauging was conducted quarterly at each of the wells in the GWM program. Monitoring wells were gauged within a synoptic period of no more than 5 consecutive days (Kirtland AFB, 2017b).

Prior to gauging, the interface probes designated for use were used to measure depths to water in three GWM wells to quantify any measurement difference from a control probe. If a probe consistently measured greater than 0.03 ft different from the control probe, water levels taken using that probe were corrected by the value of the difference. Over a 3-day period, barometric pressure changes at the site can cause water levels in a given well to vary by up to 0.15 ft, even after diurnal variations are taken into account. This was determined by observing the change in water levels due to barometric pressure at three wells during a 7-day background monitoring period prior to aquifer testing at KAFB-106228 (Kirtland AFB, 2016b). Therefore, a measurement difference between probes of up to 0.03 ft, or less than 20 percent (%) of 0.15 ft, was considered negligible as compared to these naturally occurring changes.

The sequence of procedures used when measuring depth to water was as follows:

Step 1. Wells that required barricading for access were identified and the required barricade permits were obtained. As soon as was practicable, gauging was scheduled in conjunction with sampling to minimize disruption of traffic and access for residents.

Step 2. Wells were segregated based on known status of contamination. Wells were gauged with interface probes designated for “clean” or “contaminated” wells. Although interface probes were decontaminated between wells, this approach further minimized the potential for cross-contamination.

Step 3. Samplers donned new sampling gloves at each well before beginning gauging.

Step 4. Operation of measurement equipment was checked aboveground.

Step 5. The exterior of the monitoring well was examined for signs of damage or tampering and observations were recorded on the Monitoring Well Gauging Form.

Step 6. The well cap or outer steel casing lid was unlocked. The interior of the monitoring well was visually examined for signs of damage or tampering and observations were recorded on the Monitoring Well Gauging Form.

Step 7. Immediately upon opening the cap, VOC vapor readings were obtained with a PID at the well head and information was recorded on the Monitoring Well Gauging Form. If concentrations greater than 5 ppmv were detected, the well vault was ventilated.

Step 8. The interface probe was lowered into the GWM well and the depth to LNAPL, if any, was noted along with the depth to groundwater. Measurements were taken from a reference mark located on either the top of the protective casing for wells with aboveground completion or from the top of the vault for wells with flush completion. Measurements were made to the nearest 0.01 ft.

Step 9. Gauging information was recorded on the field form.

Step 10. The time and day of the measurement was recorded on the field form.

Step 11. The interface probe was decontaminated before and after each use to prevent potential cross-contamination of wells.

If a well was found to contain more than 0.02 ft of LNAPL, it was bailed with a disposable bailer prior to sampling. The removed LNAPL was disposed of as hazardous waste at an offsite facility. Bailing was not be performed for wells that were only gauged and not sampled.

B-1.3 GROUNDWATER SAMPLING

Groundwater was sampled in accordance with the requirements in Part 6.5.17.3 of the RCRA Permit (NMED, 2010) and the approved work plans (Section B-1.1). Groundwater samples were collected using either a passive sampling device or low-flow techniques.

Following removal of the passive sampling device or the completion of purging, samples were collected into appropriate clean containers with the relevant preservatives. Sample aliquots that were sent to the laboratory for dissolved metals analysis were filtered in the field immediately after collection through a disposable filter with a 0.45-micron nominal pore size, in accordance with the requirements in Part 6.5.17.5 of the RCRA Permit (NMED, 2010).

B-1.3.1 PASSIVE SAMPLING

GWM wells located north of Ridgecrest Drive SE were approved by NMED to utilize passive sampling technologies (NMED, 2017d) following sampling evaluations that showed comparable analytical results in samples collected using passive and low-flow technologies. In addition, regardless of location, wells less than 4 inches in diameter were sampled using passive technologies as the diameter is too small to accept a low-flow pump. The approval of passive sampling (NMED, 2017d) meets the requirement in Part 6.5.17.4 of the RCRA Permit (NMED, 2010) that states, "The Permittee may submit to the department for approval, a written request for a variance from the described method of well purging for individual wells no later than 90 days prior to scheduled sampling activities."

Because passive sampling is not discussed in the RCRA Permit (NMED, 2010), it was performed in accordance with the methods described in the Work Plan for the Bulk Fuels Facility Expansion of the Dissolved-Phase Plume Groundwater Treatment System Design Revision 2 (Kirtland AFB, 2017b). These methods consisted of:

- Samplers donned new sampling gloves at each well before beginning sampling.
- Deploying passive samplers prior to sampling on a timeline in accordance with manufacturer and analyte-specific requirements to allow for adequate equilibration between the passive sampler and the groundwater. Deployments used dedicated passive deployment equipment, including tethers.
- If the top of water measured was within the screened interval, the midpoint of the uppermost passive sampler was set 2 ft below the water level. If the top of the water was above the screened interval, the midpoint of the topmost passive sampler was set 2 ft below the top of the screened interval.
- Retrieving passive samplers from the wells and collecting the groundwater samples per the manufacturer's specifications. The required sample aliquots were collected from their respective passive samplers. Samples collected for metals analysis using passive methods were filtered directly into proper containers using new, disposable, clean 0.45-micron nominal pore size filters.
- Dedicated deployable equipment was either retained in sealed, non-reactive containers or was stored down well between sampling events.

B-1.3.1.1 Equipment Used

Passive sampling was conducted using dual membrane samplers (DMSs) attached to a tether dedicated to the individual well. Each tether was equipped with a series of rings that the DMSs were attached to beginning at the top of screen depth and continuing every 2.6 ft, with the lowest ring positioned 2.6 ft above the bottom of the screen. Interface probes and PIDs were also used during passive sampling.

B-1.3.1.2 Methods

Deployment

Each DMS was deployed a minimum of 3 weeks prior the planned sampling date. If the screened interval of the well was partially submerged or submerged by less than 5 ft, the depth to water was measured using an interface probe. The number of DMSs deployed in each well was based on the water volume needed for the required samples. Each sampler was filled with deionized water and attached to a ring on the sampler. The DMSs were deployed within the screened interval of each well and below the water table to ensure that they were fully submerged and within the well screen. The tether was secured to the well cap, and the well and well vault were sealed until sampling.

Sampling

As the tether was reeled up, each DMS was removed from the well and the contents were decanted into the required laboratory supplied sample bottles. Sample bottles were immediately placed on ice pending shipping. After sample bottles were filled, any remaining water was transferred into the required storage container and was held in the appropriate investigation-derived waste (IDW) yard pending disposal or analysis, based on the historical analytical results from the GWM well. If it was not redeployed, the dedicated tether was placed in a labeled, protective bag for storage until the next sampling event.

B-1.3.2 LOW-FLOW SAMPLING

Low-flow purging and sampling was conducted in accordance with the requirements of Parts 6.5.17.4 and 6.5.17.5 of the RCRA Permit (NMED, 2010) and approved work plans (Section B-1.1). Low-flow sampling was conducted using either portable or dedicated pumps. If dedicated Bennett pumps fail, they will not be replaced. Instead, the well will be sampled using a portable pump.

Low-flow sampling was conducted in order of clean to increasing contamination based on historical analytical data. When portable low-flow pumps were used, separate pumps were used to sample clean wells versus intermediate or expected hazardous wells in order to decrease the possibility of cross-contamination.

B-1.3.2.1 Instruments and Equipment Used

Low-flow sampling was conducted using either a portable or dedicated Bennett pump. Interface probes, PIDs, multiparameter meters with a flow-through cell attached, and turbidity meters were also used during low-flow sampling. Wells without a dedicated pump were designated, based on historical analytical data, as either clean, intermediate, or expected hazardous. Decontaminated, non-dedicated tubing and portable low-flow pumps were used to sample wells designated as clean, with the sampling assembly decontaminated following use at each well. Dedicated tubing specific to a given well was used for wells designated as intermediate or expected hazardous.

B-1.3.2.2 Methods

Where a portable pump was required, the pump was lowered into the GWM well to a depth of approximately 2 ft below the top of screen for wells where the screened interval was fully submerged. Where the screened interval was partially submerged, the pump intake was placed approximately 2 ft above the bottom of the screen.

Monitoring wells were purged in accordance with the requirements of Part 6.5.17.4 of the RCRA Permit (NMED, 2010) and the approved work plans (Section B-1.1). Groundwater was purged continuously at a flow rate between 0.5 and 1 liter per minute, while field parameters (turbidity, temperature, DO, specific conductivity, pH, and ORP) was measured and recorded every 5 minutes. Purging was considered complete when the groundwater quality parameters stabilized for three consecutive readings. Stability was defined as measurements within 10% of each other for specific conductivity, DO, and temperature; within 0.5 standard units for pH; and turbidity is either below 10 nephelometric turbidity units or measurements within 10% of each other. This was a variance from the RCRA Permit, which stipulates that 75 percent of a well volume be purged from the well prior to sampling. This variance was presented in the Work Plan for the Bulk Fuels Facility Expansion of the Dissolved-Phase Plume Groundwater Treatment System Design (Kirtland AFB, 2017b), which was approved by NMED on May 31, 2017 (NMED, 2017b). The approval meets the requirement in Part 6.5.17.4 of the RCRA Permit (NMED, 2010) that states, "The Permittee may submit to the department for approval, a written request for a variance from the described method of well purging for individual wells no later than 90 days prior to scheduled sampling activities." Purge information and field parameters were recorded on the field forms.

Where a dedicated sampling pump was present, an air compressor and tubing for the purge water was connected to the dedicated equipment. The pump intake was approximately in the middle of the screened interval in wells with dedicated pumps. Note that there are no dedicated pumps in wells with partially submerged screened intervals.

Wells sampled using a portable low-flow system were designated, based on historical analytical data, as either clean, intermediate, or hazardous. Decontaminated non-dedicated tubing and portable low-flow pumps were used to sample wells designated as clean. Dedicated tubing specific to a given well was used for wells designated as intermediate or hazardous. The following procedures applied when sampling wells using a portable low-flow system:

- Samplers donned new sampling gloves at each well before beginning sampling.
- Prior to deployment, the pump and the associated tubing was decontaminated, or dedicated tubing was used.
- An equipment blank was collected from non-dedicated equipment with the frequency specified in Part 6.5.17.6 of the RCRA Permit (NMED, 2010).
- If the top of water measured during the preparation for purging was within the screened interval, the pump intake was set 2 ft below the water table. If the top of the water was above the screened interval, the pump intake was set 2 ft above the bottom of the screened interval.
- The entire sampling assembly was decontaminated following use at each well.

The water sample containers were filled in accordance with the Quality Assurance Project Plan (QAPP). Samples for VOC analysis were collected first. The sample vials were carefully filled to avoid overflow and potential loss of preservative, and gently tapped so entrapment of air was minimized and no head space exists. If bubbles appeared, the vial was refilled or a new vial was used if a sample preservative (e.g., hydrochloric acid) was present.

B-1.4 WATER SUPPLY WELL SAMPLING

Three drinking water supply wells were sampled monthly as part of the ST-106/SS-111 investigation to confirm that they have not been impacted by groundwater contaminants. These wells included ST106-VA2 on Veterans Affairs Medical Center property, KAFB-003, and KAFB-015 on Kirtland AFB property. Well KAFB-016 (also on Kirtland AFB property) was not sampled in May or June as it was down for maintenance.

B-1.4.1 INSTRUMENTS USED

Drinking water sampling was conducted using a multiparameter meter with a sample cup and a turbidity meter.

B-1.4.2 METHODS

Because the wells were actively producing water during sampling, water levels at these wells were not measured prior to sampling. In addition, one well volume was not purged prior to sampling. Sampling at the drinking water supply wells was performed in accordance with the following steps:

Step 1. A water quality instrument(s) was used to collect field readings for DO, pH, ORP, conductivity, turbidity, and temperature during sampling. The multi-parameter instrument was calibrated per the manufacturer's instructions for DO, pH, ORP, conductivity, and turbidity. The readings were recorded in a calibration log.

Step 2. The multi-parameter instrument was decontaminated before use at each water supply well location.

Step 3. A bucket was placed underneath the sample port at the wellhead and the sample port was opened. Any water in the sample port was purged for 30 seconds to ensure removal of potentially accumulated sediment.

Step 4. The sample cups were filled from the sample port for the water quality instruments(s) to take a baseline reading of DO, pH, ORP, conductivity, turbidity, and temperature. These parameters were recorded on the sample collection log.

Step 5. The water sample containers were filled in accordance with requirements of the Quality Assurance Project Plan (QAPP). Samples for VOC analysis were collected first. The sample bottles were carefully filled to avoid overflow and potential loss of preservative, and tapped so entrapment of air was minimized and no head space exists. If bubbles appeared, the vial was refilled or a new vial was used if a sample preservative (e.g., hydrochloric acid) was present.

B-1.5 GROUNDWATER TREATMENT SYSTEM

The GWTS was sampled in accordance with the requirements in the Class V Underground Injection Well Discharge Permit No. 1839 (NMED, 2017b).

B-1.5.1 SAMPLING

B-1.5.1.1 Instruments Used

GWTS sampling was conducted using a multiparameter meter with a flow-through cell and a turbidity meter.

B-1.5.1.2 Methods

Samples were collected from their respective sampling ports by opening the port and discharging process water into the sampling containers. The port was opened in such a way that it did not readily cause entraining of air and subsequent off-gassing of the samples and did not cause loss of sample preservatives from sample containers. Waste containers were placed under sampling ports prior to sampling to ensure capture of all process water. Excess water collected in the waste containers were emptied into the GWTS building sump for treatment. GWTS samples were collected from ports located before the influent skid pumps, between the granular activated carbon vessels, and after the effluent skid pumps. Prior to sampling, the port was flushed for a minimum of 1 minute. Field parameters including temperature, specific conductance, pH, ORP, DO, and turbidity were measured using a multiparameter meter with a flow-through cell and a turbidity meter. Values were recorded on a sample collected log as a snapshot of water quality at the time of sampling.

Field filtering for dissolved metals was performed by affixing a clean piece of poly tubing onto the sampling port. The inline 0.45-micron field filter was attached to the open end of the poly tubing. The port was then be opened so as to condition the poly tubing and filter with process water for approximately 30 seconds. Samples were then collected from the process water flowing through the filter. All process water not collected in the sample container was collected into an appropriate waste container and was discharged to the GWTS building sump for treatment.

After purging was completed, samples were collected and handled in accordance with Part 6.5.5 of the RCRA Permit (NMED, 2010). The required sampling containers were filled and placed on ice pending shipping.

B-1.5.2 EXTRACTION WELL DISINFECTION

B-1.5.2.1 Methods

Extraction wells were not disinfected in the second quarter of 2021. The general procedure for disinfection is discussed below.

If extraction wells are disinfected during a quarter, a pre-disinfection sample will be taken before disinfection occurs. Sodium hypochlorite solution will be added to 500 gallons of water to provide a concentration of at least 50 ppmv free chlorine when added to an extraction well. The extraction well will be shut down, and the diluted sodium hypochlorite solution will be gravity-fed down the well. The extraction well is kept offline for approximately 24 hours. The well is then turned back online and then the water is pumped down through the conveyance line to the GWTS. This water is discharged to an external sump, bypassing the carbon canisters, where any remaining free chlorine in the well water is allowed to evaporate. A post-disinfection sample will be taken after pumping the well free of remaining

free chlorine. Pre- and post-disinfection samples are collected from a sample port in the well vault. Prior to sampling, the pump will run for a minimum of 30 minutes and the sample ports are open for a minimum of 10 seconds to flush any entrained sediment. Samples are analyzed for chlorite, bromate, and perchlorate.

B-1.6 SAMPLE HANDLING, SHIPPING, AND CUSTODY

Sample handling, shipping, and custody requirements were designed to maintain sample integrity from the time a sample is collected until it is received at the analytical laboratory. Samples were handled and shipped in accordance with Part 6.5.5 of the RCRA Permit (NMED, 2010) and approved work plans (Section B-1.1).

B-1.6.1 SAMPLE HANDLING

Samples were handled in accordance with the requirements in Part 6.5.5.1 of the RCRA Permit (NMED, 2010). The procedures below were followed:

- Protective gloves, such as nitrile gloves, were worn while collecting samples. New disposable gloves were worn for each sample.
- Samples were collected in new laboratory-provided glass or plasticware containing the required preservatives for the analytical method.
- Samples were immediately placed on ice where required by the analytical method.
- Sample labels were completed and applied, field documentation was completed, and sample custody was maintained.
- Samples were placed in appropriate protective bags (i.e., bubble bags) to prevent breakage or puncture during shipping.

B-1.6.2 SAMPLE SHIPMENT

Sample packing and shipping was conducted in accordance with the requirements in Part 6.5.5.2 of the RCRA Permit (NMED, 2010). Specific procedures for packaging and shipping of environmental samples are presented below:

- New disposable nitrile gloves were worn when preparing samples for shipping.
- A sample label, completed with indelible ink, was attached to the sample bottle.
- A cooler was used as a shipping container.
- In preparation for shipping samples, the drain plug was taped shut so that no fluids (i.e., melted ice) could drain out of the cooler during shipment. A large plastic bag was used as a liner for the cooler. Packing material (i.e., bubble wrap) was placed in the bottom of the liner and ice was placed at the bottom of the cooler.
- The containers were placed in the lined cooler. Cardboard separators or bubble wrap were placed between the containers at the discretion of the shipper.
- All samples for chemical analysis must be shipped cooled to ≤6 degrees Celsius with ice. All samples required icing before shipment. A temperature blank was included in each shipment of water samples.

- The liner was taped closed, if used, and sufficient packing material was used to prevent sample containers from making contact or rolling around during shipment.

- The chain-of-custody form, including the analytical request form, was placed inside a resealable plastic bag inside of the cooler.

- The cooler was closed and taped shut with packing tape.

- Custody seals were placed on the cooler. Clear tape was placed over the custody seals to help prevent them from being accidentally torn or ripped off.

- The cooler of samples were submitted to the laboratory in an appropriate timeframe based on the hold time and temperature requirements (i.e., shipped via an overnight carrier). A copy of the shipping bill was retained for the field records and sent electronically to the project chemist.

B-1.6.3 SAMPLE CUSTODY

Sample custody was maintained in accordance with the requirements in Part 6.5.5.3 of the RCRA Permit (NMED, 2010). Samples collected for analysis were recorded on field sample collection logs and chain-of-custody forms. Chain-of-custody forms were placed in the cooler or other shipping container. Custody seals were applied to the cooler or other shipping container. Upon receipt of the samples at the laboratory, custody seals were broken, the chain-of-custody forms were signed as received by laboratory personnel, and the conditions of the samples were recorded on the form. Chain-of-custody form copies were returned, which Kirtland AFB maintains.

At a minimum, chain-of-custody forms included the following:

- Sample Identification number
- Signature of sample collector
- Date and time of sample collection
- Location at which the sample was collected
- Type of media sampled
- Preservatives used
- Analysis required
- Signature of all persons that had custody of the samples
- Dates and times of possession
- Signature, date, and time of breaking the custody seal by the laboratory

B-1.6.4 SAMPLE LABELS

Sample labels were prepared in accordance with the requirements in Part 6.5.5.4 of the RCRA Permit (NMED, 2010). Labels were affixed to each sample container and were completed immediately following sampling using indelible ink. Labels were covered by transparent waterproof tape to maintain legibility. At a minimum, labels included the following:

- Sample identification number
- Name or initials of sample collector
- Sample location
- Sample date and time
- Analytical parameter and method requested
- Preservation method

B-1.7 PURGE AND DECONTAMINATION WATER MANAGEMENT AND DISPOSAL

Purge and decontamination water was managed and disposed of in accordance with the requirements in Part 6.5.7 of the RCRA Permit (NMED, 2010). Prior to GWM sampling for the quarter, historical data from each monitoring well was evaluated to determine how purge or well maintenance water was initially managed. IDW purge water was managed in one of three categories: (1) non-hazardous water that meets GWTS discharge criteria, (2) non-hazardous water that requires evaluation/approval prior to discharge to the GWTS, and (3) hazardous or suspected hazardous water managed as hazardous waste. In addition, ancillary fluids (i.e., decontamination water and calibration fluids) were managed and, if appropriate, discharged at the GWTS after review/approval of analytical data.

B-1.7.1 NON-HAZARDOUS PURGE WATER MANAGEMENT

Non-hazardous IDW purge water collected during sampling of the GWM wells was placed in 55-gallon poly drums. The drums were sealed with matching plastic lids with steel, locking-ring collars, labeled with vinyl non-hazardous waste labels, and were transferred to the designated non-hazardous IDW yard located on Kirtland AFB. Small volumes of IDW water, typically generated from the sampling of passive sampling devices or sampling of drinking water wells, were placed in labeled, 5-gallon plastic buckets (pails) with sealing lids.

Eligibility for discharge of non-hazardous liquid IDW to the GWTS was determined by comparing historical, well-specific data from the previous two quarters to the acceptance criteria of the GWTS. Liquid IDW from monitoring wells that had historically met the GWTS acceptance criteria was placed on an Auto-Approval List that authorizes discharge to the facility without further review. Any liquid IDW on the Auto-Approval List that was collected, but not yet processed through the GWTS, was temporarily held in the "Pending Disposal" area of the IDW yard.

Liquid IDW sourced from wells with historical data from the previous two quarters that exceeded the GWTS acceptance criteria was held for further evaluation in the "Pending Analysis" area of the IDW yard. Upon receipt of the laboratory analytical data for each well, the data were evaluated against GWTS acceptance criteria. If the data were within GWTS acceptance criteria, the purge water was approved for GWTS discharge. If the data indicated that one or more constituents were outside GWTS parameters, the purge water was processed for offsite disposal at a permitted facility.

B-1.7.2 HAZARDOUS PURGE WATER MANAGEMENT

All liquid hazardous waste (purge or well development water) was placed in 55-gallon steel drums with steel tops and locking rings (UN designation 1A2/Y1.2/100/**). When small volumes (less than 5 gallons) of waste were generated at a well, a plastic container with a threaded top (jerrican) was used to contain the liquid. The jerrican was then placed in a steel, 55-gallon drum for more secure storage. All waste containers were properly labeled, sealed, and placed on secondary containment pallets located within the appropriate less than 90-day accumulation area. The accumulation areas and waste containers were inspected on a weekly basis by trained personnel as required under 40 Code of Federal Regulations (CFR) 262.34.

Hazardous or suspected hazardous IDW was accumulated in one of two RCRA less than 90-day accumulation areas associated with the Kirtland AFB Bulk Fuels Facility Project. Hazardous waste generated from routine GWM sampling or well maintenance activities (purge, well development, or well rehabilitation water) was placed in the Kirtland AFB Bulk Fuels Facility RCRA less than 90-day

accumulation area. Hazardous or suspected hazardous waste generated during drilling activities was held in the Kirtland AFB Zia Park temporary RCRA less than 90-day accumulation area.

Prior to the start of each quarterly GWM sampling event, a preliminary evaluation was made to identify monitoring wells that were anticipated to generate characteristically hazardous liquid IDW for initial waste segregation purposes. Based on historical analytical data available for each well, the water was suspected to be characteristically hazardous if the concentration of benzene exceeded 500 micrograms per liter (per 40 CFR Part 261.24) in either of the previous two sampling events. Liquid IDW from these wells was managed as a potentially characteristically hazardous waste pending confirmation from laboratory analytical results.

For monitoring wells located in the source area of the groundwater plume that have historically shown consistent data that indicate purge water was hazardous, "Generator Knowledge" was used for hazardous waste determination. Use of generator knowledge to determine if solid waste is hazardous is permitted under RCRA regulation 40 CFR 262.11(d)(1).

Upon receipt of analytical data, the IDW remained in the less than 90-day accumulation area if confirmed to be a hazardous waste. If the IDW was determined to not meet hazardous criteria based on analytical data, the non-hazardous waste was transferred to the "Pending Disposal" area of the non-hazardous IDW yard.

All hazardous waste was removed from Kirtland AFB and properly disposed of off-Base within the required 90-day accumulation time limit. Hazardous waste was transported off Kirtland AFB after it was properly profiled, manifested, and approved for transport by the Kirtland AFB Hazardous Waste Management Group. Waste was transported by a licensed hazardous waste hauler to a permitted treatment, storage, and disposal facility.

B-1.8 SOIL VAPOR SAMPLING

Soil vapor sampling was conducted in accordance with the requirements in Part 6.5.16 of the RCRA Permit (NMED, 2010) and the approved Work Plan for Vadose Zone Coring, Vapor Monitoring, and Water Supply Sampling Revision 1 (Kirtland AFB, 2017a).

B-1.8.1 EQUIPMENT

Soil vapor samples were collected in Summa® canisters provided by the analytical laboratory; each canister had a unique regulator. A sample train consisting of 0.5-inch fluorinated ethylene propylene tubing and a four-way stainless steel Swagelok cross equipped with quick connects was used in coordination with a Horiba Mexa-584L (Horiba) emissions analyzer and a Gast rotary vane pump to purge the well, measure field parameters, and collect the soil vapor sample.

At the beginning of each workday, the Horiba was calibrated for air-phase petroleum hydrocarbons (HC) and carbon dioxide (CO_2) against known calibration standards and for oxygen (O_2) against atmospheric conditions. At the middle of each workday (or no more than 5 hours after the start of work), a calibration check was performed on the Horiba to determine whether the calibration of any of the parameters had drifted since the morning calibration. If the calibration check results were outside of 5% of the calibration gas standards, then the Horiba was recalibrated prior to additional sampling. If at any point during sampling, a reading for HC, CO_2, or O_2 reaches an unreasonable value (e.g., an O_2 concentration greater than 22%) or if a data value was outside the trend indicated by previous readings at a given location, a calibration check was performed. The expected range of values are from 0 to 40,000 ppmv for HC, from 0% to 15% for percent CO_2, and from 0% to 22% for percent O_2. If any readings were outside of these ranges, a calibration check was completed and, if necessary, the instrument was recalibrated. The sampling system must be purged with ambient air before being attached to a soil vapor monitoring point (SVMP) sample port to minimize potential cross-contamination between samples. To ensure the entire sample train was thoroughly purged, the pump was attached to the setup and atmospheric air was flushed through the quick connect port and the nylon tubing. All fittings are to be opened during this process to allow for flow. The purging effectiveness was monitored using the Horiba to ensure no contaminants remained and that only ambient air was being read. Correct values for ambient air must be less than 5 ppmv HC, 0% for percent CO_2, and between 20% to 22% for percent O_2. Complete instrument purging must be performed after sampling each SVMP. A digital manometer was used to gauge pressure in the well, and a PID was used to ensure a safe working environment. The digital manometer does not require field calibration.

At the beginning of each workday, the sampling system was leak checked using the following steps:

Step 1. The male pneumatic fitting on the end of the nylon tubing was capped with a spare female quick disconnect fitted to a vacuum/pressure gauge.

Step 2. The SVMP purging/sampling pump was connected to one of the quick disconnect fittings on the sample system and the air was evacuated from the sample system to establish a vacuum.

Step 3. The pump was disconnected and the vacuum reading was immediately recorded from the pressure/vacuum gauge.

Step 4. After 10 minutes elapsed, the vacuum reading on the gauge was checked and recorded.

Step 5. The starting and ending vacuum readings were verified to within 10% to ensure that the sampling system was not leaking.

Step 6. If the two vacuum readings were not within 10% of each other, the conditions of the seals were checked and the leak test was repeated until the sampling system was confirmed to be airtight.

B-1.8.2 METHODS

B-1.8.2.1 Static Pressure Measurement

Before taking the static pressure reading, the manometer instrument must be zeroed to atmospheric pressure. The screen should read 0.00 inches of water column (in. WC). After confirming that the manometer was zeroed, the following procedure was used to connect the sampling system to the SVMPs and measure the static (also called baseline) pressure, to assure readiness for purging and sampling:

Step 1. The manometer was connected to the side of the sampling system opposite of the Summa® sample collection port.

Step 2. A manometer reading of 0.00 in. WC was verified.

Step 3. Nylon tubing was connected to the SVMP and a secure connection was ensured.

Step 4. The change in manometer readings was monitored over time and the pressure/vacuum reading was recorded when the meter stabilized.

B-1.8.2.2 Purging Soil Vapor

Stagnant soil vapor was purged from the SVMP as follows:

Step 1. The SVMP sampling pump was turned on, the operation of the flow rotameter was verified, and potential leaks were identified if present.

Step 2. The Purge Table (Table 1 of the Soil Vapor Monitoring Standard Operating Procedure) was consulted for the initial purge volume.

Step 3. The female quick disconnect on the terminal end of the sampling system was connected to the male quick connect on the vacuum side of the soil vapor monitoring sampling pump and timing the purge cycle began. (Note: The flow rate on the rotameter was used along with the precalculated purge volume to quickly calculate the purge time. The purge time was determined by the well port diameter, well depth, and rate of the pump; all of which were known before sampling with the exception of the flowrate. The amount of vapor needed to be removed was based on one well casing volume).

Step 4. After adequately purging for the appropriate time, the sampling system was quickly disconnected from the vacuum pump. (Note: The sampling system remained connected to the SVMP for the duration of sampling).

Step 5. The manometer reading was allowed to return to within 0.10 in. WC of the static pressure reading before moving to the next step in the sampling procedure.

B-1.8.2.3 Horiba Readings

Once the SVMP had been purged, the following procedure was used to take and record HC, CO_2, and O_2 measurements using the calibrated Horiba:

Step l. Ensured that the Horiba was turned on and was functioning properly.

Step 2. Recorded the manometer reading.

Step 3. Inserted the male quick connect fitting into the female quick connect fitting on the terminal side of the sampling system and ensured a tight connection.

Step 4. Observed the Horiba O_2 reading for stability or for a maximum of one minute, whichever came first.

Step 5. Recorded the HC, CO_2, and O_2 readings and quickly disconnected the Horiba. Photographed the Horiba reading for quality control reference, and included the well number in the picture.

B-1.8.2.4 Soil Vapor Sampling

The following procedures were used when collecting soil vapor samples for laboratory analysis:

Step 1. The vacuum in the Summa® canister was checked prior to sampling by taking a vacuum reading using a lab-supplied vacuum gauge or equivalent.

- Confirmed that the valve was closed.
- Removed the brass cap.
- Attached the gauge. Made sure that the gauge was not cross thread onto the canister. The gauge was snug with no apparent rattles prior to collecting the initial vacuum reading.
- Attached the brass cap to the side of the gauge tee fitting to ensure a closed train.
- Quickly opened and closed the valve (a few seconds).
- Read the vacuum on the gauge. (Note: canisters are required to be within --25 to -29.9 inches of mercury of vacuum. If the measured vacuum was outside of this tolerance, the canister was not used for sample collection).
- Recorded the initial vacuum reading on the chain-of-custody, verified that the valve was closed, and removed the gauge.
- Replaced the brass cap.

Step 2. With the nylon tubing still connected to the well port, the static pressure indicated on the manometer read-out was recorded.

Step 3. The Summa® canister was connected to the connection on the sample system.

- Confirmed that the valve was closed.
- Removed the brass cap.
- Attached the particulate filter.
- Connected the Summa® canister to the connection on the sampling system.

- Opened the valve ½ turn to fill the canister.
- Disconnected the Summa® canister after two minutes or once the manometer read -5 inches of mercury, whichever came first (Note: it is the intent to leave some vacuum in the canister for the laboratory to determine sample integrity upon receiving samples).
- Closed the valve by hand tightening knob clockwise.
- Repeated Step 1 to determine vacuum/pressure.
- Replaced the brass cap.

B-1.8.3 SAMPLE PACKAGING AND SHIPPING

Sample packaging and shipping requirements were designed to maintain sample integrity from the time a sample is collected until it is received at the analytical laboratory. All chain-of-custody forms, sample tags, custody seals, and other sample documents were completed as specified in the QAPP. Specific procedures for packaging and shipping of environmental samples are presented below:

- A sample tag, completed with indelible ink, was attached to the canister.
- The filled Summa® canisters were placed in the cardboard box in which the canisters were received from the laboratory. The sample number was written on the top of the box. Each individual box was boxed in groups of four or eight in the larger boxes in which they were shipped.
- A copy of the chain-of-custody form was placed inside the box.
- The box was closed and taped shut with strapping tape (filament-type).
- Custody seals were placed on the box. Clear tape was placed over the custody seals to help prevent them from being accidentally torn or ripped off.
- The box of samples was shipped via FedEx ground. A copy of the shipping bill was retained for the field records and was sent electronically to the project chemist.

B-3-1. EXPLANATION OF REFERENCE ELEVATION INTERVAL DESIGNATIONS

The following text was initially provided in the Fourth Quarter (Q4) 2016 Quarterly and Annual Report (Kirtland Air Force Base [AFB], 2017a):

> In previous reports, the distribution of groundwater contamination had been described in terms of shallow, intermediate, and deep intervals within the ethylene dibromide (EDB) plume. These intervals were broadly defined by permeable zones in which EDB migration had been identified, and these intervals have been used to guide the vertical design of monitoring wells. However, with the implementation of the groundwater treatment system (GWTS) interim measure north of Ridgecrest Drive, Southeast (SE), combined with the anticipated continuing water table rebound of approximately 2 feet per year for the next decade, these definitions of shallow, intermediate, and deep become problematic. Not all contamination will move upward with the rising water table; therefore, the base of the deep zone is expected to remain somewhat fixed. In addition, as the water table rises, the plume is expected to increase in thickness over time and impact a shallower layer of the aquifer that is not present today. For these reasons, the continued use of shallow, intermediate, and deep nomenclature will be inadequate to accurately describe changing vertical plume concentrations and changes in the plume related to the GWTS operation.

To assess performance of the GWTS, particularly regarding plume capture and plume collapse, several methods of analysis that compare variations in groundwater flow paths and contaminant concentration trends will be employed both horizontally and vertically. Horizontally, visualizing how concentrations vary in map view, from upgradient to downgradient, around Bullhead Park and the Veterans Affairs (VA) Medical Center, has not changed as these features are fixed. However, in the vertical dimension, shallow, intermediate, and deep are changing with time and are not fixed. Therefore, to fix these layers to accommodate consistent performance analysis in the vertical dimension, and to provide for future addition of new layers (i.e., a shallower zone) as the water table rises, the concept of reference elevation interval (REI) is introduced in this report. In concept, what were once the deep, intermediate, or shallow zones will now be represented as layers in a cake (e.g., with a bottom elevation and a top elevation). Because of the nature of the permeable zones, the bottom and top undulate somewhat rather than being perfectly flat; however, the plume can still be visualized in terms of these layers. As the water table rises, layers can be added to the top. Because these fixed layers are defined, vertical water levels and vertical contaminant concentrations can be compared over time and always to the same references. This will allow meaningful analysis of trends that demonstrate plume capture and collapse with consistent reference points. The three REIs are 4857, 4838, and 4814, corresponding to the historically identified shallow, intermediate, and deep zones, respectively. Table 3-4 includes the REI assignations for the groundwater monitoring (GWM) network.

The association of the former groundwater zones and REIs relative to the depth of well screen intervals within the GWM network is summarized below:

- ***REI 4857*** is currently the uppermost interval so named because the GWM wells comprising this dataset are screened across the elevation of 4,857 feet above mean sea level (amsl). Data collected or measured from these GWM wells are representative of the hydrogeologic conditions of this zone that is bounded on top by the water table surface and bounded on the bottom by a surface that intercepts the bottom of the REI 4857 well screens. The screen elevations for the GWM wells within this dataset range from 4,879 feet amsl down to 4,827 feet amsl, and include all wells formerly categorized as shallow and two new GWM wells completed in December 2016 (KAFB-106235-463 and KAFB-106236-461). These two new wells were not sampled in Q4 2016. A total of 62 wells comprise this dataset, 8 of which are included in both the REI 4857 and

REI 4838 datasets: KAFB-106001, KAFB-106015, KAFB-106017, KAFB-106018, KAFB-106019, KAFB-106021, KAFB-106022, and KAFB-106025. The reason for this double assignation is due to well screen construction lengths (25-30 feet) and thus overlapping screen intervals in REI 4838 by more than 5 feet. This means that samples collected from these 8 wells are representative of REI 4857 and are also representative of at least one-third of REI 4838. Of note, a majority of the REI 4857 wells were designed to be water table wells with partially submerged screens, having relatively long screen lengths ranging from 20 to 30 feet. However, due to rising groundwater elevations, only 14 GWM wells included in REI 4857 remained with partially submerged screens as of Q4 2016.

- ***REI 4838*** directly underlies REI 4857 and is so named because all but one of the screens of the GWM wells comprising this dataset are screened across the elevation of 4,838 feet amsl. Data collected or measured from these GWM wells are representative of the hydrogeologic conditions of this zone that is bounded on top by the bottom surface of REI 4857 and bounded on the bottom by a surface that intercepts the mid-point between the REI 4838 screens and the underlying REI 4814 screens. The screen elevations for the GWM wells within this dataset range from 4,848 feet amsl down to 4,800 feet amsl and include all but two of the wells previously categorized as intermediate; the exceptions are GWM wells KAFB-106230 and KAFB-106232, which are now included in the REI 4814 dataset due to the depth of their screens. Eight wells are included in both in REI 4857 and REI 4838 datasets, as discussed above. The REI 4838 GWM well dataset contains one anomalous well assignment (KAFB-106037). This well, having a screened elevation between 4,815 and 4,800 feet amsl, was previously assigned as a deep well. However, it is part of the only clustered well group having four wells (all other have either two or three). Having three REIs meant excluding one well from this system in the capture analyses. KAFB-106037 was chosen over KAFB-106036 because analysis of historical groundwater level measurements from this clustered well group showed that it was in better communication with the nearby interim measure extraction well KAFB-106228. KAFB-106037 was placed in REI 4838 because the deepest well in the clustered well group (KAFB-106212) is screened below extraction well KAFB-106228, which necessitated its inclusion in the underlying REI 4814. A total of 46 GWM wells are included in REI 4838.

- ***REI 4814*** directly underlies REI 4838 and currently represents the lowest elevation dataset. This dataset includes all but one well (KAFB-106037) previously designated as deep, as well as the two previously designated intermediate wells (KAFB-106230 and KAFB-106232), as described above. The screened intervals for GWM wells within this dataset cover a large vertical extent of the aquifer ranging from an elevation of 4,824 feet amsl down to an elevation of 4,720 feet amsl. Not all of the screened intervals overlap, prohibiting the assignment of a reference elevation common to all wells. There are 16 wells with screen elevations ranging from 4,824 to 4,798 feet amsl, while 20 well screens fall within the 4,781- TO 4,753 feet amsl range, and 3 well screens from 4,740- to 4,720 feet amsl. A reference elevation of 4,814 feet amsl was chosen as an identifier for this interval because it passes through the screens of the uppermost group of wells in the dataset allowing for the addition of a deeper REI if required in the future. Data collected or measured from these GWM wells are representative of the hydrogeologic conditions of this zone that is bounded on top by the bottom surface of REI 4838 and bounded on the bottom by a surface that intercepts the bottom of the REI 4814 well screens. There are 39 GWM wells installed in REI 4814.

B-3-2. DISCUSSION OF FIELD PARAMETERS FROM PASSIVE SAMPLING

The following text was initially provided in the Second Quarter (Q2) 2017 Quarterly Report (Kirtland AFB, 2017b):

Upon initiating the Q2 2017 passive sampling, field parameter measurements were notably skewed from historical measurements. Following the collection of field parameters from 13 GWM well locations with passive samplers, it was apparent that field parameter data collected from the passive samplers were not representative of the groundwater conditions due to the pore diameter of the passive sampling membranes, and continued collection of field parameters from passive samplers was terminated pending discussion with the New Mexico Environment Department. Therefore, field parameters were only collected from wells that utilized low-flow sampling techniques (all located south of Gibson Boulevard SE).

B-3-3. PASSIVE SAMPLER EVALUATION

The following text was initially provided in the Q4 2017 Quarterly and Annual Report (Kirtland AFB, 2018a):

A demonstration was performed in Q4 2017 to assess a proposed transition from collecting grab samples using a low-flow methodology (Bennett pump sampling systems) to a passive sampling technique (i.e., dual-membrane sampler [DMS]). This demonstration consisted of comparing low-flow sample analytical results and passive sample analytical results for EDB; benzene, toluene, ethylbenzene, and total xylenes (BTEX); and inorganic compounds from groundwater samples collected from five source area wells (Figure E-7-1). The results are reported in Table 3-14 and shown on Figure 3-23.

In addition, field parameters were compared between the low-flow purge water using a YSI Pro Plus multiparameter probe with a flow-through cell, and measurements taken *in situ* within the well using an Aqua TROLL® 600 multiparameter sonde deployed within the well screen depth (Table 3-15). If passive sampling is approved for source area wells, reliable field parameter measurements will not be achieved from the DMSs and, therefore, an *in situ* method may be proposed if continued field parameter collection is necessary.

The analytical results from this demonstration are summarized below. In accordance with the work plan (Kirtland AFB, 2017c), the low-flow sample data are used for reporting purposes. The sample results from the DMSs are only used for demonstration purposes, and a relative percent difference (RPD) was calculated for each analyte within each sample (Table 3-14). The approved Quality Assurance Project Plan acceptable RPD for duplicate groundwater samples is 35 percent (%) for analytical results and was, therefore, used herein to determine a comparable threshold value. The RPD acceptance threshold of 35% is relevant when comparing two samples utilizing the same sampling methodology. A comparison of results collected via two different sampling methods, one discrete (DMS) and one indiscrete (Bennett pump), may result in widely varying RPDs. The 35% threshold has been selected to illustrate that the two methods provide results that are comparable to two samples obtained using the same sampling methodology. Analytical results and RPDs are summarized below:

- EDB was detected in all groundwater samples collected using both low-flow and passive technologies. The RPD for EDB from samples collected from KAFB-106005 was 10%. The EDB concentrations from the other four wells in the demonstration ranged from 0.85 to 5.9 micrograms per liter (µg/L), with RPDs ranging from 48 to 175%; above the acceptable 35% RPD.

- Benzene was detected in all groundwater samples (at concentrations above the project screening limit [PSL] of 5 µg/L) using both low-flow and passive technologies. The RPD for the benzene results was 0% for KAFB-106008 (both methods had a benzene concentration of 2,300 µg/L), and the RPD was relatively low for two other wells (KAFB-106005 and KAFB-106006) at 26 and 31%, respectively. The RPD for benzene from groundwater samples collected from KAFB-106014 and KAFB-106059 was 64 and 121%, respectively; above the acceptable 35% RPD.

- Toluene was detected or estimated in all groundwater samples collected using both low-flow and passive technologies. The RPD for toluene ranged from 16 to 195% and was below the acceptable 35% RPD in two wells (KAFB-106005 and KAFB-106008).

- Ethylbenzene was detected in all groundwater samples collected using both low-flow and passive technologies. The RPD for ethylbenzene was 0% in KAFB-106006 (both methods had an ethylbenzene concentration of 3 µg/L), and the RPD was relatively low for KAFB-106005 (19%).

The ethylbenzene concentrations from the other three wells in the demonstration ranged from 45 to 470 µg/L, with RPDs ranging from 39 to 164%; above the acceptable 35% RPD.

- Total xylenes were detected all groundwater samples collected using both low-flow and passive technologies, with the exception of the DMS sample from KAFB-106006, precluding the ability to calculate an RPD from that well. The RPD for total xylenes was 17% from KAFB-106005, within the 35% RPD. The RPD was above 35% in the remaining wells (KAFB-106008, KAFB-106014, and KAFB-106059).

It should be noted that while some RPD values for EDB and benzene exceeded the 35% threshold, no significant differences in analyte concentrations were observed between either sampling method or the respective analyte PSL. Both methods yielded comparable results that were either both below or above the PSL. The only exception to this were the EDB results from well KAFB-106006. At this well, the low-flow sampling method resulted in an estimated value below the PSL (0.014 µg/L) while the passive sampling method resulted in a value above the PSL (0.21 µg/L). When comparing plume maps utilizing either the passive sampling data or the low-flow sampling data, only minimal shifts of some internal isocontours occur between the two sample types (Figure 3-23); however, the overall contoured boundary (specified as the PSL concentration) generally remained unchanged.

- Inorganic concentrations observed in the groundwater samples collected using the two methods were generally in agreement, with only a few samples that exceeded the 35% RPD, as follows:

  - Dissolved manganese in KAFB-106005 (40% RPD) and KAFB-106014 (46% RPD)
  - Nitrate/nitrite nitrogen in KAFB-106005 (156% RPD) and KAFB-106006 (40% RPD)
  - Dissolved iron in KAFB-106006 (44% RPD)
  - Chloride in KAFB-106014 (80% RPD)

The results from the field parameter demonstration are summarized below. In accordance with the work plan (Kirtland AFB, 2017c), the low-flow purge water data are used for reporting purposes as measured using the YSI Pro Plus. The field parameters from the Aqua TROLL® 600 multiparameter sonde are used for demonstration purposes only, and an RPD was calculated for each parameter within each well (Table 3-15). An RPD of 50% was deemed acceptable for the field parameters and is conservative given the variability and relatively low concentrations of dissolved oxygen (DO) and turbidity. In accordance with the work plan (Kirtland AFB, 2017c), field parameters were collected until stabilization of three consecutive readings within 10% of one another was achieved, or a maximum of 1 hour. The final, stabilized field parameters measurements are used for reporting and demonstration purposes.

- Turbidity had relatively high RPDs with the exception of KAFB-106014 at 20%; the remaining four wells had an RPD for turbidity ranging from 60 to 198%.

- Temperature was consistent between the two methods, with a maximum RPD of 12% (KAFB-106008).

- DO had relatively high RPDs in three wells (KAFB-106005, KAFB-106006, and KAFB-106008). DO had relatively low RPDs in KAFB-106014 (46%) and KAFB-106059 (28%). Although DO had relatively high RPDs in three of the demonstration wells, the results were all <1 milligram per liter (mg/L), with the exception of the low-flow result from KAFB-106006 (2.94 mg/L).

- Specific conductivity was consistent between the two methods, with a maximum RPD of 43% (KAFB-106005).

- pH was consistent between the two methods, with a maximum RPD of 7% (KAFB-106059).

- Oxidation-reduction potential had relatively high RPDs in wells KAFB-106005 and KAFB-106059 at 55 and 54%, respectively. The other wells demonstrated relatively low RPDs for oxidation reduction potential, ranging from 5 to 29%.

These results indicate that passive sampling techniques (i.e., DMSs) generally provide results that are comparable to low-flow techniques for inorganic parameters. For volatile parameters, including EDB and BTEX, the results indicate good agreement between the two methods for relatively lower concentrations (e.g., KAFB-106005 and KAFB-106006); however, the higher concentrations of EDB and BTEX did not provide as comparable results between the two methods (e.g., KAFB-106008, KAFB-106014, and KAFB-106059). Plume delineation in the source area at the PSL for both EDB and benzene was comparable between both methods. Significant differences in concentration contours were only observed at concentrations exceeding the PSL by approximately three orders of magnitude (Figure 3-23). The only exception to the plume boundary was for the EDB PSL contour extending further south around KAFB-106006 due to the higher passive sampler concentration.

Previous demonstrations have shown generally comparable results between the two methods, with no consistent bias identified (i.e., neither method has consistently resulted in higher or lower concentrations). Furthermore, vertical profiles were evaluated in Q4 2016 and first quarter (Q1) 2017 (Kirtland AFB, 2017d) that demonstrated most source area wells that were evaluated did not have significant vertical gradients and, therefore, matching the passive sample depths to the low-flow sample depth, as was done for this demonstration, should not result in a significant sample bias. The two field parameter methods (low-flow purge water versus *in situ* measurements) resulted in agreement between the methods, with turbidity being the parameter with the greatest discrepancies. Temperature, pH, and specific conductivity all revealed consistent measurements between the two methods. Although DO resulted in RPDs greater than 50% in three wells, all results were <1 mg/L with the exception of the low-flow result from KAFB-106006 (2.94 mg/L).

B-3-4. REGIONAL GROUNDWATER GRADIENT

The following text was initially provided in the Q2 2018 Quarterly Report (Kirtland AFB, 2018b):

> The GWM well network for the Kirtland AFB Bulk Fuels Facility (BFF) jet fuel dissolved-phase contamination is screened near the top of the saturated interval of the Santa Fe Group aquifer system. Historically, this aquifer system was the sole water supply for the Albuquerque metropolitan area and the groundwater flow was from north-northeast to south-southwest toward the Rio Grande (Bexfield and Anderholm, 2000). As the population increased, water demand also increased and the Santa Fe aquifer system experienced significant stress resulting in water level declines in excess of 100 feet near Kirtland AFB (Powell and McKean, 2014). Furthermore, the groundwater flow changed direction from south-southwest (toward the Rio Grande) to an easterly and northeasterly direction, away from the Rio Grande and toward the city and its drinking water supply wells (Powell and McKean, 2014). It is important to note the predominant groundwater flow direction, which the dissolved-phase constituents migrated along, was north-northeast. To reduce the use of groundwater while maintaining municipal water supply, in 2008, the Albuquerque Bernalillo County Water Utility Authority began diverting water from the San Juan-Chama Drinking Water Project. As a result, this surface water diversion has relieved the pumping stress of the Santa Fe aquifer system and groundwater levels have been rebounding approximately 3-4 feet per year, with rates varying depending upon the proximity to pumping wellfields or historical groundwater sinks (Beman, 2013). A more detailed discussion of the conceptual site model can be found in Section 7 of the RFI Report (Kirtland AFB, 2018c).

B-3-5. DESCRIPTION OF FORMER WELL DESIGNATIONS AND ASSOCIATED SAMPLING REGIMES

The following text was initially provided in the Q4 2018 Quarterly and Annual Report (Kirtland AFB, 2019):

In previous reports, GWM wells were assigned designations based either on their location related to the groundwater gradient and their spatial relationship to the dissolved-phase EDB or simply on their location (i.e., source area, etc.). However, due to the changing regional groundwater gradient (Section 3), these designations may no longer be appropriate or meaningful. In order to present analytical data and data summaries conveniently at the project scale, all GWM wells will hereafter be designated simply as "groundwater monitoring well," except for newly added wells (which include any newly installed wells), and the presentation of analytical data will be centered on analytes as opposed to former well designations. The former well designations and monitoring well objective are provided in Table 3-1 along with the current sampling regime by quarter. A brief description of the former well designations and the frequency of samples collected by designation is provided below.

Newly Added Wells—Newly added wells include both existing wells that are added to the GWM network as well as newly installed wells that have not completed four quarters of baseline sampling. Newly added GWM wells require a minimum of four consecutive quarters of baseline full-suite analytical sampling before receiving a designation that determines the long-term sampling regime. These wells have been added to define the plume boundary and provide additional water table monitoring due to the rising groundwater elevation.

Source Area Wells—Primarily located in the BFF south of Randolph Road SE and proximal to the spill site on-Base. Sampled during Q2 and Q4. These wells monitor the higher concentrations of dissolved-phase contaminants on-Base.

Downgradient Proximal Wells—Located north of Ridgecrest Drive SE surrounding the historical low concentration dissolved-phase EDB to the west, north, and east into the distal portion of the GWM network. Analytical data for these wells have been historically below the maximum contaminant level for EDB. Sampled every quarter. These wells assist in plume boundary definition.

Veterans Affairs (VA) Proximal Wells—Three sets of nested wells located between the historical dissolved-phase EDB south of Ridgecrest Drive SE and the Raymond G. Murphy VA Medical Center as a means to detect any potential contaminant migration toward the VA medical campus. Sampled every quarter. These wells provide additional wellhead protection monitoring for the VA supply well.

Signal Wells—Three wells located along the south side of Ridgecrest Drive SE to monitor BTEX and provide early indication if theses dissolved-phase constituents are migrating from the source area into the interim measure Target Capture Zone. Sampled during Q2 and Q4.

GWM Wells—Primarily located north of Ridgecrest Drive SE within the historical footprint of the dissolved-phase EDB. Analytical data from these wells serve to define the volume and mass of the dissolved-phase EDB throughout the GWM network. Sampled in Q2 and Q4.

Table 3-4
Groundwater Monitoring Wells Included in Q4 2016 Monitoring Activities

[a] Screen interval is rounded to the nearest foot.
[b] Portable equipment sampling depths are estimated to the nearest half foot due to slight inaccuracies with the mechanism measuring the pump setting in the field
[c] The analytical methods for EDB and VOCs are 8011 and 8260C, respectively. Metals analyses consisted of select total metals (arsenic, calcium, lead, potassium, magnesium, and sodium by analytical method 6020A/6010C and select and dissolved metals (iron and manganese) (6010C). Anions analysis consisted of ammonia by method 4500NH3B/C, bromide by method 300.0A, chloride by method 300.0A, nitrate/nitrite nitrogen by method 353.2, sulfate by method 300.0A, and sulfide by method 4500 S2CF. FP include pH, specific conductivity, dissolved oxygen, oxidation reduction potential, temperature, and turbidity.
[d] Pump setting estimated as half-way between top and bottom of screen.
[e] Due to fuel contamination at the location of well at KAFB-106091, the well was resampled for EDB, benzene, ethylbenzene, toluene, and total xylenes on December 15, 2016
AMSL = above mean sea level
bgs = below ground surface
EDB = ethylene dibromide
FP = field parameter
ft = foot/feet
ID = identification
Q = quarter
VOC = volatile organic compound

Table 3-14
Comparison of Analytical Results between Bennett Pumps and Passive Samplers in Source Area Wells, Q4 2017

[a] Sample aliquots were collected using dual-membrane samplers.

[b] Nondetect results are reported less than the LOD.

[c] RPD is calculated as (A-B) / (A+B/2) X 100 where the Bennett pump result is A and the DMS result is B.

-- = sample not analyzed for this parameter

DMS = dual-membrane sampler

EDB = ethylene dibromide (1,2-dibromoethane)

LOD = limit of detection

LOQ = limit of quantitation

NA = RPD is not calculated if both results are nondetect or if one or both of the results are below the LOQ.

RPD = relative percent difference

VOC = volatile organic compound

Shaded = RPD value exceeds 35 percent field duplicate sample precision criteria (Kirtland AFB Quality Assurance Project Plan for Bulk Fuels Facility Expansion of the Dissolved-Phase Plume Groundwater Treatment System Design Solid Waste Management Unit ST-106/SS-111 (USAF 2016)

Qualifiers:

J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.

U = Qualifier denotes the analyte is not detected above the detection limit.

UJ = The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Table 3-15
Comparison of Analytical Results between YSI and Aqua-Troll Parameter Readings for Source Area Wells, Q4 2017

[a] NMWQCC numeric standards per the NMAC Title 20.6.2.3101A, Standards for Groundwater of 10,000 mg/L Total Dissolved Solids Concentration or Less (NMAC 2004). For metals,

[b] The project screening level was selected to satisfy the requirements of the Kirtland AFB Hazardous Waste Permit Number NM9570024423 as the lowest of (1) NMWQCC numeric standard or (2) EPA MCL. If no NMQWCC standard or MCL exists for any analyte, then the project screening level will be the EPA RSL.

µg/L = microgram per liter
µS/cm = microsiemens per centimeter
ºC = degree Celsius
EPA = U.S. Environmental Protection Agency
ID = identification
NMAC = New Mexico Administrative Code
NMWQCC = New Mexico Water Quality Control Commission
REG = normal field sample
Spec Cond = Specific Conductivity
S.U. = standard unit

Table 3-1
Groundwater Monitoring Program

[a] The groundwater monitoring network consists of 149 wells that are currently sampled under Solid Waste Management Unit ST106/SS-111. Select wells are identified for additional or more frequent monitoring of risk-driving constituents. Metals analysis consists of select total metals (arsenic, calcium, lead, potassium, magnesium, and sodium) and select dissolved metals (iron and manganese). Anions analysis consists of bromide, chloride, nitrate/nitrite nitrogen, and sulfate. Field parameters include pH, specific conductivity, dissolved oxygen, oxidation reduction potential, temperature, and turbidity.

[b] Well sampled with passive sampling methodology; field parameter measurements are not representative and therefore are not collected.

[c] Well no longer sampled due to safety concerns.

[d] Newly added to the groundwater monitoring network in fourth quarter 2017.

[e] Newly added to the groundwater monitoring network in first quarter 2018.

[f] Newly installed groundwater monitoring well that was completed in fourth quarter 2016.

[g] Newly installed groundwater monitoring well that was completed in third quarter 2018.

[h] In previous reports, groundwater monitoring wells were designated based on their location related to groundwater gradient and the EDB plume or on their location, i.e. “downgradient”, “source area”, etc. However, due to the changing regional groundwater gradient (see Quarter 2 2018 Quarterly Monitoring Report [USACE 2018]), these designations are not always appropriate. To simplify and more accurately represent dynamic hydrologic conditions, all groundwater monitorings wells will be designated simply as “groundwater monitoring well” after completing a baseline sampling of four quarters. Prior to the baseline sampling, the wells will be designated as "newly added".

[g] Monitoring Well Objective:
Newly Added Wells—Newly added wells can include both existing wells that are added to the GWM network as well as newly installed wells. Newly added GWM wells require a minimum of four consecutive quarters of baseline full-suite analytical sampling before receiving a designation that determines the long-term sampling regime. These wells have been added to define the plume boundaries and provide additional water table monitoring due to the rising groundwater elevation.

Source Area Wells—Primarily located in the BFF south of Randolph Road SE and proximal to the spill site on-Base. Sampled during Q2 and Q4. These wells monitor the higher concentrations of dissolved-phase plumes on-Base.

Downgradient Proximal Wells—Located north of Ridgecrest Drive SE surrounding the historical EDB plume to the west, north, and east into the distal portion of the GWM network. Analytical data for these wells have been historically below the maximum contaminant level (MCL) for EDB. Sampled every quarter. These wells assist in plume boundary definition.

Veterans Affairs (VA) Proximal Wells—Three sets of nested wells located between the historical EDB plume south of Ridgecrest Drive SE and the Raymond G. Murphy VA Medical Center as a means to detect any potential contaminant migration towards the VA medical campus. Sampled every quarter. These wells provide additional wellhead protection monitoring for the VA supply well.

Signal Wells—Three wells located along the south side of Ridgecrest Drive SE to monitor benzene, toluene, ethylbenzene, and total xylenes (BTEX) and provide early indication if the benzene plume is migrating from the source area into the interim measure target area capture zone created by the groundwater extraction wells. Sampled during Q2 and Q4.

Groundwater Monitoring Wells—Primarily location north of Ridgecrest Drive SE within the historical footprint of the EDB plume. Analytical data from these wells serve to define the volume and mass of the EDB plume throughout the GWM network. Sampled in Q2 and Q4.

BTEX = benzene, toluene, ethylbenzene, and total xylenes

EDB = ethylene dibromide

FP = field parameter
ID = identification

NA = not applicable

VOC = volatile organic compound

APPENDIX C-1

DATA QUALITY EVALUATION REPORT – SOIL VAPOR MONITORING (APRIL–JUNE 2021)

LIST OF ACRONYMS AND ABBREVIATIONS

µg/m3	microgram(s) per cubic meter
%	percent
AFB	Air Force Base
ALS	ALS Environmental
DL	detection limit
DoD	Department of Defense
EPA	U.S. Environmental Protection Agency
LCS	laboratory control sample
LCSD	laboratory control sample duplicate
LOD	limit of detection
LOQ	limit of quantitation
Q2	second quarter of the year (April 1 – June 30)
QAPjP	Quality Assurance Project Plan
QC	quality control
RPD	relative percent different
SDG	sample delivery group
VOC	volatile organic compound

C-1.1 DATA QUALITY EVALUATION REPORT – SOIL VAPOR MONITORING (APRIL–JUNE 2021)

C-1.1.1 Laboratory Data Quality Summary

This Data Quality Evaluation Report describes the findings of the data validation performed for the analysis of soil vapor samples collected during April-June 2021 (quarter 2 [Q2]). These data were collected in support of the Work Plan for Vadose Zone Coring, Vapor Monitoring, and Water Supply Sampling, Bulk Fuels Facility, Solid Waste Management Units ST-106 and SS-111, Kirtland Air Force Base (AFB), New Mexico (Kirtland AFB, 2017). Sampling and analysis for the Q2 2021 event were conducted in accordance with the procedures and overall quality control (QC) and quality assurance protocols presented in the Work Plan and Quality Assurance Project Plan (QAPjP) for Bulk Fuels Facility Vadose Zone Treatability Studies, Solid Waste Management Units ST-106/SS-111, Kirtland AFB, New Mexico (Kirtland AFB, 2017).

Samples discussed in this report were collected during the period of April 5 through June 24, 2021, in association with the Kirtland AFB semiannual soil vapor monitoring program. Sampling was conducted at 299 soil vapor monitoring wells and included the collection of 30 field duplicate samples.

Soil vapor samples were shipped to ALS Environmental (ALS), Simi Valley, California for analysis. ALS maintains current Department of Defense (DoD) Environmental Laboratory Accreditation Program certification for the required analysis in support of this project. Sample analysis was performed in accordance with the U.S. Environmental Protection Agency (EPA) Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air, Method TO-15.

Chemical analytical data for the Q2 2021 event was reported by ALS in 17 sample delivery groups (SDGs). Appendix C-1 – Table 1 summarizes samples collected from the soil vapor monitoring wells and the associated field QC samples, collection date, laboratory SDG, and analytical method for the Q2 semiannual event.

A third-party subcontractor (Environmental Data Services, Inc., Palm Gardens, Florida) conducted EPA Stage 3 data validation on a minimum 23 percent (%) of the Q2 2021 sample data per the QAPjP requirement. All data underwent data verification for completeness and compliance to project requirements. The data that underwent the Stage 3 validation were included in ten SDGs (2101875, 2101894, 2101896, 2101897, 2101902, 2102356, 2102357, 2102358, 2102359, 2103567). Analytical data validation was performed using the quality criteria specified in the following documents, analytical guidelines, and methods:

- Work Plan and QAPjP (Kirtland AFB, 2017)
- EPA Contract Laboratory Program, National Functional Guidelines for Superfund Organic Methods Data Review (EPA, 2014)
- EPA Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air, Method TO-15 (EPA, 1999).

The following QC criteria were included in the EPA Stage 3 validation as applicable to the analytical method:

- Sample preservation and extraction and analysis holding times

- Canister certification and pressure differences
- Canister certification blank
- Laboratory method blank
- Surrogate spike recoveries
- Laboratory control sample (LCS) and LCS duplicate (LCSD) recoveries
- Relative percent difference (RPD)
- Initial and continuing calibrations
- Internal standard area
- Field duplicate sample precision.

Analytical data were reviewed to evaluate precision, accuracy (bias), representativeness, comparability, completeness, and sensitivity as defined below:

- *Precision* is expressed as the RPD between the results of replicate sample analyses: sample duplicates and LCSDs. When analyte RPDs exceed the acceptance criteria, the data are qualified accordingly.

- *Accuracy (bias*) is demonstrated by recovery of target analytes from fortified blank and sample matrices such as the LCS/LCSD samples. For organic methods, bias is also demonstrated through recovery of surrogates from each field and QC sample. A comparison was made from the recovery of target analytes from fortified samples to the acceptance criteria defined in the QAPjP (Kirtland AFB, 2017). When the acceptance criteria are not available in the QAPjP, results are compared with the laboratory in-house control limits. When these criteria are not met, the data are qualified accordingly. Bias may be indicated as high or low.

- *Representativeness* of the samples submitted for analysis is ensured by adherence to standard sampling techniques and standard analytical method protocols.

- *Comparability* of sample results is ensured through the use of approved sampling and analysis methods and comparison of sample results to historical sample data.

- *Completeness* of data is evaluated based on contractual, analytical, and technical completeness for the monthly supply well data. Technical completeness of data is used to assess overall project completeness and is expressed as a percentage of the ratio of the number of usable data results to the total number of analytical data results. Only rejected data (R-qualified) are considered not usable to achieve project objectives.

- *Sensitivity* is determined by the ability to achieve the established method-specific reporting limits in accordance with DoD Quality Systems Manual Version 5.3 (DoD, 2019) requirements and includes establishing the detection limit (DL), limit of detection (LOD), and limit of quantitation (LOQ). For this project, the laboratory reported positive results to the DL and flagged with a “J” qualifier, signifying estimated data. Non-detect results were reported at the LOD with a “U” qualifier per the QAPjP. Sensitivity will be evaluated based on comparison of the sample reporting limits to the project screening levels.

The following sections present the EPA Stage 3 data validation findings for the Q2 2021 soil vapor sample data. Appendix C-1 – Table 2 presents the data qualification flags and reason codes to be applied to analytical data, if required.

C-1.2 DATA QUALITY FINDINGS

C-1.2.1 Sample Receipt and Analysis Holding Times (Reason Code HT)

The vapor samples were shipped ground to the ALS laboratory. No temperature preservation requirement is applicable to vapor samples. The 30-day sample hold time was evaluated by comparing the sample collection date to the sample analysis date. Sample analysis holding times were met for all samples for Q2 2021.

One sample receipt discrepancy was noted by the laboratory. Based on the pressure of the canister for sample SV139-250-212, it appeared the canister may have had a faulty valve. This sample was not analyzed and recollected on May 19, 2021. In addition, samples SV3-007-212, SV3-015-212, and SV3-272-212 were recollected June 24, 2021, to confirm the results from the initial sampling performed in April 2021.

C-1.2.2 Canister Certification and Laboratory Method Blanks (Reason Code CB/MB)

The soil vapor sample results were evaluated with respect to the canister certification blanks and laboratory method blanks prepared and analyzed for each analytical batch. All volatile organic compound (VOC) analytes were non-detect or less than the one-half the LOQ in the canister certification blank samples in accordance with ALS DoD method certification. No samples were qualified based on method blank or canister blank contamination.

C-1.2.3 Initial and Continuing Calibration Blanks (Reason Code CB/CCB)

Initial and continuing calibration blank criteria were reviewed to ensure that the instruments were free of contamination prior to sample analysis. Calibration blank concentrations are considered acceptable when contaminant levels in the blank are less than one-half the LOQ for target analytes and less than the LOQ for common laboratory contaminants. Initial and continuing calibration blank data were within control criteria for all sample analysis.

C-1.2.4 Surrogate Recoveries (Reason Code SURR)

Surrogate compounds are added to field and laboratory QC samples for organic analysis to evaluate the matrix effect and method performance on an individual sample basis. All surrogate compound recoveries for the soil vapor sample data were within method control criteria.

C-1.2.5 Laboratory Control Sample/Laboratory Control Sample Duplicate Recoveries and Precision (Reason Codes LCS/RPD)

The LCS is an aliquot of an analyte-free matrix spiked with target analytes that are prepared with each analytical batch for each analytical method. The recovery of target analytes from the LCS analysis is a measurement of method performance in an interference-free sample matrix. All LCS recoveries for the soil vapor samples were within method control limits with exception of ethyl acetate reported in SDGs 2101875 2101896, 2101897, 2101902, and 2102359; and hexane in SDG 2102357. Sixteen associated sample detections were qualified “J”, signifying estimated results. Appendix C-1 – Table 3 presents the qualified sample results based on LCS recovery.

C-1.2.6 Internal Standard Recoveries (Reason Code IS)

Internal standards are added to all samples including QC samples to monitor the instrumentation sensitivity and response during sample analysis. The internal standard area response and retention times are monitored to ensure they are within the control criteria for the analytical method. All internal standard recoveries were within control limits for the Q2 2021 sample data.

C-1.2.7 Initial and Continuing Calibration Verification (Reason Code CCV)

Instrument calibration is performed for all analyses in accordance with method requirements. The linear analytical range is established for each method by analysis of calibration standards prepared at increasing concentrations that cover the expected sample concentration range. The acceptability of the initial calibration is determined by calculation of a percent relative standard deviation or coefficient.

The stability of the analytical system is monitored by analysis of continuing calibration standards at concentrations near the mid-point of the instrument calibration range. The percent difference values between the relative response factor in the initial calibration and the relative response factor in the continuing calibration are reviewed to ensure instrument calibration criteria are within method control limits. All initial and continuing calibration verifications met the method-specific control criteria for the Q2 soil vapor analytical data with the exception of propylene in SDG 2102358, and propylene, ethyl acetate, and 1,3-butadiene in SDG 2102357. Ten sample results were "J" or "UJ" qualified during validation. Appendix C-1 – Table 3 presents the qualified sample results based on calibration criteria for the Q2 2021 data.

C-1.2.8 Trip Blanks for Volatile Organic Compounds (Reason Code TB)

Trip blank samples were not shipped with the Q2 2021 soil vapor samples as they are not required per the QAPjP but have been periodically collected based on site sampling conditions. Trip blank canisters are not necessarily representative of batch contamination due to the fact that each sample is contained within an individual Summa® canister,

C-1.2.9 Field Duplicate Samples

In accordance with the project QAPjP requirements (Kirtland AFB, 2017), field duplicate samples are collected at a frequency of one field duplicate for every 10 samples collected (10%). For the Q2 2021 sampling event, 30 field duplicate samples were collected in association with 299 soil vapor samples and analyzed for EPA TO-15. Field duplicate samples were collected at a frequency of 10% for the Q2 2021 event.

For field duplicate samples, RPD was evaluated by calculating the RPD between the parent sample and the duplicate sample. The RPD was calculated using the following equation:

$$RPD = |(S-D)/[(S+D)/2]| \times 100$$

where

S = Sample result.
D = Duplicate result.

Acceptable precision control criteria are established at less than or equal to 50% for soil vapor samples. The RPD was calculated between pairs of field duplicate samples when both results are reported at or above LOQ. The results for the soil vapor and the associated field duplicate samples are provided in

Appendix C-1 – Table 4. Five field samples and associated field duplicate results for ethanol, carbon disulfide, toluene, isopropyl alcohol, and propylene were qualified "J" based on exceedance of the RPD criteria and presented in Appendix C-1 – Table 3.

C-1.2.10 Qualified Sample Results Above Project Screening Levels

During Q2 2021 detections above the project screening level for hexane in two samples were "J" qualified as a result of data validation and exceedance of data quality criteria for LCS recovery. Appendix C-1 – Table 5 presents the results for the samples with "J" qualified results above the project screening level. Data validation guidelines determine these data to be usable and achieve project data quality objectives since the results are detections above the project screening levels.

C-1.2.11 Soil Vapor Results with LOQ/PQL Exceeding the Project Screening Level

During Q2 2021, soil vapor sample results were reported with LOQ/PQLs that exceeded the project screening level as a result of the high concentration of target analytes in the samples and therefore, requiring sample dilution during analysis. Elevated concentrations of target analytes in a sample, results in sample dilution during analysis in order to meet DoD QSM and EPA analytical method criteria. When samples require dilution, all analyte reporting limits become elevated by the amount of the dilution and thus resulting in the exceedances listed in Appendix C-1─Table 6. Data validation guidelines determine these data to be usable and achieve project data quality objectives.

C-1.2.12 Professional Judgement

Professional judgement may be applied by a third-party data validation subcontractor or the project chemist during the data review process to apply validation qualifiers based on site-specific and project-specific knowledge, historical data, comparability of data, and analytical expertise. Professional judgement was not applied by the project chemist to qualify Q2 2021 soil vapor data in addition to data qualified during validation by the subcontractor.

Soil vapor samples SV3-007-212, SV3-015-212, and SV3-272-212 were recollected June 24, 2021, to confirm the results from the initial sampling performed in April 2021 since the benzene and EDB results exceeded the project screening level in the initial samples. The June 2021 resampling results did not confirm the initial sample results and it was determined the April sampling results were potentially impacted by the air rotary drilling. Additional sampling of this soil vapor monitoring well will be conducted in October 2021.

C-1.3 COMPLETENESS

The following sections present a discussion of contractual, analytical, and technical completeness for the soil vapor analytical data completeness.

C-1.3.1 Contractual Completeness

Contractual completeness is a quantitative determination of the number of unqualified results compared to the total number of sample results expressed as a percentage, based on data qualified for QC outliers related to analytical method performance. These include data qualified for calibration or method blank contamination, missed holding times, LCS recovery, and/or precision. The contractual completeness goal is 95% per each event. Contractual completeness was calculated as follows:

$$\text{Percent Contractual Completeness} = \frac{\text{Number of Unqualified Results}}{\text{Total Number of Results}} \times 100$$

For the Q2 2021 soil vapor results, the contractual completeness was 99.8% for the TO-15 analytical method (26 qualified analytes for LCS recovery and CCV exceedance out of 14,276 analytes for field and field duplicate samples). The 95% contractual completeness objective was achieved for the semiannual sampling event.

C-1.3.2 Analytical Completeness

Analytical completeness is a quantitative measure of the number of unqualified data results compared to the total number of results expressed as a percentage, based on the target analytes qualified for exceedances of QC requirements from calibration, LCS, surrogate, method precision, and blank contamination results. The analytical completeness goal is 90% for the project per the QAPjP (Kirtland AFB, 2017). Analytical completeness was calculated as follows:

$$\text{Percent Analytical Completeness} = \frac{\text{Number of Unqualified Results}}{\text{Total Number of Results}} \times 100 =$$

Overall analytical completeness for Q2 2021 is 99.7% (36 qualified analytes out of 14,276 analytes for field and field duplicate samples) based on LCS recovery, field duplicate and RPD exceedance, and calibration verification exceedance.

C-1.3.3 Technical Completeness

Technical completeness is a quantitative measure of the data usability based on the number of rejected data compared to the total number of sample results. The technical completeness goal for each method is equal to or greater than 95% per the QAPjP (Kirtland AFB, 2017). The technical completeness calculation considers all data that are not rejected (R-qualified) to be usable data to achieve project objectives. The technical completeness was calculated as follows:

$$\text{Percent Technical Completeness} = \frac{\text{Number of Usable Results}}{\text{Total Number of Results}} \times 100$$

The project data quality objectives were achieved for the semiannual soil vapor sampling event. The technical completeness for the Q2 2021 data is 100%. Technical completeness is provided in Appendix C-1 – Table 7.

C-1.3.4 Data Analysis Completeness

As a part of the data review process, chain-of-custody forms and project data deliverables are reviewed against the project requirements in the Work Plan (Kirtland AFB, 2017) to ensure compliance with the sampling plan and that analytical results were reported for all planned methods and samples. Data completeness for the soil vapor monitoring data deliverables was determined to be 100% complete. Level II analytical data packages are provided in Appendix C-2. Level IV data packages are available upon request.

C-1.4 REPRESENTATIVENESS AND COMPARABILITY

Semiannual soil vapor sampling was conducted in accordance with the sampling and analysis protocols and standard operating procedures documented in the Work Plan (Kirtland AFB, 2017). Approved procedures were used to collect, document, and ship samples to the ALS laboratory, thus ensuring the samples collected were representative of the soil vapor monitoring wells.

ALS maintains current DoD Environmental Laboratory Accreditation Program certification and adhered to the analytical methods documented in the project QAPjP and DoD Quality Systems Manual requirements to prepare and analyze samples and report the data. These certifications ensure the comparability of the analytical results between different samples and different sampling events.

EPA Stage 3 validation was performed on a minimum of 23% of the analytical data and data verification was performed on the remainder to verify that the laboratory complied with the project QAPjP and method requirements. QC results that exceeded method control criteria resulted in data qualification as presented in the previous sections. Based on a review of the completed sample collection logs, chain-of-custody forms, sample receipt forms, and laboratory data packages, the analytical data reported for the semiannual soil vapor sampling achieved the project data representativeness and comparability requirements.

C-1.5 SENSITIVITY

Data sensitivity for the semiannual soil vapor analytical data was achieved by complying with the analytical method guidelines specified in the project QAPjP. Project reporting limits are presented in the QAPjP, Attachment 2, Table 2-1. Non-detect analytes are reported at the LOD and flagged "U." Detections of target analytes below the method LOQ are "J" flagged as estimated values per the project requirements.

Q2 soil vapor samples required dilution during analysis as deemed necessary by the laboratory in order to bring elevated concentrations of analytes into the instrument calibration range for quantitation. Q2 samples requiring dilution due to elevated analytes in the sample (target or non-target) resulted in elevated reporting limits for all analytes in the sample per standard analytical method protocol.

During Q2 soil vapor sample analysis, no data were reported at elevated reporting limits unless associated with other elevated analytes in the sample matrix. Data qualified "J" and "UJ," and data with elevated reporting limits are usable to achieve data quality objectives. Q2 samples were analyzed in accordance with DoD QSM and EPA analytical methodology and 100% technical data completeness was achieved for the Q2 soil vapor data.

C-1.6 CONCLUSIONS

The analytical data reported for the Q2 2021 semiannual soil vapor monitoring have been reviewed for precision, accuracy (bias), representativeness, comparability, completeness, and sensitivity (23% of data) and verified for completeness and compliance (100% of data). Data quality criteria exceedances were noted for field duplicate sample RPD, LCS recovery exceedance, and instrument calibration verification exceedance. Data quality exceedances resulted in "UJ," and "J" qualified (non-detect and estimated) sample results. Estimated data are usable to achieve project objectives. The 95% technical completeness goal was achieved for the Q2 2021 sampling event. All data are usable to achieve the project data quality objectives.

[a] VOCs analyzed in accordance with EPA Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air, Method TO-15.

[b] Sample was recollected due to faulty canister valve.

-- = no comments

EPA = U.S. Environmental Protection Agency

ID = Identification

VOC = Volatile organic compound

Table C-1-2
Data Qualification Flags and Reason Codes

Data Qualifier Definitions for Data Validation

Qualifier	Definition
	No Qualifier indicates that the data are acceptable both qualitatively and quantitatively.
U	The analyte was analyzed for but was not detected above the detection limit. The value associated with the U-qualifier is the limit of detection.
J	The analyte was analyzed for and was positively identified, but the reported numerical value may not be consistent with the amount actually present in the environmental sample. Results are estimated, although the data are considered usable and may be used as appropriate to meet project objectives. Results are qualitatively acceptable and quantitatively uncertain.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
R	The analyte was analyzed for, but the presence or absence of the analyte has not been verified. Re-sampling and re-analysis may be necessary to confirm or deny the presence of the analyte. Results are rejected, and data are unusable for any purposes.
X	The sample results were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project QC criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (includes project chemist).

Reason Codes for Data Validation

Reason Code	Description
CB/CCB	Calibration blank or continuing calibration blank outside of control limits
CCV	Calibration verification outside of control limits
EB	Equipment rinse blank contamination
FB	Field blank contamination
FD	Field duplicate sample results out of control criteria
HT	Holding time exceedance
ICS	Interference check sample
LCS	Laboratory control sample recovery out of control criteria
MB	Method blank contamination
MS/MSD	Matrix spike/matrix spike duplicate recovery outside of control criteria
RPD	Relative percent difference outside of control limits
SD	Inductively coupled plasma serial dilution out of control criteria
SURR	Surrogate recovery outside of control limits
TB	Trip blank contamination

Table C-1-3
Qualified Sample Results, Q2 2021

Well Location ID	Sample Name	Sample Delivery Group	Collection Method	Sample Type	Analyte	Data Qualifier	Validation Reason Code
SVMW-10-150	SV10-150-212	P2102357	SUMMA	N	Propylene (propene)	J	Continuing Calibration Verification
SVMW-10-250	SV10-250-212	P2102358	SUMMA	N	Propylene (propene)	J	Continuing Calibration Verification

FD = field duplicate

ID = identification

N = normal field sample

RPD = relative percent difference

J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.

U = Qualifier denotes the analyte was analyzed for but was not detected above the detection limit.

Table C-1-4
Field Duplicate Sample Results – Soil Vapor, Q2 2021

ID = identification
LOD = limit of detection
ND = not detected above the detection limit
Val Qual = validation qualifier
VOC = volatile organic compound
REG = normal field sample
$\mu g/m^3$ = microgram per cubic meter
Shading = detected concentrations above the detection limit
Qualifiers:
Val Qual based on independent data validation.
J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.
U = Qualifier denotes the analyte was analyzed but not detected above the detection limit. The value associated with the U-qualifier is the LOD.
-- = Validation qualifier not assigned.

Table C-1-5
Qualified Sample Results Above Project Screening Levels, Q2 2021

Well Location ID	Field Sample ID	Sample Date	Sample Type	Analytical Method	Analyte	Result	LOD	Unit	Val Qual	Validation Reason Code	Project Screening Level [a]
SVMW-10-050	SV10-050-212	4/20/2021	N	TO-15	Hexane	3,300,000	10,000	µg/m^3	J	LCS	24,300
SVMW-10-100	SV10-100-212	4/20/2021	N	TO-15	Hexane	340,000	2,800	µg/m^3	J	LCS	24,300

[a] The project screening level equals the New Mexico Environment Department Vapor Intrusion Screening Level for Residential Soil Gas (2019).

µg/m^3 = microgram per cubic meter

ID = identification

LCS = laboratory control spike

LOD = limit of detection

N = Field sample

Val Quals based on independent data validation

J = Denotes the analyte was positively identified, but the associated numerical value is estimated.

Table C-1-6
Soil Vapor Results with PQLs Exceeding the Project Screening Level, Q2 2021

[a] The MDL is equivalent to the DoD DL.

[b] The RDL is equivalent to the DoD LOD.

[c] The PQL is equivalent to the DoD LOQ.

[d] The project screening level equals the New Mexico Environment Department Vapor Intrusion Screening Level Residential Soil Gas (2019).

< = less than

DL = detection lmit

DoD = Department of Defense

EPA = U.S. Environmental Protection Agency

FD = field duplicate

ID = identification

J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.

LOD = limit of detetion

LOQ = limit of quantitation

MDL = method detection limit

N (in "sample_type_code" column)= normal

NS = not specificed

PQL = practical quantitation limit

Q2 = second quarter

RDL = report detection limit

RSL = regional screening level

U = Qualifier denotes the analyte was analyzed but not detected above the detection limit. The value associated with the U-qualifier is the LOD.

µg/m^3 = microgram per cubic meter

Gray highlighting indicates that the result exceeds the Project Screening Level.

Table C-1-7
Technical Data Completeness, Q2 2021

Analytical Parameter	Field/Field Duplicate Sample Analytes	Quality Control Sample Analytes (TB)	Qualified Analytes	Percent Technical Completeness[a]
VOCs (TO-15)	14,276	0	36	100

[a] Percent technical completeness including analytes qualified as estimated data. No data were rejected.

TB = trip blank

VOC = volatile organic compound

LABORATORY REPORT

April 28, 2021

Pamela Moss
EA Engineering, Science, and Technology, Inc.
7995 E. Prentice Ave, Suite 206E
Greenwood Village, CO 80111

RE: Kirtland AFB Bulk Fuels Facility / 62735DM02

Dear Pamela:

Enclosed are the results of the samples submitted to our laboratory on April 9, 2021. For your reference, these analyses have been assigned our service request number P2101875.

All analyses were performed according to our laboratory's NELAP and DoD-ELAP-approved quality assurance program. The test results meet requirements of the current NELAP and DoD-ELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP and DoD-ELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. Results are intended to be considered in their entirety and apply only to the samples analyzed and reported herein.

If you have any questions, please call me at (805) 526-7161.

Respectfully submitted,

ALS | Environmental

By Hayden Akers at 4:53 pm, Apr 28, 2021

Hayden Akers
Project Manager

Client: EA Engineering, Science, and Technology, Inc. Service Request No: P2101875
Project: Kirtland AFB Bulk Fuels Facility / 62735DM02

CASE NARRATIVE

The samples were received intact under chain of custody on April 9, 2021 and were stored in accordance with the analytical method requirements. Please refer to the sample acceptance check form for additional information. The results reported herein are applicable only to the condition of the samples at the time of sample receipt.

Volatile Organic Compound Analysis

The samples were analyzed for volatile organic compounds in accordance with EPA Method TO-15 from the Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air, Second Edition (EPA/625/R-96/010b), January, 1999. This procedure is described in laboratory SOP VOA-TO15. The analytical system was comprised of a gas chromatograph / mass spectrometer (GC/MS) interfaced to a whole-air preconcentrator. This method is included on the laboratory's NELAP and DoD-ELAP scope of accreditation. Any analytes flagged with an X are not included on the NELAP or DoD-ELAP accreditation.

The spike recovery for analyte in the Duplicate Laboratory Control Sample (DLCS) identified as Ethyl acetate was outside the upper control criterion. Recovery in the associated Duplicate Laboratory Control Sample (DLCS) meets the laboratory generated acceptance limits. No further corrective action was taken.

Manual integrations were performed on the following samples and analytes. Refer to the raw data for additional information.

Sample Identification(s)	Analyte(s)
P2101875-002,021	Acetone
P2101875-006,012,023	Propene

The containers were cleaned, prior to sampling, down to the method reporting limit (MRL) reported for this project. For projects requiring DoD QSM 5.3 compliance canisters were cleaned to <1/2 the MRL. Please note, projects which require reporting below the MRL could have results between the MRL and method detection limit (MDL) that are biased high.

The results of analyses are given in the attached laboratory report. All results are intended to be considered in their entirety, and ALS Environmental (ALS) is not responsible for utilization of less than the complete report.

Use of ALS Environmental (ALS)'s Name. Client shall not use ALS's name or trademark in any marketing or reporting materials, press releases or in any other manner ("Materials") whatsoever and shall not attribute to ALS any test result, tolerance or specification derived from ALS's data ("Attribution") without ALS's prior written consent, which may be withheld by ALS for any reason in its sole discretion. To request ALS's consent, Client shall provide copies of the proposed Materials or Attribution and describe in writing Client's proposed use of such Materials or Attribution. If ALS has not provided written approval of the Materials or Attribution within ten (10) days of receipt from Client, Client's request to use ALS's name or trademark in any Materials or Attribution shall be deemed denied. ALS may, in its discretion, reasonably charge Client for its time in reviewing Materials or Attribution requests. Client acknowledges and agrees that the unauthorized use of ALS's name or trademark may cause ALS to incur irreparable harm for which the recovery of money damages will be inadequate. Accordingly, Client acknowledges and agrees that a violation shall justify preliminary injunctive relief. For questions contact the laboratory.

Sample Acceptance Check Form

Client: EA Engineering, Science, and Technology, Inc. Work order: P2101875

Project: Kirtland AFB Bulk Fuels Facility / 62735DM02

Sample(s) received on: 4/9/2021 Date opened: 4/9/2021 by: ADAVID

Note: This form is used for all samples received by ALS. The use of this form for custody seals is strictly meant to indicate presence/absence and not as an indication of compliance or nonconformity. Thermal preservation and pH will only be evaluated either at the request of the client and/or as required by the method/SOP.

		Yes	No	N/A
1	Were **sample containers** properly marked with client sample ID?	☒	☐	☐
2	Did **sample containers** arrive in good condition?	☒	☐	☐
3	Were **chain-of-custody** papers used and filled out?	☒	☐	☐
4	Did **sample container labels** and/or tags agree with custody papers?	☒	☐	☐
5	Was **sample volume** received adequate for analysis?	☒	☐	☐
6	Are samples within specified holding times?	☒	☐	☐
7	Was proper **temperature** (thermal preservation) of cooler at receipt adhered to?	☐	☐	☒
8	Were **custody seals** on outside of cooler/Box/Container?	☒	☐	☐
	Location of seal(s)? Box sealing, Sealing Lid?	☒	☐	☐
	Were signature and date included?	☒	☐	☐
	Were seals intact?	☒	☐	☐
9	Do containers have appropriate **preservation**, according to method/SOP or Client specified information?	☐	☐	☒
	Is there a client indication that the submitted samples are **pH** preserved?	☐	☐	☒
	Were **VOA vials** checked for presence/absence of air bubbles?	☐	☐	☒
	Does the client/method/SOP require that the analyst check the sample pH and if necessary alter it?	☐	☐	☒
10	**Tubes:** Are the tubes capped and intact?	☐	☐	☒
11	**Badges:** Are the badges properly capped and intact?	☐	☐	☒
	Are dual bed badges separated and individually capped and intact?	☐	☐	☒

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.
L = Laboratory control sample recovery outside the specified limits, results may be biased high.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.
L = Laboratory control sample recovery outside the specified limits, results may be biased high.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.
L = Laboratory control sample recovery outside the specified limits, results may be biased high.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.
L = Laboratory control sample recovery outside the specified limits, results may be biased high.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
L = Laboratory control sample recovery outside the specified limits, results may be biased high.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.
L = Laboratory control sample recovery outside the specified limits, results may be biased high.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.
L = Laboratory control sample recovery outside the specified limits, results may be biased high.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.
L = Laboratory control sample recovery outside the specified limits, results may be biased high.

56-23-5	Carbon Tetrachloride	**72**	2.4	0.80	0.35	

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.
L = Laboratory control sample recovery outside the specified limits, results may be biased high.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.
L = Laboratory control sample recovery outside the specified limits, results may be biased high.

LABORATORY REPORT

April 30, 2021

Pamela Moss
EA Engineering, Science, and Technology, Inc.
7995 E. Prentice Ave, Suite 206E
Greenwood Village, CO 80111

RE: Kirtland AFB Bulk Fuels Facility / 62735DM02

Dear Pamela:

Enclosed are the results of the samples submitted to our laboratory on April 9, 2021. For your reference, these analyses have been assigned our service request number P2101894.

All analyses were performed according to our laboratory's NELAP and DoD-ELAP-approved quality assurance program. The test results meet requirements of the current NELAP and DoD-ELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP and DoD-ELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. Results are intended to be considered in their entirety and apply only to the samples analyzed and reported herein.

If you have any questions, please call me at (805) 526-7161.

Respectfully submitted,

ALS | Environmental

By Hayden Akers at 8:26 am, Apr 30, 2021

Client: EA Engineering, Science, and Technology, Inc. Service Request No: P2101894
Project: Kirtland AFB Bulk Fuels Facility / 62735DM02

CASE NARRATIVE

The samples were received intact under chain of custody on April 9, 2021 and were stored in accordance with the analytical method requirements. Please refer to the sample acceptance check form for additional information. The results reported herein are applicable only to the condition of the samples at the time of sample receipt.

Volatile Organic Compound Analysis

The samples were analyzed for volatile organic compounds in accordance with EPA Method TO-15 from the Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air, Second Edition (EPA/625/R-96/010b), January, 1999. This procedure is described in laboratory SOP VOA-TO15. The analytical system was comprised of a gas chromatograph / mass spectrometer (GC/MS) interfaced to a whole-air preconcentrator. This method is included on the laboratory's NELAP and DoD-ELAP scope of accreditation. Any analytes flagged with an X are not included on the NELAP or DoD-ELAP accreditation.

The spike recoveries of ethyl acetate for the Laboratory Control Samples (LCS/LCSD) analyzed on April 22 and 23, 2021 were outside the DoD specified limits but within the Laboratory generated control criterion. The recovery error equates to a potential high bias. No further corrective action was taken.

The upper control criterion was exceeded for 1,3-butadiene in the closing Continuing Calibration Verification (CCV) analyzed on April 22 and for Isopropanol in the opening and closing CCV analyzed on April 23, 2021. Therefore, a potential for a high bias exists for those associated sample concentrations reported with positive results. The data has been qualified accordingly.

Manual integrations were performed on the following sample(s) and analyte(s). Refer to the raw data for additional information.

Sample Identification(s)	Analyte(s)
P2101894-002, 013, 015, 022, 023	Propene
P2101894-002, 003, 008, 018, 022, 023	Acetone
P2101894-003	Hexane
P2101894-017	2-Butanone, Bromodichloromethane
P2101894-021	n-Nonane

Project: Kirtland AFB Bulk Fuels Facility / 62735DM02

The containers were cleaned, prior to sampling, down to the method reporting limit (MRL) reported for this project. For projects requiring DoD QSM 5.3 compliance canisters were cleaned to <1/2 the MRL. Please note, projects which require reporting below the MRL could have results between the MRL and method detection limit (MDL) that are biased high.

The results of analyses are given in the attached laboratory report. All results are intended to be considered in their entirety, and ALS Environmental (ALS) is not responsible for utilization of less than the complete report.

Use of ALS Environmental (ALS)'s Name. Client shall not use ALS's name or trademark in any marketing or reporting materials, press releases or in any other manner ("Materials") whatsoever and shall not attribute to ALS any test result, tolerance or specification derived from ALS's data ("Attribution") without ALS's prior written consent, which may be withheld by ALS for any reason in its sole discretion. To request ALS's consent, Client shall provide copies of the proposed Materials or Attribution and describe in writing Client's proposed use of such Materials or Attribution. If ALS has not provided written approval of the Materials or Attribution within ten (10) days of receipt from Client, Client's request to use ALS's name or trademark in any Materials or Attribution shall be deemed denied. ALS may, in its discretion, reasonably charge Client for its time in reviewing Materials or Attribution requests. Client acknowledges and agrees that the unauthorized use of ALS's name or trademark may cause ALS to incur irreparable harm for which the recovery of money damages will be inadequate. Accordingly, Client acknowledges and agrees that a violation shall justify preliminary injunctive relief. For questions contact the laboratory.

U = Undetected at the limit of detection: The associated data value is the limit of detection, adjusted by any dilution factor used in the analysis.
LOQ = Limit of Quantitation - The minimum quantity of a target analyte that can be confidently determined by the referenced method.
J = The result is an estimated concentration that is less than the LOQ but greater than or equal to the MDL.
B = Analyte detected in both the sample and associated method blank.
